Q. What difference would you make between the delivery of five or six thousand, all at one time, on the Missouri River, or supplying the different points at different times as the cattle were wanted?—A. I would make about $2 50 a hundred in favor of the delivery at one time. However, I cannot answer the question generally. Cattle on the plains, like the market, depend entirely on the quantity and quality. I would make $2 50 difference between delivering after November and delivering in the summer. Between six thousand head all at one time and delivering them at different times I would make a dollar a head difference.

Q. Suppose there were four thousand to be delivered at one time, what difference would you make between such a proposition and to deliver them at different times as they were wanted?—A. I would make a difference of a dollar and a half a head.

WASHINGTON, D. C., *February* 6, 1871.

ROBERT MCBRATNEY sworn and examined.

By Mr. SARGENT:

Question. State your residence and occupation.—Answer. My residence is Junction City, Kansas. My occupation is that of an attorney.

Q. In what courts do you practice?—A. In the district and supreme court of the State, and in the courts here in Washington.

Q. Were you present at the time that payment was made to the Quapaw Indians?—A. Not during the whole payment; I was present during a part of it.

Q. How did you happen to be there?—A. I happened to be there on business which did not at all relate either to the Senecas or to the Quapaws. I went there for the purpose of meeting Batiste, one of the Peoria chiefs. He had no interest in the payment made there.

Q. Were you an attorney for the Indians?—A. Not for any of the Quapaws; I was for Batiste.

Q. In what matters?—A. In the matter of securing the last treaty which the Peorias had made in 1866, I think, and also in the matter of procuring the passage of a bill through Congress for a division of their funds. The Peorias are fragments of different bands.

Q. Are those bands now mixed with the Quapaws?—A. No, sir; they still maintain a separate organization.

Q. How happened Batiste to be there?—A. We met there by appointment. Their new home is below that of the Quapaws and Senecas. Batiste did not come the first day, and consequently I stayed over the second day to meet him.

Q. Why was that time and place appointed for the meeting?—A. Because we both desired to see the Senecas. I had some other business there also. I am engaged for some New York Indians, who think they have a claim against the Delawares, and I thought to meet them there.

Q. Did you obtain any fees from the Indians that you represented?—A. I did.

Q. How much?—A. I cannot say exactly, but I suppose I have had altogether $2,000.

Q. Have you a contingent fee for your services with the Peorias?—A. No, sir; that business is all concluded now.

Q. Was the business concluded at that time?—A. No, sir. If you desire it, I will state the business and the compensation.

Mr. SARGENT. I would like to have you state it.

WITNESS. For assisting them in regard to their treaty, which was made in 1866, my compensation was $500. The compensation which I received for my services last summer amounted to $1,400. The chief, Batiste, had the power of attorney and the contract, and he simply employed me to assist him in getting those matters attended to here and through the Departments.

Q. What time did you get there at that place?—A. I got to Seneca, which is just outside of the reservation, the second day before the payment, in the afternoon.

Q. Were you present at the speech made by General Blunt the day before the payment?—A. I was present at a talk which took place between General Blunt and the commissioners who were present, and heard the whole of it, I think.

Q. Were you present at the speech which was made in the presence of the Indians and the commissioners by General Blunt?—A. I suppose I was present at the matter referred to. It was not a regular set speech that was made.

Q. State what was said in that speech or talk by General Blunt?—A. It was more in a conversational way than in the way of a speech. General Blunt got the commissioners together. The Indians were waiting for Williamson, who was expected that day, and consequently they had all gathered there. My memory has not been refreshed since the time it took place, but I will state as nearly as I can recollect what took place. My recollection is that General Blunt called the commissioners together in front of one of the cabins of the agency and stated that he had heard there was some difficulty in regard to the payment of his fee; and he then went on and stated that he had a contract (they were all sitting at the time in a circle, and a number of Indians listening) with the Indians to procure them compensation for property of theirs lost and destroyed during the war; that he had a contract for a fee of one-third of what might be recovered; and that the contract was made with the full knowledge of the parties who had signed it, and also with the knowledge of the Government agents and the Government officers; and that he had assurances from the Indians that they were still entirely satisfied with the contract. Mr. Hoag, the superintendent, and Mr. Lang, who I understood to be of the commission, objected that the price agreed upon was exorbitant and such as the Indians ought not to pay. There was considerable talk back and forth between General Blunt and the commissioners, the purport of which was that the commissioners objected to the amount of the fee, or to any fee at all being paid, while Blunt claimed that the services which he had rendered would not be more than paid for by the fee; that he had expended a great deal of money and of time; that the fee was contingent; that he had taken all the risks and made all the expenditures; and that he was satisfied that he ought to have the contract carried out according to its terms.

Q. Do you recollect anything further that was said there at the time? State all that you recollect about the talk.—A. I think I have stated the general outline of it.

Q. Did General Blunt state at that time how much money he had paid out?—A. No, I do not think he stated specifically how much money he had paid out.

Q. Did he say how much he would still have to pay?—A. No, he did not say so specifically. He said that he had to pay out large sums.

Q. Did he state to whom he had to pay them?—A. No, he did not; but I remember a little incident which took place at the time, in which one of the commissioners jumped at the conclusion as to why he had paid it when he stated that he had paid out large sums. That was Mr. Lang.

Q. What did Mr. Lang say?—A. General Blunt made the remark that he had to pay large sums in order to get the appropriation through. The old gentleman made a remark something to this effect: "Yes, he had to pay it to members of Congress, to hire them to put the thing through, the members of committees, &c.," and he went on to moralize on that by saying that it was an awful state of things, when Blunt interposed and said that he had paid nothing to Congressmen, but that he had paid others who had assisted him in presenting the matter to Congressmen.

Q. Did he state who those other parties were?—A. No, sir.

Q. Were you present next day when the payment was made?—A. I was present when the payment commenced, and I staid until it was found out that the whole thing could not be completed that day.

Q. How was the payment made? Describe the process.—A. As I recollect it, the payment was made at a long table by Mr. Williamson, who had his money in packages. He had the names of the claimants on a list before him; and Mr. Jocknick had also a list. The names of the Indians on the list were called as they occurred, and the Indians were called by the interpreter at the door. The Indian came in, and the amount to which he was entitled was announced to him, and interpreted to him if he did not understand English, and then it was placed in his hand by Mr. Williamson, and he was told that that was the amount to which he was entitled.

Q. Did anybody else handle the money except Williamson and the Indian?—A. Not until the Indian had it.

Q. What did the Indian do with it?—A. The Indian then carried it to another table in the same room at which the agent, Mr. Mitchell, was sitting, and General Blunt, with one of the Friends, Mr. Earl, I think, who I understood was not one of the commissioners. Mr. Earl took charge of the money and counted it, and if the agent had any claim against the Indian that amount was taken out by Mr. Earl, and then the amount that was claimed by General Blunt was counted out, and the residue was handed to the Indian by Mr. Earl.

Q. What was the nature of the claims of the agent?—A. There had been orders, given in anticipation of the payment, on a trader residing in Seneca, for groceries and supplies. The orders, as I understood it at the time, contained an agreement to pay the merchant when the money was paid to the Indians.

Q. Could the Indians count the money for themselves?—A. Not all of them; I should think that a good many of them could. I am not sufficiently well acquainted with those Indians to answer that question.

Q. What was the nature of the money?—A. Paper money—greenbacks. It was new money.

Q. At the time of the talk to which you referred did General Blunt appeal to the Indians any way as to whether they would go back on him or not?—A. No, sir; I do not recollect his doing so.

Q. Is your memory distinct as to that?—A. My memory is distinct that I did not hear him make an appeal of the kind, although such an appeal may have been made without my hearing it, because I was myself sometimes mixed up in conversation, and at such times an appeal of that kind might have been made. That matter, however, was talked about among Indians with whom we were mixed up.

Q. Did General Blunt address himself to the Indians at all in talking?—A. No, sir; I did not see him or hear him at any time address himself to the Indians. He came to the commissioners there for the express purpose of talking to them in regard to his contract, and explaining the whole matter fully.

Q. Was it not arranged that there should be a speech by General Blunt to the Indians before the commissioners arrived there?—A. I know of no such arrangement.

Q. You think that the only object of the speech was to convince the commissioners that 33⅓ per cent. was a reasonable fee for the services he had rendered?—A. I think the object of General Blunt was to satisfy them that he was dealing openly and fairly with the Indians and with their understanding, and that he was not taking any advantage of them.

Q. Did you see any powers of attorney?—A. I think I did.

Q. Were there many exhibited at that time?—A. I think there were, but I did not pay any attention to them. I did not pretend to have any participation in the meeting; I was simply a listener. I think there were powers of attorney exhibited, but whether the commissioners went into the examination of them or not, I cannot say; I did not examine them myself.

Q. Were you there in any sense to help Blunt?—A. No, sir. I desire to say that I had no interest at all with him; it was more a matter of curiosity on my part than anything else which took me there.

Q. Had you been at any previous meeting of annuities to Indians?—A. I had been to payment of other tribes frequently.

WASHINGTON, D. C., *February* 6, 1871.

THOMAS J. BUCKLEY recalled.

By Mr. CHIPMAN:

Question. Since your return to New York City, have you examined with reference to the item of $1,000 paid to your favor for flour, to which your attention was called by Mr. Lawrence, a member of the committee? If so, state what you learned in reference to it.—Answer. I found on our books that on the 7th of December we received some vouchers from Black & Story, of Montana, which were inclosed by us to the Indian Department for payment. They were indorsed by Black & Story to Buckley, Welling & Co. They were sent to us for collection. We forwarded them to Washington, and on the 27th of December we received payment of $1,000. That is the only item of $1,000 of which I have any knowledge in connection with the Indian Department, and I presume that that is the item for flour.

Q. Your firm had no interest in it?—A. No, sir.

Q. Do you know anything about the payment of a certain large sum of money by Mr. Bosler to DeWitt C. Wheeler?—A. Mr. Wheeler had been interested in the Little Rock and Fort Smith Railroad to a very large amount. In July or August, 1870, Mr. Bosler was in the store several times talking to Mr. Wheeler in reference to making a purchase of some of the bonds of that road. After he left Mr. Wheeler stated to me that he wanted to sell Mr. Bosler a lot of those bonds, and that he thought he would be able to do so. On one occasion I came into the office as Mr. Bosler left it, and Mr. Wheeler remarked to me that he had effected a sale of about $60,000 of bonds to Mr. Bosler. After that Mr. Wheeler received a check or draft from Mr. Bosler in payment of sixty thousand and some hundred dollars, which draft he handed to me. He said it was in payment of some bonds of the Little Rock and Fort Smith Railroad. That draft, I think, was drawn by Mr. Bosler on Jay Cooke & Co., of New York. I said to him that I wished he would sell out these railroads, as they were taking up too much of his time. He said that that was what he wanted to do. Instead of doing so he afterward came to me and asked me if I would not join him in an interest in the Cairo and Fulton road. I told him that I would not, and that I hoped he would have nothing to do with it. After that Mr. Denkler, Mr. Webb, and Mr. Caldwell came into the store and Mr. Wheeler went with them, and said he had bought an interest in the Cairo and Fulton road. After that Mr. Bosler came into the store and I asked him if he was interested in the Cairo and Fulton road? He said he was not, but that he wanted to get an interest in it and was not able. Still after that, along in September, he stated to me that he had sold a portion of his interest to Mr. Bosler for some $12,000 or $14,000. I told him I was very sorry to hear that he had got into it; that it was taking up too much of his time, and that I disapproved of it.

Q. Did the check come to him for that last amount also?—A. He got a check for it. I did not see that $14,000 check.

By Mr. WELSH:

Q. State whether you made any arrangement with the manufacturers of blankets to bid for them?—A. We proposed an arrangement. I believe Mr. Dobson accepted it, and afterward backed out of it.

Q. At whose instance did he back out? Did you hear?—A. I have not heard Mr. Dobson say so; I understood that it was Mr. Stewart who requested him to put in a bid himself.

WASHINGTON, D. C., *February* 6, 1871.

HENRY C. FAHNESTOCK sworn and examined.

By Mr. CHIPMAN:

Question. Are you a member of the firm of Jay Cooke & Co., of New York?—Answer. I am.

Q. Have you a dispatch sent by Jay Cooke, of Philadelphia, to you, and your reply?—A. I have.

[Witness presents the following dispatches:]

"Dated PHILADELPHIA, PA., ———— 28, 1871.

[Received at 2.57, one, January 28.]

"To JAY COOKE & CO., *New York City:*

"Send by Monday's mail to H. D. Cooke, Washington, copies and detail of deposits, drafts, and other transactions by J. W. Bosler and General Ely S. Parker, since May last, and have them certified by sub-treasurer. Answer.

"JAY COOKE.

"Dated NEW YORK, *February* 6, 1871.

[Received at Philadelphia.]

To JAY COOKE:

[Copy.] "January twenty-eight. General Parker never had any transactions with us. Bosler, now in office, has had large deposit accounts with us for two years, never asking accommodations, and is entitled to consideration accordingly. Is it proper to send details of his account?

"H. C. FAHNESTOCK.'

WASHINGTON, D. C., *February* 6, 1871.

JOHN T. BALDWIN sworn and examined.

By Mr. SARGENT:

Question. State your residence and occupation.—Answer. I reside in Council Bluffs, Iowa. I am a kind of general trader in real estate, a miller, and other things.

Q. Do you deal in any kind of merchandise?—A. No, sir.

Q. Were you ever present at any conversation between Mr. Finn and the Commissioner of Indian Affairs, at the office of the latter in Washington City; and if so, when was it?—A. I was present with Mr. Finn, I think, about the middle of June, 1870.

Q. State what passed in that conversation between Mr. Finn and Mr. Parker, in relation to a contract.—A. I think Mr. Finn asked Mr. Parker if he should continue to furnish supplies to Indians after the 1st of July. Mr. Parker replied that he did not want him to continue. Mr. Finn asked him what he was going to do with the Indians, and how he would get provisions and supplies. Mr. Parker remarked that he could not make any arrangement for supplies until there was an appropriation by Congress; that the Indians would have to hunt, or to do as they had been doing before they were getting any supplies from the Government.

Q. Was anything said by Mr. Finn with reference to a desire on his part to have another contract?—A. I do not recollect anything.

Q. What was your object in going there?—A. I went in company with Mr. Finn, to see if Mr. Parker did not want some flour for the Indians.

Q. Did you make any proposition to Mr. Parker with reference to it?—A. I simply told Mr. Parker that I had been engaged in furnishing contractors with flour for quite a number of years, and that I would like to make a direct sale to him or to the Government, in place of selling to the contractors.

Q. What was his reply to that?—A. He remarked that he was not prepared to make any contract at that time with me for flour, but that as soon as the appropriation bill passed he would advertise in the Chicago and Omaha papers, and would send me a

copy of the advertisement. I asked him where the letting would take place. He said he did not know, but that it would take place here or at Sioux City.

Q. How soon thereafter did you hear of the Bosler contract being let for beef and flour?—A. I learned it through Mr. Finn some two or three days afterward; that was the first intimation that I had of it; I then saw Mr. Bosler about ten days afterward.

Q. Did Mr. Bosler tell you that he had a contract?—A. Yes, sir.

Q. Was that before the passage of the appropriation bill which passed on 15th July?—A. It was before that; it was in the latter part of June that I saw Mr. Bosler.

Q. Did you receive any copy of an advertisement from Mr. Parker after the appropriation bill passed?—A. No, sir, I did not.

By Mr. WELSH:

Q. Did you name any price for the flour to Mr. Parker?—A. No, sir.

Q. At what rate were you prepared to furnish it then?—A. I would have been willing to have contracted for flour at about $2 50 a sack on the cars at Council Bluff.

Q. Or at the same price on the steamboat?—A. Yes.

Q. What was the average price of flour at Council Bluffs in July, August, and September, 1870?—A. It ranged at about $2 25—from $2 25 to $2 50 per sack of ninety-eight pounds.

Q. Is that a double or a single sack?—A. A single sack.

Q. Do you know Mr. Hoffmeyer, of Council Bluffs?—A. Yes.

Q. Do you know anything of a contract that he had with the Government to furnish flour at $2 15?—A. No, sir; I am a partner of Mr. Hoffmeyer; I was aware of a sale of flour made at the mill; the sale ranged at from $2 to $2 75, according to the quality of the flour; he sold some 1,250 sacks to Mr. Bosler; most of it was sold at $2 75; that was in October.

Q. Do you recollect a sale of flour at $2 15 a sack, bought on October 27 and paid for on November 29?—A. I recollect that.

Q. Do you know to what Indians it went?—A. The sale was made to Governor Campbell, of Wyoming, and was shipped part to Point of Rocks and part to Cheyenne.

Q. Have you any idea of the quantity of flour sold at that time at $2 15?—A. I think there were six hundred sacks shipped to Cheyenne and two hundred to Point of Rocks; there were three car loads to Cheyenne, and we generally put from two hundred and five to two hundred and ten sacks in a car; that would make altogether a little more than eight hundred; that was in October.

WASHINGTON, D. C., *February* 6, 1871.

Captain DE WITT CLINTON POOLE recalled.

By Mr. WELSH:

Question. The kind of sugar that is now shown you, was that the kind received at Whetstone agency under the Bosler contract?—Answer. Yes, sir.

Q. Is that what is called molasses sugar—sugar made from molasses?—A. Yes, sir; I call it dark-brown sugar.

Q. Is it made from molasses?—A. I am not well enough posted to tell you that; it is what I call coarse sugar.

Q. Before the Hutchison lot of cattle arrived there, state whether any preparations had been made for the care of the cattle at Whetstone agency by procuring hay or herders.—A. No, sir; not to my knowledge.

Q. Was it the expectation of the Texas cattle-herder that they were to be delivered immediately?—A. That is what he informed me.

By Mr. CHIPMAN:

Q. What was the quality of cattle delivered by Mr. Bosler under his contract?—A. They were a very excellent quality of cattle.

Q. How was it with the other supplies that were delivered?—A. They were all good supplies for the purposes intended.

Q. Was that sugar as good for the Indians as any other sugar would be?—A. Yes; I think they like it better than they do white sugar; it sweetens more, according to the Indian idea.

Q. Was the Indian service in any way disturbed by too great a supply of provisions at the Whetstone agency?—A. No, sir.

Q. What effect did it have upon the Indians?—A. It had a good effect; a large quantity of supplies always pleases them, particularly when they can see them.

Q. Do you know that the sugar shown you is a part of the sugar delivered at your agency?—A. I do not; it is the same kind of sugar.

By Mr. SARGENT:

Q. Is there any cheaper kind of sugar than that?—A. I do not know.

Q. Have you ever seen a more inferior kind of sugar than that?—A. I have.

By Mr. CHIPMAN:

Q. State what you know about the uneasiness of the Indians in regard to supplies.—A. There was a good deal of uneasiness existing among the Indians about the supplies; it was understood that they would run out on the 30th of June; the Indians had been so informed; a delegation of the principal chiefs had visited this city, and had understood, when they were here, that there were to be no supplies furnished after the 30th of June; they were very anxious about it, and spoke about it when they were over here, to the Commissioner and to the Secretary of the Interior, and to the President.

Q. What effect did the supplies have upon them?—A. It had the effect of quieting their apprehensions.

Q. Were the provisions growing short after the first delivery under the June contract, until the delivery under the extension of August 10?—A. Yes, sir; everything, except beef; we had an abundance of beef.

By Mr. WELSH:

Q. How long were you absent from the reservation?—A. From about the 17th of May till near the latter part of June.

Counsel for Commissioner Parker offers to prove by J. A. Morrow, to whom the contract for beef supplies to the Indian Department, dated September 17, 1870, was let, that—

1. The joint dispatch of Bosler & Morrow, dated September 11, 1870, to the commission, was sent without Bosler's knowledge, previously or at the time, as to what Morrow's bid for beef was.

2. That there will be a loss to the contractor on the Morrow contract, with the most prudent management, of $75,000 or $100,000.

Mr. WELSH objected to the offer of proof.

Mr. SARGENT. It is admitted by the committee that, if Mr. Morrow were present, he would testify as stated in the foregoing paper. The committee makes this ruling, because otherwise it would not be able to make a report at the present session.

Mr. WELSH excepted to the admission.

WASHINGTON, D. C., *February* 8, 1871.

THOMAS E. MCGRAW sworn and examined.

By Mr. CHIPMAN:

Question. How and where are you employed?—Answer. I reside in Washington City. I am a first-class clerk in the Indian Bureau.

Q. Do you remember the original letter signed by John Finn, dated June 9, 1870, offering to furnish beef to the Indian Bureau?—A. Yes, sir.

Q. Examine the letter now shown you and see if it is the orignal letter.—A. Yes, sir; that is the letter.

Q. Was it signed by John Finn in your presence?—A. It was written by me at his dictation, and signed by him in my presence.

Q. The letter now shown you is the original letter, and was taken from the files of the Indian Department?—A. Yes, sir, and was written in the Department.

The letter was read as follows:

"WASHINGTON CITY, D. C., *June* 9, 1870.

"SIR: I have the honor to state that I have a large number of American and Indian cattle, left over from my late contract at the Winnebago Indian agency, which I propose to sell to the Indian Department for the use of the Sioux Indians at the Whetstone agency, at the following prices, viz: American cattle from 4 to 7 years old, at 6¼ cents per pound, gross weight; Texas or Indian cattle at 4¼ cents per pound, gross weight; said cattle to be delivered at Whetstone agency or reservation, as may be required, until the next contract is awarded.

"I am, sir, very respectfully, your obedient servant,

"JOHN FINN.

"Hon. E. S. PARKER,
"*Commissioner of Indian Affairs.*"

WASHINGTON, D. C., *February* 8, 1871.

E. S. PARKER, Commissioner of Indian Affairs, recalled.

The attention of the witness being called to manuscript page 14 of his testimony, he states that he desires to add in addition thereto that he knew of no protest against receiving the beef having been made.

The attention of the witness having also been called to the following question and answer:

"Question. Explain whether you talked with him (Secretary Cox) in regard to supplying the Indians, as provided for in the contract of June 17.

"Answer. I had frequent talks with him in reference to entering into this contract of June 17, and he was aware of the whole of it;"

He adds: "I do not want to say on the record that he was aware of the whole of it, but that he was aware generally of the transactions which resulted in the contract of June 17."

WASHINGTON, D. C., *February* 8, 1871.

General WILLIAM MEYERS recalled and examined.

By Mr. WELSH:

Question. State briefly the circumstances relating to the proposal of J. E. Boyd, of Omaha, so far as relates to his bid for beef under the contract of September 12.—Answer. In the early part of September John McCormick, of Omaha, sent to my office an envelope containing a bid, with the request that I cause it to be sent to General Parker's office on the day of the opening of the bids for beef. I promised that the matter should be attended to. I handed the package to my chief clerk, with special instructions to take that bid to the office on that day. On the day of the letting, some time in the afternoon, Mr. Taylor, of Omaha, came to my office and told me that Boyd's bid had not been read. I then sent for my chief clerk, and on inquiry found that he had neglected to send the bid to the office. I immediately sent him to the office to see General Parker to state the omission, and to request that the bid be considered and read. The contents of the package I was not aware of, nor did I know in whose name the bid was made. My clerk returned and informed me that the bid would not be considered, and also that it was not the lowest bid. That is all I know about it.

By Mr. SARGENT:

Q. Can you state the hour it was first ascertained that the bid had not been sent?—A. I cannot definitely. It must have been some time after one o'clock. It was after the bids had been read, because Mr. Taylor was present when the bids were read.

WASHINGTON, D. C., *February* 8, 1871.

J. W. BOSLER recalled and examined.

By Mr. CHIPMAN:

Q. I call your attention to manuscript page 20 of your deposition, where you have crossed out in pencil the following: "But that, if it did, the President would convene Congress in extra session and ask it to make an appropriation." What have you to say in regard to that expression?—A. That, since I have testified, in considering it, I conclude that I got that information through other parties. It was a general report, among parties familiar with the matter, that Congress would, under the circumstances, be convened. I do not think I got it in this conversation. I am satisfied I did not.

By Mr. WELSH:

Q. How many other partners are in the contract besides yourself and Mr. Morrow?—A. No one but myself and Mr. Morrow. When Mr. Morrow and I went into this agreement he told me he had parties with him, but he is the only man who is known to me, although I know that other parties are in it.

Q. What interest has John McCormick?—A. I do not know. I know that Morrow and his friends represent half the contract, and I have understood that McCormick has an interest, but what interest I do not know.

By Mr. CHIPMAN:

Q. Does the paper now shown you show the Chicago price current for cattle running from June 15 to June 30?—A. Yes, sir.

Q. Are the prices mentioned here for cattle the gross weights?—A. Yes, the gross weights.

[The statements of price current referred to are appended to the testimony.]

Q. Would or not the prices along the Pacific Railroad bear any relation, and if so what, to the Chicago prices?—A. They would be governed entirely by the Chicago prices. In fact, that is the market which controls the prices for all the country west of Chicago.

By Mr. SARGENT:

Q. Are Texas cattle designed to fill contracts at the Indian agencies on the Upper Missouri River brought from Chicago?—A. No, the Texas cattle are driven up west of the Missouri River to certain points, one is Abilene and another Schuyler. The Texas cattle are collected at these two points, and from there shipped to Chicago.

Q. Then the value of these cattle at Abilene is obtained from Chicago?—A. Yes.

Q. But the price at Chicago would be greater than that at Abilene?—A. Yes, and greater than that at Schuyler. It would be enhanced by the cost of shipping from these points to Chicago.

Q. In filling any contract made with the Indian Department to deliver beef cattle at the reservations on the Missouri River, would you go to Chicago to buy these cattle, or would you buy them at Abilene and Schuyler directly from Texas?—A. I will give you my own experience in this case. I went to Schuyler and then came back to Chicago and endeavored to buy cattle there and get the best rates I could from the railroad company. I then made contracts to buy the cattle delivered, and they were purchased at Schuyler or in that locality.

Q. Had these cattle been shipped to Chicago and back again to Schuyler?—A. No, sir.

Q. Then the price current at Chicago is not an unfailing guide in regard to the price of beef cattle delivered on the Missouri?—A. No, sir; it is not.

By Mr. WELSH:

Q. Is it not usual to send the larger cattle to Chicago and the smaller ones to the agencies?—A. No; there were no larger or better cattle delivered in Chicago than those I furnished under this contract. They were from four to seven years old and of the best quality.

WASHINGTON, D. C., *February* 8, 1871.

ALVIN C. LEIGHTON sworn and examined.

By Mr. CHIPMAN:

Question. State your residence and occupation?—Answer. I reside at Omaha. I am a merchant and trader.

Q. How long have you been engaged as a trader?—A. I have been in business in Omaha only a year.

Q. Have you had occasion to carry goods through the Indian country west of the Missouri River?—A. Yes, sir.

Q. State what per cent. of difference you would make in filling a requisition to deliver goods at the Indian agencies along the Missouri River, extending up as high as the Grand River agency, and delivering them along the line of the Pacific Railroad?—A. I have never delivered goods in that country, but I consider the risk a great deal more. I would consider it at least a hundred per cent. in advance of delivering them on the line of the railroad.

Q. Why would you consider the risk greater?—A. From my experience in delivering goods in the Indian country, I would require at least one hundred per cent. more for delivering them in the country you speak of than along the line of the Pacific Railroad, whether cattle or anything else.

Q. Do you know the dangers that are involved in driving cattle through the Indian country?—A. I do, for all kinds of stock. I have been in the Indian country ever since posts have been established along up there. I was at the Powder River post, and in that country until the abandonment of that post.

By Mr. SARGENT:

Q. Have you ever bought and sold cattle?—A. No, I never had anything to do with cattle.

Q. And never had any delivered in that way?—A. No, sir.

By Mr. CHIPMAN:

Q. But I understand that you know something about the risks that are involved?—A. Yes, I have never driven cattle, but I have driven horses and mules, and am familiar with the risk attending the driving of any description of stock.

Q. On what data do you make your estimates?—A. I make them from my own experience in driving horses and mules, and in supplying any kind of goods.

APPENDIX.

House resolution, December 12, 1870.

Resolved, That the Committee on Appropriations be directed to inquire and report to this House what effect, if any, has been given to the following provision of the act "making appropriations for the current and contingent expenses of the Indian Department, and for fulfilling treaty stipulations with various Indian tribes for the year ending June 30, 1871, and for other purposes," namely: "It shall be the duty of said board of Indian commissioners to supervise all expenditures of money appropriated for the benefit of Indians in the United States, and to inspect all goods purchased for said Indians in connection with the Commissioner of Indian Affairs, whose duty it shall be to consult said commission in making purchases of such goods." Also, to what amount moneys have been expended on goods purchased in disregard thereof; also, whether the contracts for the purchase of flour or beef cattle for the Indian tribes on the Missouri River have been corruptly or improvidently made, or for greater quantities than required by the service; also, to investigate the charges of fraud and improvidence against the Indian service made in the report of William Welch, esq., to the Secretary of the Interior; also, whether any portion of the sum of $90,000 appropriated in said act for the Quapaw Indians has been paid to other parties or diverted from its intended use; and that they have power to report at any time, and send for persons and papers.

PHILADELPHIA, *December* 7, 1870.

DEAR SIR: During the last month I visited and conferred with the representatives of twelve tribes of Indians residing on the Missouri River up to the Cheyenne reservation, nine miles above Fort Sully. The President of the United States claimed and obtained the aid of missionary associations of the Protestant Episcopal Church in civilizing and Christianizing most of the Sioux Indians in Dakota Territory. Five agents were nominated by these associations and appointed by the President. The chief object of my visit was to inform the Indians of the beneficent disposition of the President toward his red children, and to give the new agents a favorable introduction, with such advice and assistance as they will surely need in their arduous and self-denying work. The Rev. Samuel D. Hinman accompanied me, rendering most efficient service by his thorough knowledge of the language and habits of the Sioux Indians, to whom he has ministered for ten years with eminent success. We first visited the Yankton Sioux reservation, about sixty miles above the city of Yankton. These Indians number from 2,000 to 2,500. They were made hopeful by the announcement that their Grand Father, as they call the President, had invoked the aid of the church in caring for the Indian, and that hereafter the Government would be represented among them by Christian people. Although this tribe has been forty-five years in amity with this Government, often fighting for it against other tribes of Sioux, yet, by the non-fulfillment of promises, it had, before the establishment of the Christian Church there last year, concluded that all white men were liars, except the missionaries to the Santees and those Christians who sustained them. We reached the Yankton reservation on Saturday evening and chanced, in visiting by moonlight a cluster of tepees, to enter one that was owned by a member of the Presbyterian Church. It was cheering to hear that Christian Indian, so lately a heathen, uniting with the Rev. J. W. Cook, the Episcopal missionary, in singing the praises of our God and Saviour in the Dakota language; the bright fire in the middle of the tent enabling them to read, and us to look with gratitude on the strange scene. From an adjoining tepee we heard the groans of a child dying under the infliction of heathen rites; and presently, as his spirit passed away, there arose a most piteous wail from the whole camp. While these fearful shrieks of the hopeless heathen were still sounding in our ears, we were made hopeful by the strains of praise that came from the Episcopal chapel.

The Santee Christian choristers, after having walked some forty miles that day, were in the chapel chanting and singing, to prepare for the morrow's service. On Sunday morning the contrast between heathenism and Christianity was equally striking. The day was very cold, and the wind furious; yet the heart-broken father and his adult son, both naked, except a girdle about their loins, marched slowly past the chapel,

their heads bent, and their bodies covered with earth, wailing piteously. This occurred just as numbers of Indians, warmly clad in civilized garments, or wrapped in their new blankets, were wending their way to the chapel to unite with us in public worship and to listen to words from the book of life. The chapel was filled with chiefs and Indian soldiers and others; the men outnumbering the women, all seeming reverent and attentive worshippers. A few of them remained after the close of the service, to witness the celebration of the Lord's Supper by the Christian Santee Sioux, and by the whites, including some of the new agents.

Our council with this tribe on the following day was very satisfactory; their desire for civilization being so strong that it pictured to the minds of all who were present a bright future for this long-neglected people. Their noble old head chief, Strike-the-Ree, was so warmed up by the occasion that in his speech he manifested all the fire of youth.

A number of these people have already built houses in anticipation of the division of the land. Out of the 425,000 acres of land included in their reservation, only 14,000 acres have yet been surveyed into 80-acre tracts; no more land suitable for cultivation having yet been found. As all Indians can take up 160 acres of good land outside of their reservations, there does not seem to be any propriety in giving them less than 80 acres within; therefore the reservation should be extended. The Yanktons were, by persuasion or coercion, sent from the broad, fertile bottom land of the lower Missouri to a point where the barren chalk bluffs approach the river very closely. Surely this nation will not begrudge to the Indian the narrow strip of arable land on the east bank of the Missouri, as there are few if any instances of success by white men in tilling this soil, so subject to drought. Farming there is a mere cover for keeping a whisky ranch, or for illicit traffic in supplies stolen from Indian reservations by dishonest employés.

At the Yankton reservation we were much pleased with the interest manifested in the church and in the school, which is attended by adults as well as by the young. A Christian lady, trained in teaching and in nursing, accompanied me from Philadelphia to strengthen the mission to the Yankton Indians, and another member of the same Protestant sisterhood will soon join her. With an adequate number of such faithful women, thoroughly trained to illustrate to the heathen the power of Christianity by teaching and by ministering to their bodily ailments, our holy religion will soon displace the superstitious rites that are fast losing their influence over the heathen people. One of the chiefs asked that his son might live at the mission-house to prepare for a still higher calling than that of his father. The lad evinces much earnestness and indomitable perseverance in mastering his lessons; taking his books away with him and asking questions from all who can throw any light on the new language that he is determined to acquire. Several of the head soldiers, as the chief warriors are termed, are docile pupils, and in passing through the school one of them showed me his copy-book in which he had just written "Walking Elk," his English name. This head soldier and four others asked the privilege of accompanying us four days' journey up the Missouri, to prepare the way for our mission by assuring their brethren that we were bearers of good tidings from their beneficent Grand Father, the President, and that we were also the Christian helpers who had so largely benefited the Santees, and who were conferring like benefits upon the Yanktons.

At the rude ranch where, at the close of along day's journey, we stopped to pass the night, these men conferred with us on the details of our plans. They were thus enabled to impart to other Indians higher confidence in our Chief Ruler and in ourselves than if told only by the lips of a white man. This voluntary service, undertaken by men who, owing to personal bravery, are the chief leaders of their people, seemed like a providential preparation for our mission; but the following occurrence appeared to us to bear a still stronger mark of Divine interposition in our favor. Wabasha, the wise Christian head chief of the Santees, had invited Spotted Tail and Swift Bear, the Upper Brulé chiefs, to visit his tribe and to be his guests. Swift Bear, who is still mourning deeply for the death of his son, could not leave home; but Spotted Tail accepted the invitation, taking with him eleven warriors and the wives of two of them. They had left many of their illy-clad people in tattered tepees made of the thin muslin sheeting fraudulently sent them in former years, their little ones so poorly clad as to make them victims to the winter's cold. They also left their young men either chafing under the restraints from hunting the buffalo and other game, imposed upon them by the Government, or becoming slothful and vicious by being fed without any incentive to work. On the Santee reservation they did not see one tepee, every Indian being comfortable in a house built of cottonwood logs, with a stone chimney, or a cooking stove that requires only one-third the fuel needed in a tent. The children were comfortably clad; many of them attending Sunday and week-day schools, and growing up intelligent and thrifty. The young and old men, well dressed in civilized clothing, many of them owning wagons as well as horses, were contented, industrious, and hopeful. They did not see one person under the influence of whisky; neither did they hear any complaints on the part of the chiefs that their people were addicted to drunk-

enness, gambling, or other vices. No United States soldiers were near them, and a small number of Santee policemen were able to keep perfect order on the reservation. These Brulés and Ogallallas drank in all this and more, without manifesting any surprise, or uttering a word until they met the Episcopal missionary with the chiefs and headmen, at a leave-taking conference. They knew that the Santees were formerly quite as blood-thirsty and thriftless, as fond of whisky and paint and feathers, as themselves, and that they had suffered still more from want of faith by the Government. Wabasha and the other chiefs and headmen assured their delighted visitors that, under the Great Spirit, they owed their present elevation and future prospects to the Christian ministers and teachers and the sympathizing friends who had shown the Santee the better way of life. In confirmation of all this, they saw school-houses and two churches built by Christian people and supported by them, without calling upon the Government to appropriate any of the Indians' money. These men also saw the place where a beautiful Episcopal church, mission house, and hospital had been crushed and swept away by a whirlwind five months before. Near the same spot they saw, almost completed, a pile of still more appropriate and commodious buildings, the voluntary offerings of sympathizing Christian people. As the Santees are receiving less aid from the Government than the hostile Indians, these visitors were the better enabled to realize the truth of what had been told them.

They then spent several days with the Yanktons, seeing there the beginnings of the same good work that they had witnessed at the Santee agency. Some of the Yanktons, as they saw, had adopted the dress and habits of civilized life, building houses, purchasing wagons, and tilling the ground successfully. Two of the Yankton chiefs, with their adherents, had cut and hauled logs, and had performed the rougher work in erecting a building at each extremity of the reservation for a school-house and chapel. You can hardly understand the value of such a visit to us and to the cause, the more especially because of the presence of the eleven braves, who in some important respects have an inflence beyond that of hereditary chiefs. It is well known that Spotted Tail made a solemn and binding pledge to a much-beloved daughter, when she was dying, that he would never again fight the white man, but that he would ever be his ally. His great difficulty is in retaining the confidence of the young warriors when they are, or consider themselves, unduly restrained or unfairly dealt with by the Government. The non-fulfillment of treaty stipulations and promises made by authorized Government agents has placed Spotted Tail and other friendly chiefs in an unenviable position. Standing Elk, a Brulé chief, whose friendship to the whites was certified to by General Sully, by the president of the peace commission, and by others, handed his papers to me, with the ironical request that I would give them back to the men who wrote them, as he had carried them long, but found them to contain only hollow promises. I was compelled to take the papers, but we endeavored with some success to inspire this man and other Indians with the hope that President Grant would be a man of deeds as well as of words.

Marpeya Najin, (Standing Cloud,) an hereditary chief of another tribe, handed me a large silver medal that had been worn by himself, by Hitika, his father, and by Shawala, his grandfather, to whom it was given by President Jefferson in the year 1801. Standing Cloud desired me to present it to President Grant, in exchange for a medal bearing his likeness. The Jefferson medal bears on the one side the likeness of the then President, and on the other side a pipe and tomahawk, with men's hands clasped together, the motto being "Peace and Friendship." The Indians seem to have some glimmering of hope that, with the help of the church, their present chief ruler will be able to fulfill this long-delayed promise. Before leaving the Yankton reservation John Ree, a nephew of the great chief, and a leader in civilization, handed me a medal struck off at Lancaster in the year 1805, bearing on one side a representation of General Washington, and on the other an Indian, with the motto, "The land was ours." He desired a medal of President Grant, and also asked for an American flag to place on the house that he has just built, when he convenes the band of young men, who, with him, have adopted the dress of the white man, and stand pledged to promote Christian civilization among their people. He wants his fellow-pioneers in this work to discuss and, if need be, fight under the folds of the stars and stripes.

From the Yankton reservation we determined to proceed at once to Cheyenne, the extreme point of our mission, as at this season snow storms often sweep with fearful violence across the high prairie bluffs over which we were obliged to travel, and places of shelter are only to be found at distances varying from twenty to forty miles. There being no suitable conveyances for hire, I applied, under an order from the Secretary of War, to Lieutenant Colonel E. S. Otis, the commander of Fort Randall, for transportation. That brave soldier and courteous gentleman not only provided us with an ambulance, but also entertained us hospitably, furnishing us supplies for our journey out of his private store. He offered us a military escort, such as accompany the paymasters who pass over that route. We declined it, having a belief in the extraordinary intuition of the Indian, by which he so quickly distinguishes the friend from the foe; and, although we were without weapons of defense of any kind, we had by night and by

day, during the entire trip, as high a sense of security as we ever have in the most civilized portions of our country.

After four days' journey we reached Fort Sully, where Colonel Stanly, that distinguished soldier and intelligent gentleman, insisted on our being his guests. The deep interest of Colonel Stanly and of Lieutenant Colonel Otis in the Indians, and in their early civilization, if placed under favorable circumstances, confirms the opinion that I have often expressed, that many of the officers of the Army, who are the most intelligent in Indian affairs, are among the best friends of the red man. A subsequent interview with General Augur, at Omaha, served still more completely to refute the slanders that are too often heaped upon Army officers, terming them Indian exterminators. The Indians located near Fort Sully not only respect Colonel Stanly, its commander, but they look to him as to a father and sympathizing friend. We saw at his house "The Fisherman," an Indian of the Two Kettle band of Sioux, who is an industrious wood-chopper, to whom the colonel had often made small advances of money when business was dull; in every case the money was repaid to the last farthing. We were moved by a description of the sympathy and tearful grief of this Indian when death entered the family of his friend and benefactor.

Cheyenne.—Colonel Stanley and Major Whistler accompanied us to this reservation, also promising their valuable assistance to the new agent. The location of the Cheyenne agency is very bad, and another site should be selected immediately, as the Missouri River is fast washing away the ground on which the buildings stand.

Many of the chiefs and principal men of the Sans Arcs, the Two Kettles, the Minneconjous, and the Unkpapas, Sioux Indians, after an elaborate preparation with paint and gewgaws, met us in a council room that was ornamented with Indian scalps. Our Yankton Sioux, who were present as spectators merely, had, fortunately for our mission, prepared the way for us by a private interview with the leading men of these tribes. Being the representatives of the church as well as of the Government, we here, as often elsewhere, invoked the blessings of God on our deliberations in a brief prayer, that was translated by the interpreter. In introducing the new father, as they term their agent, we told the Indians that he had been sent by the church in answer to prayer, and, therefore, that the Great Spirit would help him to be a good and kind father to them as long as they were obedient and industrious. They were told that the new agent came without defensive weapons of any kind, trusting himself entirely to the Indians as his children. They were, however, made to understand that if any of them behaved badly to him, the soldiers on the reservation or at Fort Sully would punish them still more severely, because the wrong would be entirely unprovoked.

These Indians, and all others with whom we conferred, were made to understand that their Grand Father at Washington had a red man's heart; therefore he feels for them, and will drive away from the reservation all who have been wronging their daughters or depriving them of the full benefits of appropriations made them by Congress. We assured them that other members of the great Sioux nation had been lifted above the temptations to gambling, idleness, and drinking, to which the wild Indian is so prone; and that such were fast preparing to claim the rights of citizenship, now accorded to the red man as fully as to the white. We told these Indians that it is the special wish of their Grand Father and of the members of Congress who vote all the money that comes to them, that Indians who work by caring for cattle, by chopping wood, by tilling the ground, or by mechanical pursuits, should be fully fed, and have coffee and sugar, whilst the lazy and dissolute should be barely kept from starving. These Indians had specially desired that the council should be held outside the stockade, in a large room surrounded by windows, that their wives and daughters might hear the good tidings that Christian men were bringing them from their Grand Father at Washington.

With such surroundings, we took especial pains to make these Indians understand that good white men protect the virtue of wife and daughter as fully as they do their own life, and that the Indian can never rise to a high position until he acts in this respect like good white men. They were assured that the new agent, their father, would help them in this and all other things by which their position could be improved, and that he would compel all employés on the reservation to teach the Indian and to aid him in every effort to become industrious and self-supporting. They were told that they should have schools for their children if they desired them, and, if they wished it, a minister would be sent as soon as such could be procured, but that much time would be required for him to learn their language.

The chief, Long Mandan, gorgeously appareled, was the first speaker in reply. He reverently proffered his lighted pipe to the Great Spirit, then presented it to us, and afterward smoked it himself, saying that he wanted all to be bound by the same sacred influence to speak words of truth only. He and the other chiefs and head soldiers who followed him spoke in good temper, and manifested gratitude that their Grand Father's heart had at length been turned toward them; that he had sent a man to them who could go back and speak in Washington to the ear of their Great Father, and that even the agent, their father, could now write to Washington instead of to the

governor of the Territory, as hitherto. They cordially agreed to all that had been said to them, complaining, however, that soldiers had been sent to live on their reservation when Fort Sully was so near; that the right of petition had been virtually denied them, their words never reaching the ear of their Great Father, and that several items in their treaty stipulations had never been fulfilled. The promise made by the peace commissioners, that loyal Indians should have such guns and ammunition as would enable them to hunt the deer, antelope, &c., if they would abandon their distant buffalo hunts and their nomadic life and settle upon designated reservations, has not yet been fulfilled. The wild and hostile Indians get arms and ammunition from traders in exchange for their furs, while many of the best friends of the whites are degenerating into bands of loafers. The wild Indians, perceiving the advantages that they have over their tamer brethren, only come into the reservation for a short time when they are pinched with hunger. The following letter from Colonel Stanley embodies the sentiments of all the military officers on the frontier with whom I conversed:

FORT SULLY, D. T., *November* 19, 1870.

DEAR SIR: You having done me the honor to ask my opinion as to the advisability of issuing or selling hunting guns and ammunition in limited quantities to the Sioux Indians, I reply that I would issue them, or permit the Indians to trade for them under restrictions, without hesitation. If the Indians intend mischief, they will do all with the bow and arrow they would with the gun. The withholding ammunition is exasperating to the Indian and alienates our best friends; and through the contraband traders of the British possessions, of Montana, and of the Platte, the really hostile and mischievous Sioux get any amount of ammunition, and laugh at the friendly Indians, telling them, "This is your white friend; he is afraid to trust you with a load of powder."

It is asking too much of an Indian to tell him he must pitch his "tepee" close to the agency, and settle down to do nothing but eat. The Indian's mind, as the white man's, seeks some employment; as yet we have given him none; we have not given him stock; we have not started farming, and hunting is the natural outlet to the activity and the restlessness of the Indian. I know that even the old men look upon the fall hunt as being quite as essential to their health as do our city-tired people a trip to the sea-shore.

Until the present year ammunition has been a part of the annuities, and I have never seen or known any harm to come of it.

The other day The Grass, an excellent man, chief of the Blackfeet Sioux, came from Grand River to see me. He said, "My friend, as I came down I saw hundreds of antelopes on the hills. I could only look at them. I had nothing to shoot one for my dinner. I am fifty-two years of age, and have lived near the whites and been their friend all my life. I have seventy lodges, all friendly. What have I done, my friend, that the Great Father treats me so?" I had nothing to say; but when he went back he had ammunition. Of course ammunition should be sold under restrictions, the trader making a return every Saturday to the agent or commanding officer of the fixed allowance sold only to heads of families during the week. Such has been the plan heretofore, and it seems to have worked well. If guns (trade rifles and shotguns) were issued to Indians whom we know, and a promise required of the Indian that he would not trade off or part with his gun, he would keep his promise, so that we could keep the guns in the hands of our friends. Finally, we cannot expect the Sioux to believe in us unless we show some confidence in them.

I am, very respectfully, your obedient servant,

D. S. STANLEY,
Colonel Twenty-second Infantry.

Mr. WILLIAM WELSH, *Philadelphia, Pa.*

Yanktonnais and Lower Brulé agency.—The agent for these tribes of Indians has thus far resided at Crow Creek, on the east bank of the Missouri, where the Yanktonnais, or at least a comparatively small band of these friendly Indians, reside. Our conference with them was satisfactory but sad, owing to the recent death of Bone Necklace, their principal chief. These Indians long for a minister, for schools, and for instruction in agricultural handicraft, with such appliances as will enable their people to draw support from the soil instead of being fed like tame cattle. They have long resided on the east bank of the Missouri, but it is very doubtful whether they can ever draw sufficient support from that region of drought. The women here have been more demoralized than elsewhere by the immoral conduct of those whom the Government has placed over them. The Indian's idea of the married relation gives the designing white man much power for evil. At our council with the Yanktonnais we were much touched with the tone of sadness that pervaded all who were present, but especially the brother and the two sons of their late principal chief, whose new-made grave we had seen marked on the hill-top by a little white flag. His sons said in council that their father

had heard that Christians were coming to bring relief to his people, and he had longed to live that he might take them by the hand and welcome them. It cheered us to learn that the tidings of our coming had comforted the dying man, by giving him hope as to the future of his people. We clambered up to his resting place just as a cloud cast its dark shadow upon the grave, but all beyond the grave was made bright by the light of the sun. The wife of the chief had been buried beside him, she having died a few days after him, as is said, of a broken heart. On one side of the grave the ground was covered with blood, and there lay the stone on which his children sharpened their knives to puncture their arms and legs, that a suffering body may sympathize the more fully with a troubled spirit.

The Lower Brulé sub-agency is on the west bank of the Missouri River, about nine miles below Crow Creek. Ferrying here is very tedious, owing to sand-bars, and yet from defective arrangements all the meat, and in some years all the other stores, have to be taken across this miserable river. The agency should be on the west bank of the river, as the Indians are far more numerous there, and it is most important that the large roving bands of wild Indians should be brought under some control. The Lower Brulés are so called because they have for a long time frequented the banks of the Missouri, while the Upper Brulés have usually ranged toward the sources of the streams that empty into that river.

At our first conference with the Lower Brulés, speeches were made by their four chiefs, Iron Nation, Medicine Bull, The Man who Killed the White Buffalo Cow, and Little Pheasant. These Indians seem earnestly anxious for Christian civilization, begging for teachers and missionaries. Iron Nation, the first speaker, said that they had tidings of our coming, and it seemed to them that at last a great light was about to shine on the pathway of his people, who had so long groped on in darkness. He prophesied that bad white men will oblige his people again to pass through deep waters, yet they would not be hopeless, now that Christian people had offered to be their friends. They complained, very properly, that their father the agent resided on the other side of the river and rarely came to see them. They thought that their Grand Father in Washington could not know where the Lower Brulés were, or he would give them an agent to reside among them, that he might aid in bringing their wild and hostile brethren into more peaceful relations with the Government. The hostile Indians were in a camp about forty miles out, and they look upon those on the reservation somewhat as we do upon wild animals who have been entrapped, caged, and fed.

The oxen were slaughtered by them on the opposite bank of the river the day we arrived there. The power of the bow, when in the hands of an Indian, was shown by completely burying the arrow in the body of the ox. This mode of killing the animal, or shooting him with a rifle-ball, is adopted to prevent the loss of blood. The chiefs of the Lower Brulés asked that beef might be issued to them oftener than once a week, as, in their idle life, Indians eat voraciously after three days of fasting, and thus consume all their rations of beef by the fourth day after its issue. We persuaded the new agent, instead of slaughtering the cattle on the opposite bank of the river, to give them a month's supply of live cattle, taking their pledge that they would only kill a ratable proportion on each alternate day. Unless we doom this people to destruction, we must make them provident instead of continuing to promote improvidence among them, and to destroy all self-respect. As long as the wild Indians see that those residing near the agencies are degenerating, we can hardly expect them to come in. Some of the wild Lower Brulés are lawless free-booters, stealing horses and mules from the neighboring tribes and from the Government. Capturing these men is well nigh an impossibility, for the Government has no mounted soldiers on the Missouri River. As soon as the peaceable Indians can illustrate to them the advantages of civilization, most of their brethren will be glad to come in, as game is getting scarce; and the few lawless spirits can then be readily restrained by their own people. The Lower Brulés, having long been near the Missouri River, prefer to remain there, although the soil is better and there is more rain in the upper portions of the reservation near the Black Hills. These Indians complained that a company of soldiers had been located at their sub-agency, although, as they alleged, they have always been peaceable. Wood in that country is very scarce; yet these troops have, without conferring with or compensating these Indians, cut large quantities of wood for houses and for fuel, and have thus far excluded the Indian from the use of the saw-mill that was theirs by treaty stipulation. Many excellent practical suggestions were made at the conference with these Indians, and the new agent, who was present, will undoubtedly adopt them so far as they are likely to be beneficial. Indian diplomacy is quite amusing to the uninitiated, but is likely to mislead those who are not familiar with their habits. The conferences with the Lower Brulés were held in the house of the sub-agent, who they supposed would be retained in office. Although in his presence they commended him to our favor, yet at a private interview after nightfall, one of them revealed his true character, which corresponded precisely with the estimate our new agent had formed of the man. These Brulés have so seldom been brought into contact with the white man, that their women are remarkably virtuous. We

passed part of the evening in the capacious tepee of one of their chiefs, conferring with him as to the condition and prospects of his tribe. It was truly comfortable, being made of dressed buffalo-skins, and, when contrasted with their muslin tents, we could readily understand why the Indian complained so bitterly of being restrained from buffalo hunting. Many o f the Indians who have been brought into the reservations were promised comfortable log houses, as they could not renew their buffalo tepees, but that promise, like many others, has not been fulfilled. The temporary barracks built here by the soldiers will, I hope, be vacated in the spring and given to the Indians in partial fulfillment of this promise. The site of suitable agency buildings on the west bank of the Missouri ought to be soon determined on, and the supplies for the coming season deposited in them.

Whetstone agency.—Here we first conferred with the influential white men, who were legally incorporated with the Upper Brulés and Ogallallas before they left their distant homes to come to this reservation at the earnest solicitation of the peace commissioners. All of them have log houses, and some already possess quite creditable farms. These white men have Indian families, and, whilst despondent as to the future of their people, they were less abstemious than they should have been. Their influence for good or evil upon the tribes with which they are connected is so great that we took much pains to make them hopeful. After a conference with their intelligent-looking children, we pleased the little ones, their mothers and fathers, much by making immediate arrangements with the zealous wife of the new agent for the early opening of a church-school. The treaty promises a teacher for every thirty children, but thus far these wards of the nation have been allowed to grow up in utter ignorance. We cannot say of the Upper Brulés what we did of the Lower, for there are many Indian women with half-breed children, in poverty and ignorance, because deserted by their fathers many of whom are men of respectability in their dealings with white people. The Church has hitherto neglected this people, grown degenerate because brought in contact with a so-called civilization which, not being restrained by Christianity, sinks in many things far below the most superstitious heathenism.

We also conferred with such chiefs and other Indians as had not gone into winter quarters up the White River. Several of these had cultivated the soil, but were disheartened because of the drought and the failure to fulfill the encouraging promises made to them. One of these men had broken twenty acres of prairie sod—quite an achievement for an Indian. They had been promised ponies if they would engage in farming, but that promise had never been kept. Thus far I had purposely avoided feasting or giving any presents to Indians, that they might the more readily understand that our mission was one of benefit to them solely, without desiring any favor to ourselves. These pioneer workers of the soil changed my course, and, although without authority, I promised that the agent would furnish a pony each to twenty of the most deserving among them. The cost will be from six to eight hundred dollars, and, unless authority is given by the Government, the draft will be made upon me. The agent writes thus to me: "The promise of ponies to those Indians who have been farming is a step in the right direction. They have promised me that they will stop drinking whisky, and will try and prevail upon their people to do likewise."

We exerted ourselves to the utmost to prevent the nefarious traffic in whisky, which was fast demoralizing this idle and hopeless people. President Grant promptly remanded back to Fort Randall a military reservation that, having been relinquished some years since, had become the abiding-place of five or six notorious and lawless venders of whisky. The War Department sent orders to Lieutenant Colonel Otis, of Fort Randall, to take immediate possession of the reservation and to send off all injurious persons. This will be done effectually, as the colonel is a fearless and faithful soldier, and he is fully aware what a den of iniquity is on that reservation. He said that if Indians had killed as many white men as have been murdered there in drunken brawls, the whole country would have been up in arms against them. If this important act of the President is followed up by the temporary withdrawal from sale of all lands on the eastern bank of the Missouri above the military reservation, the whisky traffic can be stopped and the soldiers removed, except from Forts Randall and Sully, and other important points higher up the Missouri. By occupying the few ranches necessary for the accommodation of travelers with a few trusty soldiers or other reliable persons, the whisky and all illicit traffic can be broken up, and the soldiers withdrawn in the spring from Whetstone, Crow Creek, the Lower Brulés, and Cheyenne, where they are kept at a cost of over $300,000 a year.

Opposite the Whetstone agency, the shrewd proprietor of the only ferry and of a whisky ranch had preëmpted 190 acres of land in fractional sections, giving him a mile and a half of river front. As this man could not be legally removed, and as his presence there was working ruin to the reservation, I purchased his buildings, boats, ferry, and land privileges for $1,200. The Government paid him annually a considerable sum for the use of his ferry-boats. There is an evident propriety in having the control of the ferry; but if the Interior Department does not approve of the purchase

I may dispose of it to some trader; or I will be quite willing to bear the expense for the good that I know will be accomplished by the purchase.

Before we reached Whetstone, most of the Indians had gone between eighty and ninety miles into winter quarters, on the White River; the returning teamsters report that there is there plenty of timber and grazing for stock. After Spotted Tail's return from his visit to the Yankton and Santee Indians, being most anxious to confer with us, he tarried several days, expecting that we would come direct to Whetstone. Not having been apprised of his intention to go out so far for winter quarters, we had gone to Cheyenne, the farthest point, first. He dictated the following letter to me, and asked the new agent to inform me that the letter contained the substance of what he desired to say:

WHETSTONE, D. T., *November* 15, 1870.

MY FRIEND: I wish you to send us a missionary, as I find out it will be for the good of my people, and my white relations have recommended it. We wish only to winter here on the White River. We wish to remove as early in the spring as possible to our farming reservation on the White River, near the mouth of the White Earth. We wish our white relations and our half-breeds to accompany us. It is a country abounding in timber, and the soil is good. We wish our goods and rations sent to Fort Laramie, and then would like you to pay our half-breeds and white relations what you think reasonable for freighting for us. In this way we will earn money, and learn to work, and can keep bad white men off our reserve. We wish our own people to do all the labor on our reserve, except such as they do not yet know how to perform. I wish you would continue inviting each year four headmen from our tribe, and also from that of Red Cloud. to visit Washington. We think the President is right in thinking this a good way to benefit and teach the Indians, and make them peaceable, and good friends of the whites. When we are on the White River we wish you would let our people, or part of them, go on a buffalo hunt to the Republican River.

I have three villages—one of Ogallalla, say 200 lodges; Black Bear is their chief; the Brulé Wanagi, (ghost,) 150 lodges; Red Leaf is their chief; the Upper Brulé, 225 lodges; Spotted Tail is their chief. We wish to have some of our own people to instruct each band, and also an interpreter for each. We would like to have our friend Raymond for farmer, and our friend Bissinett for interpreter. We would like to have some guns and ammunition, as it would aid us in getting skins for our moccasins, and also for our lodges. We live in a country abounding in elk and deer. We wish to have free trade among ourselves, and to have no outsiders allowed to trade among our people. Claims have accumulated against us between the years 1849 and 1857. We do not wish them paid out of our moneys. We would like large garrisons of soldiers kept at Laramie, and also on the Missouri River, to keep off bad whites and whisky from our reserve. To us whisky is death.

Your friend,

LINTE-GLESCA, (translated Spotted Tail,)
Per BISSINETT.

To Mr. WILLIAM WELSH.

The requests in this letter have been considered as follows:

First. A missionary and teacher will be sent soon after the location of these Indians has been determined on.

Second. The removal to the sources of the White River was authorized by Secretary Cox.

Third. If the white Indians and half-breeds go, Whetstone agency can be abandoned; and the present agent, who is favorably known to Spotted Tail and his people, will move out to the new agency. In the interim, the agent, with our cordial concurrence, has employed Tod Randall, one of Spotted Tail's white relatives, as he calls him, to act as sub-agent.

Fourth. As the country abounds in grazing land, it will be important, at an early period, to bring young cattle from Texas, and to use the Indians as herdsmen, until they can be taught to raise stock for themselves. Cattle, after one winter on the White River, can endure the cold of the Upper Missouri, without the loss of health or of flesh that is certain to ensue when driven directly to the existing agencies.

Fifth. I went to Omaha to ascertain the relative cost of sending freight via Cheyenne and Fort Laramie, or by Whetstone and up the White River. The mode indicated by Spotted Tail will be the cheapest and best. The officers of the Pacific Railroad, with whom I conferred, manifested a willingness to make concessions for Indians so long as they continued their friendly relations.

Sixth. It is the intention of the agent to employ the members of the tribe to do all the work that they are willing to perform, and to insist that *every* employé shall instruct the Indian.

Seventh. Spotted Tail's suggestion that the President should continue to invite four headmen from his tribe, and four from Red Cloud's, to visit Washington yearly, was

made by nearly, if not all, the other tribes, and approved of by the most intelligent friends of the Indian. The most practical suggestion is that four representative men, who have never been to Washington, be selected from each important tribe and taken together to Washington for a brief conference with the President; then to some machine shops, like the Baldwin locomotive works in Philadelphia, where 1,900 working men can be marshaled before them, and afterward to visit the Cherokee Indians or others who have progressed in civilization. This can be accomplished with little trouble and expense, if it is arranged by the Rev. Messrs. Williamson and Hinman, the missionaries of the Presbyterian and Episcopal churches, who have great influence with the Indians of the Sioux Nation. The importance of this suggestion cannot be over-estimated if the leading braves are selected instead of chiefs, many of whom have lost their influence over their tribes.

Eighth. The suggestion about guns and ammunition has already been referred to. Those of us who live in comfortable houses, and have our feet well protected, can hardly realize the importance to the Indians of skin for lodges and moccasins to protect their feet.

Ninth. Spotted Tail is right in claiming the help of garrisons in keeping off bad whites and whisky, for he has time and again been compelled to task all his powers to the utmost to prevent quarrels, begun in a drunken row, from inflaming the whole Indian nation. When he closed his letter by saying, "To us whisky is death," he doubtless remembered the day when he killed Big Mouth, the chief of the Ogallallas, who, in a drunken broil, had dogged him all day and then attempted his life.

Poncas.—When we reached their reservation, the new agent, with whom we had previously conferred, had already dismissed all white employés, except the engineer, using the Indians and half-breeds who were working well. These Indians in council evinced much practical common sense. They see that civilization is their only hope. They were delighted to learn that the church would furnish teachers without diminishing their small annuity; and they think it hard that they are never consulted about the expenditure of their money, and that no account is rendered to them of the way in which it is used. They complain that six hundred dollars of their money is taken for a physician, who comes in frequently, and whose services they never desired. With such Indians, surely there should be some conference if there is to be any effort made toward their civilization. In my report to the late Secretary of the Interior, I stated, that owing to the entire failure of their crops, the Poncas would be in a starving condition before the end of October. They were sorely tried by seeing thousands of oxen and steamboat loads of provisions pass by their reservation to feed the Sioux Indians who had been so hostile toward the white people. As the Commissioner of Indian Affairs did not feel warranted in using any money for the Poncas, except their very small annuity, I undertook to feed them with the most rigid economy. The flour furnished by the contractors cost at the reservation five cents a pound, and beef, when dressed, thirteen cents a pound. I purchased wheat at one cent a pound, with three-quarters of a cent a pound for land carriage, and had it cracked for boiling, or ground at the mill on the reservation without any additional expense. This, with pressed lard, which I bought in Chicago at sixteen cents a pound, and suet, purchased in Sioux City at twelve cents a pound, will keep this tribe in health and working condition at about one-fourth the cost of maintaining the other Indians. They ought, like other Indians, to have sugar and coffee: but I desired first to test their willingness to economize to the utmost, for it seemed wrong to stop their small money annuity, which they absolutely need to purchase cooking-stoves and other appliances of civilization not furnished by the Government. They behaved so well under the very trying circumstances in which they are placed, that I told the agent to pledge them this month a money annuity of $5 a head, say $3,750. I felt sure the Government would not withhold it, but I would not have promised it had I not been willing to make the payment in case of disappointment. A visitor must have a heart much harder than mine, to refuse a helping hand to Indians who are intelligently striving after Christian civilization, and who, in their new-born hopefulness, have already acquired sufficient strength to resist the natural temptation to strong drink. Their chiefs voluntarily confessed, to their shame, that some of their people had, since I was there in September, been induced to make reprisals of horses. They promised to use all their efforts to prevent it in future, although I must confess that human nature alone will not enable them to do it. The Government stands pledged by treaty to protect them on their reservation, and yet time and again the roving bands of Brulé Indians have stolen their horses, and they have not been replaced by the Government. When the nation does justly by its wards, these predatory excursions by Sioux, by Pawnees, and by Poncas, can no doubt be checked if proper means are used. The night after I left the Poncas, they seemed so defenseless and were in such dread of a band of Brulés that were skulking about, that the agent gave them all the ammunition that he had. The United States soldiers on the Missouri, not being mounted, are useless for any other purpose than that of defending a post.

If Indians are clustered around a fort or stockade, the demoralizing influence of sol-

diers upon them far overbalances all the advantages that unmounted men can afford in protecting property. The cattle range far beyond the reach of the soldiers, and in some instances there is but one white herder, all of his assistants being Indians, showing that they could be easily trained to protect their own property. The cost of a single company of soldiers at one of these stockades varies from $75,000 to $100,000 every year, and I became satisfied, from inquiry and observation, that well-appointed Indian soldiers, mounted on their own horses, can be trained to protect all the property at less than one-fourth of the present cost. Not being willing to trust my own judgment in this important subject, I asked a thoroughly competent and experienced officer to give me his views. As he is not the commander of a post, I do not give his name, but append his letter:

DAKOTA TERRITORY, *November* 21, 1870.

MY DEAR SIR: In accordance with your wishes that I should give you an account of my knowledge of the kind of soldiers which Indians make, &c., it affords me great pleasure to comply with your request.

Section 6 of the act of Congress approved July 28, 1866, grants authority for the employment of Indians in the Territories and Indian country to the number of one thousand, who shall receive the pay and allowance of cavalry soldiers.

In the spring of 1869 I saw a detachment of Indian soldiers at one of the military posts in the northeastern part of this Territory. They were commanded by a commissioned officer, and were also clothed and equipped in every particular like the soldiers of infantry, living in common tents, which were regularly pitched. I saw them at a general inspection. They had on the full uniform; the brasses on their hat and the scales were well cleaned and polished; their arms and accouterments were in the best possible condition; their clothing was neat and clean, and in every way they bore a presentable appearance.

These Indians belonged to the Sisseton and Wahpeton tribes of the Sioux, and, only a few months before I saw them, were roving over the prairies in the Indian garb and living in a tepee; but in a short time their mode of life was changed; they were contented and glad to wear the clothing furnished to the troops, and were proud of the full uniform, and readily abandoned the tepee for the tent used by the American soldier.

The officer in command told me that the non-commissioned officers and soldiers made excellent scouts and guards, and were always found to be reliable.

I made a trip through the northern part of the Territory last spring, and I noticed that the military had established mail stations at various points between Fort Totten, at Devil's Lake, and Fort Abercrombie, on the Red River of the North. At each one they had a small squad of Indian soldiers in charge of a non-commissioned officer, (Indian.) From my observation and by inquiry I found that they were efficient, prompt, and reliable in the execution of their duties and they had the full confidence of the officers. They were paid and placed on the same footing with soldiers, having been duly enlisted for a certain period.

I am confident that at any place in this Territory Indians may be found who can be organized into bodies, paid, clothed, and equipped, and be made excellent soldiers for guards, &c. I believe they can be made good herders, and in that capacity successfully used, and that they will make a good and effectual police.

I know by experience that the Indians in this Territory make excellent, reliable, and useful scouts to detachments of troops or parties traveling on the prairies.

Sincerely and respectfully yours,

——— ———.

WILLIAM WELSH, Esq., *Philadelphia, Pa.*

Our mission was brought to an appropriate close by spending Thanksgiving day on the Santee reservation. At their morning worship this people seemed to realize that there was special cause for thanksgiving among the Indians. Citizenship had been placed within their reach, and the President has resolved to strangle the political vampire that has hitherto sucked out much of the life-blood of the Indian. They rejoiced to hear that their less civilized brethren were longing for Christian teachers. When they sang from the missionary hymn,

> "Shall we, whose souls are lighted with wisdom from on high,
> Shall we to men benighted the lamp of life deny?"

I felt rebuked for want of zeal, as some of the very men who were present had preceded me in a missionary excursion up the Missouri River, and in some places they had borne the very first tidings of Christianity. Two otter skins, garnished with bells, that had long been used in the sacred medicine dance, were presented to me as the last relics of heathenism in this tribe.

In the evening their wise men called to confer with me, and their words were so sensible and reasonable that it seemed impossible to realize that I was in the presence of men who, ten years before, were superstitious heathen. They unanimously asked to

have their reservation placed under the care of the Episcopal Church, that the whole Sioux Nation might be bound together in one brotherhood. The Santees pleaded for this great favor from their Grand Father with the utmost earnestness, and then drew from me my pledge that I would present their plea. Last October they had a convocation composed of Yanktons and Santees, with one representative from the Poncas. The beneficial results far exceeded the expectations of the Reverend Mr. Hinman, its projector. It is now proposed to have an annual or semi-annual convocation, composed of the missionaries and teachers of the Episcopal Church, the agents nominated by it, and three or more delegates from each tribe of Indians under its charge. Such a meeting would be productive of much benefit, and will serve to stimulate the wild Indian to more strenuous efforts after civilization.

The failure to keep treaty stipulations had so exasperated the Indians a year since that Major Hearn, at Grand River, and Major Randall, at the Cheyenne Reservation, were in constant peril of their lives. These officers were so brave and discreet that they deserve an honorable place in the reorganized Army. Colonel Stanley, who watched over these military agents, commended them strongly to me. A few loyal Indians stood by them. When the wild and exasperated Indians were in the habit of menacing Major Randall, even after he had retired to rest, Frozen Foot slept by his bed, and Little Bull and Crow Feather also united in his defense. With a single exception, all the military agents did as well as could be expected under the trying circumstances in which they were placed. They had no previous preparation for such a work; they did not desire it; going to it merely because they were ordered to this unusual duty, and realizing that at any time they might be called to the military service, for which they were commissioned. There was one disorganizing influence beyond their control that disheartened some of them and irritated others. They were placed under a political governor, who was *ex officio* superintendent of Indian affairs, and he, no doubt, also was subject to like political influences. Incompetent and dissolute subordinate assistants were sent to the agencies without the consent and sometimes against the remonstrance of the agent, who should have been supreme. Salaries were paid to some of these subordinates higher than those paid to the principals who had all the responsibilities, and should have had entire management of the agencies.

Remonstrances were either not forwarded to Washington by the superintendent, or were not heeded there, because the Indian Office had not then been emancipated from political thraldom. Some of these employés acted dishonorably, and others dishonestly. In one case, during the temporary absence of the agent, one of them certified to the receipt of a larger number of cattle than the agent could find upon his return, and gave a voucher that the average weight was 1,200 pounds, when, after two weeks' good feeding, the average weight proved to be but 963 pounds. Steam-engines were sent at a large cost that were, in some instances, too small and too light to do the heavy sawing for which they were designed. These disorganizing influences, had they not been checked by the President, by the removal of the political superintendent, would have hindered the civilization of the Indian, and doomed him to perpetual beggary at a fearful cost to the nation.

There is one department that needs the powerful grasp of a master hand. I refer to purchases by contract and otherwise. It is estimated by men of large experience that a few adroit manipulators of contracts and purchases have made at least $250,000 this year from supplies to Indians on the Missouri River alone. All this and more could have been saved if the business had been conducted just as those of us who are merchants manage our own operations. Thus, 25,000 sacks of flour were contracted for at $3 50 for a bag of ninety-eight pounds, delivered at Sioux City, when the price at that place was $2 20, and ought to have been $2, as wheat was only worth from 60 to 70 cents per bushel. The bargain for freight up the Missouri was high, in about the same ratio—say 2¼ cents a pound to the nearest reservation, and 6¼ cents to Grand River. Wheat could have been purchased and ground on the reservation at one-third the cost of the present supplies. The 8,000 head of cattle required for feeding the Indians were furnished by certain contractors and others of the initiated, who virtually sublet their contracts at an immense profit to equally responsible Texas herders.

These herders took all the risk of delivering cattle to the agencies on the Missouri, being usually paid on the same voucher that draws the money in Washington. It is estimated that at least $200,000 to $250,000 could have been saved on this one item, exclusive of frauds in the count of cattle and in their weight. Congress has been striving for many years to prevent frauds by legislative checks and restraints, instead of by intrusting experienced and thoroughly competent men with the disbursement of money. Under existing laws bids are to be asked for and contracts made, instead of buying in open market. This system has virtually thrown the business into the hands of the initiated, who so successfully manipulate the whole affair that competition by the uninitiated is usually viewed as hopeless. By a system of straw bids, and by occasional purchases of the prospective profits of some skilled bidder, the contract system is reduced to a science that gave me some study during my last trip.

Bad as this system is, I am grieved to report an occurrence that I trust you will refer

at once to the Bureau of Indian Commissioners for thorough investigation and *public* report. The following clause will be found in an act of Congress, passed the 15th of last July, termed the Indian appropriation bill: "It shall be the duty of said Board of Indian Commissioners to supervise all expenditures of money appropriated for the benefit of Indians in the United States, and to inspect all goods purchased for said Indians in connection with the Commissioner of Indian Affairs, whose duty it shall be to consult said commission in making purchases of said goods."

These special commissioners, who serve gratuitously, were consulted as to the purchases and inspection of dry goods, but they were not consulted or even notified of the purchase or inspection of the other goods that were bought by the Commissioner of Indian Affairs on contract and by private sale to the extent of a million dollars or more. Four hundred and fifty thousand dollars of this sum was spent for Texas cattle at 6½ cents a pound on the hoof, the highly responsible Texas drovers delivering them, without any risk to the original purchaser, at 2¾ cents a pound, or thereabouts. In some instances the Indian agent refused to receive these cattle, as he already had a three months' supply; the loss by death and shrinkage during the winter, by stampeding, and by the cost of herding, being so great that the agent would not assume the risk. He was, however, compelled to receive the cattle, to the great loss of the Government, by a positive order from the Commissioner of Indian Affairs. I was credibly informed at the agencies that bribes were offered to certify to overweight.

The vouchers in the Auditor's office reveal the fact that payment was made on receipts given by subordinates while temporarily acting under the authority of an absent agent. These certificates merely indicate the pounds of live cattle, without giving the number of the cattle or stating whether they were all weighed, averaged by weighing a certain number, or certified to by a mere guess at the weight. The certificates for slaughtered beef were evidently given before the cattle were killed.

Although the agent's report of an error or fraud by his representative was received at the Indian Office, it was not sent to the Auditor. If it came after the settlement of that portion of the purchase, it should have been sent to the Auditor before the next payment. When the tidings of these transactions reached me, I hoped that it was some trifling purchase made to meet an exigency. To my surprise, I saw immense herds of Texas cattle on the way to the reservation on the Missouri River last month, paid for November 28, at 6½ cents per pound, the sum being $155,493. Cattle for immediate delivery in the spring could have been purchased in the neighborhood at 4 cents per pound, and in Nebraska, at Schuyler or Columbus, for early delivery, at 2½ to 2¾ cents. I could furnish other details equally startling, but this will suffice to enable you to provide a remedy. These facts came before me while I was aiding the President of the United States in carrying out his policy. I feel bound to communicate them, as I know that both the President and yourself have resolved to purge the Indian Department thoroughly, that appropriations by Congress for the benefit of the Indian may hereafter impart the largest benefit to this long-neglected people.

A remedial measure was attempted at the last session of Congress, authorizing the appointment of five permanent Indian inspectors, and but for the opposition of one Senator it would no doubt have become a law. If Congress will coöperate with the President this year, by appropriate legislation, enough money may be saved from the appropriations to promote every civilizing process among the Indians and to stock their farms so fully that in a few years most of their supplies can be drawn from their own farms and herdsmen. Of course this is not to the interest of the contractors, or of those who participate with them in their large gains. Some of their adherents, and others who are disappointed, have notified the Indians that the Senate will not sustain the President in his present position. You well know that he will be sustained, and that Senators, though now bound by party rules to get for their constituents a just proportion of political patronage, will rejoice that the President had manliness enough to withdraw Indian appropriations from party patronage, when, as in this case, it tends to demoralize our home heathen. I cannot speak for other religious bodies; but no missionary to the Indians, with whom I am connected, will use a dollar of Government money for the support of churches or of schools; and I sincerely hope that we will also be able to furnish the physicians and all the medicines required free of cost to the Government or the Indians. The progress of Christianity will, of necessity, be slow in converting heathen people, until, as in gospel times, teaching and healing are used to illustrate and enforce the truth of the preached gospel. I am encouraged in thus reporting at length, by remembering your earnest pleading for the Indian two years since, when we were both delegates to the convention of the Protestant Episcopal Church. Command me freely when I can further help you in this cause.

Yours, very respectfully,

WILLIAM WELSH,
1122 *Spruce Street.*

Hon. COLUMBUS DELANO,
Secretary of the Interior, Washington, D. C.

DEPARTMENT OF THE INTERIOR, OFFICE INDIAN AFFAIRS,
January 12, 1871.

SIR: During my necessary absence in the Indian Territory, whither I had gone under your orders, to attend the general council of the Indian tribes of that Territory, a letter addressed to you by the Hon. Wm. Welsh, of Philadelphia, was published in many of the daily prints, alleging "frauds in the purchase and transportation of goods for the Indian service" during the past year. I did not see this letter until my return to the States, near the close of December. I also subsequently learned that the appropriation committee of the House of Representatives had been ordered to investigate the same. I deem it, therefore, my duty, in justice to myself, to briefly reply to some of the allegations in said letter, and respectfully to request that the reply be filed in your Department.

The allegations of fraud relate principally to contracts entered into for beef and flour, and the transportation of Indian goods to points on the Missouri river, principally for the Sioux of Dakota. The charges are very general and cannot, therefore, be answered as specifically as might be desired.

To a proper and fair understaning of the action of this office in entering into contracts for beef and flour, it is necessary to explain that an arrangement existed with the commissary branch of the Army to feed Indians—the Sioux of Dakota being included—until July 1, 1870, the same to be paid for out of the appropriation of April 10, 1869, of two millions of dollars, "to enable the President to maintain the peace among and with the various tribes, bands, and parties of Indians, and to promote civilization among said Indians; bring them, where practicable, upon reservations; relieve their necessities, and encourage their efforts at self-support." The Sioux of Dakota, the southern Cheyennes and Arapahoes, and the Kiowas and Comanches, whom the peace commission of 1867 had located about agencies they had established, received most of the benefit of this arrangement. All familiar with Indian affairs will admit that these tribes of Indians are among the wildest and most warlike of the remaining Indians of the United States. The inducements held out to them to cease their warfare against the citizens of the United States and settle upon reservations, was, that they should be clothed and fed, and ultimately taught the useful arts pertaining to civilized life. A large portion of these Indians had been thus located and fed and clothed for more than eighteen months previous to July 1, 1870; and during that time a comparative peace had been maintained along the western frontier. It was known and admitted by all who had dealings with them, that it was only the food and clothing that kept them about the agencies, and it was the unceasing apprehension of all that the moment their supplies ceased they would abandon their agencies, and at once resume their nomadic habits, taking from citizens whatever property they might fancy, and inauguratng a war, if deemed to their advantage. In the month of June last but little prospect existed of passing the Indian appropriation bill before the 1st of July, at which time the arrangement with the Commissary Department was to terminate.

In May and June, 1870, Red Cloud, Spotted Tail, and other Sioux visited Washington to secure a better understanding with the authorities of the United States respecting their future. They were assured that if they staid upon their reservations and remained at peace they would be fed and clothed. The Indians then complained that they had not been either well fed or sufficiently clothed. No positive promise upon any matter presented by them was made on behalf of the Indian Office, as everything depended upon the action of Congress on the Indian appropriation bill then pending in that body.

The fact was patent to the Indian Office, and all familiar with our relations to the Indians above named, that unless something was done to continue their subsistence after the 1st of July, they would very soon thereafter abandon the agencies around which they had located, return to the plains, and again commence their predatory habits. The Indian agents then in Washington stated positively that in case of failure to continue the supplies the Indians would commence depredating, and perhaps inaugurate a general Indian war. Such a result was not to be desired. The large expenditures of money and labor which had resulted in producing a comparative peace and safety along most of the Indian frontier was not to be recklessly thrown away. The Indian Office felt that the country demanded that peace should continue to exist, and that the horrors attendant upon an Indian war should be averted. There was but one sentiment respecting Indian affairs, and that was the continuance of peace. To obtain subsistence for the Sioux alone required time. Their treaty stipulated certain supplies for them, and they demanded it in person as well as through their agents. (The treaties with the southern Cheyennes and Arapahoes, and the Kiowas and Comanches, embrace no stipulation of subsistence for them, and is a serious oversight, as without it peace cannot long be maintained.) Up to June 15, 1870, no Indian appropriations had passed, and deeming it of the utmost importance that immediate steps should be taken to keep up the Indian supplies, I looked about to find some responsible party who could furnish the necessary supplies within a limited time and take the risks

of appropriations being made to pay for the same. Among the many persons who were either recommended by friends or applied in person to do the required work, I selected Mr. Bosler. I had no particular personal knowledge of him, but he was represented to me as having at different times supplied the Army posts on the Missouri, had also had some dealings with the peace commission in the matter of furnishing supplies for them during their negotiations with the Indians, and was generally familiar with every difficulty to be overcome in contracting on the Missouri River. The manner in which he executed his contract fully justifies the confidence the office placed in him. An abundance of good provisions was soon supplied, the Indians did not abandon the agencies, and an apprehended expensive Indian war was averted. But it is alleged that the prices paid for beef and flour were too high. To this I can only say that, with the information the office then possessed, it did not seem extravagant. Preceding July 1, 1869, General Harney, acting under the sanction of the peace commission, paid for beef, 7.90 cents per pound, gross weight, for feeding these same Indians. The same commission paid six cents at Fort Laramie. I was also credibly informed that the Commissary Department were paying 5 cents for beef at Fort Randall, 5.90 at Fort Rice, and had at times paid as high as seven cents per pound at the latter place. Five cents had been paid for beef in Sioux City, and in 1869 the Commissary Department, under its arrangement with the Indian Office, was getting beef for 4.44 cents.

In 1867, the peace commission paid for flour $6 per 100 pounds; in 1868, Indian Commissioner Taylor paid $6 50 per 100 pounds, delivered at the Ponca and Yankton agencies; $9 at Crow Creek; $11 at Fort Sulley, (near which the Cheyenne agency is now located,) and $12 50 at Fort Rice, (near which is the Grand River agency.) Superintendent S. M. Janney has paid during the past summer, for use at the Santee agency, $3 35 per 100 pounds. General Harney, while in charge of these Indians, had paid 5½ cents for flour delivered in Sioux City, and 11 cents delivered at the Whetstone agency. I was also informed that the Commissary Department was paying for its flour, during the past summer, $3 35 per 100 pounds, or thereabouts. No arrangement beyond July 1, 1870, could be made with the Commissary Department for feeding the Indians. They would make no agreement until assured by an appropriation by Congress in bulk, which the result shows did not occur. Hence it was evident that there was an emergency demanding not only immediate action, but action which would not properly be subject to the rule of ordinary purchases or contracts, because the time within which a large amount of beef and flour must be delivered at points remote from the depots of supply was very short—less than a month—and a large amount of capital, some $300,000, must be risked upon the contingency of a future appropriation, an investment which would not be made at any rate by a majority of those governed by the regular rules of trade; and while other contracts and purchases in the same locality are presented as giving a scale of prices, (and this purchase is submitted without hesitation to their test,) it should be borne in mind that they were made in the main when there were funds in the hands of the parties contracting, or applicable for their payment. Such being my general information and impressions at the time, in arranging terms with Mr. Bosler, I felt confident that the bargain was not a bad one. As before stated, he promptly executed his work. No fault has ever been found by the Indians with the quality of the supplies he furnished, or that the quantity was deficient, except in the weight of beef at the Cheyenne agency, referred to in said letter. The papers show that at this time the agency scales were out of repair, that every precaution was then taken, in the manner practiced at frontier posts, to get at a correct average weight of the cattle, and experts were called in from Fort Sully to assist in the matter. There was no suspicion of fraud in the manner of arriving at the weight, and the contractor had a right to expect pay for weights thus agreed on.

Respecting the transportation, to which reference is also made as being high, and therefore conclusive of fraud, I reply that nearly all the Indian freight, consisting of annuity goods and some other supplies, reached Sioux City in October, at a time when navigation on the Upper Missouri had nearly ceased on account of low water and the near approach of cold weather, and I made the very best terms I could with the most responsible parties running boats on the upper river to insure the certain delivery of the Indian freight. The prices paid, in my judgment, were reasonable, and will compare favorably with what has been paid in former years and that paid by the Army for the fall months of the present year. It must be borne in mind that the season was late; all Indian freight was bound to be taken up to their respective destinations, or endless trouble would be the result of failure, and water transportation was cheaper than by land, though both were high.

Respecting the allegation made that Captain Poole, then agent at the Whetstone agency, refused to receive the cattle because he had an abundant supply on hand, and yet was ordered by the Commissioner of Indian Affairs to receive the cattle, I reply, that no one was more urgent than Captain Poole, while in Washington with Spotted Tail and his party, that there should be no interregnum of supplies at his agency. He repeatedly stated that he should be out of everything after July 1, and his representations had certainly much weight in controlling the action of the Indian Office at this

time, he having but recently left his agency. Upon returning, he repeated his requests by telegraph from Sioux City, saying that he should be out of subsistence for his people on or about the 10th of July. On the same day he was notified that the Department had made definite arrangements to supply him as well as the other agencies on the Missouri River; yet a few days after he telegraphs that he had an abundance of cattle, which it seems he had received from the commissary contractor, but of which this office had no notice or information, and when, therefore, those contracted for by the office reached there he declined to receive them.

Having already, acting upon the information of Captain Poole and other agents, contracted as stated, the office could not legally recede, and therefore ordered him to receive the cattle, and sent letters to the other agents to do the same. The information upon which the office acted was in all cases positive, that supplies were getting short.

Respecting the allegation that the board of Indian commissioners were not consulted in the purchases made of beef and flour, I have only to say that the act authorizing such consultation and inspection passed on the 15th of July, 1870, while the contract complained of was made June 17, 1870, nearly one month preceding the passage of the act.

Respecting the enormous profits made by the contractors, I can say that I know nothing about it. They will probably be called by the committee of the House charged with the investigation of this matter to reveal the prices paid by them to execute their contracts and the profits they made.

In conclusion, I desire to express a conviction which has forced itself upon my mind that these gratuitous charges upon the Indian Office is but a determination to carry out certain theories put forth by Mr. Welsh in 1869. It will be recollected that in April, 1869, President Grant appointed Mr. Welsh as one of the Indian commissioners authorized to be appointed under the act of Congress of April 10, 1869. He then claimed that the expenditure of all Indian appropriations was also intended to be placed in the hands of said commission. To this proposition the Hon. J. D. Cox, then Secretary of the Interior, and myself dissented, and in which we were sustained by the President. He then resigned from the commission and has since labored as a voluntary agent, keeping, it seems, a watchful eye upon the transactions of the Indian Office, with a view to detecting irregularties and exposing them, and thereby taking from it the management of the Indian funds. The determination of the President to call in the religious element of the country to aid him in the management of Indian affairs, and the Episcopal Society, of which I understand Mr. Welsh is a prominent member, having had assigned to them most of the Dakota district as their special field of labor, has opened the most plausible pretext to renew the attempt of 1869, at least so far as that society has acquired jurisdiction in Dakota, notwithstanding the Indian Office has maintained the peace and kept the Indians comparatively quiet there and elsewhere. I will not assert that he and his associates or any other religious organization are not as competent to manage and disburse Indian funds as the Indian Bureau, but there being at present no law authorizeing such a course the Bureau is bound to repel all such attempts. Since the accession of President Grant to the office of Chief Executive of the Nation, the Indian Bureau has been conducted solely and wholly with a view to the maintenance of peace, and the avoidance of expensive and horrible Indian wars, the amelioration of their condition, and their advancement in civilization.

I also think it proper to remark, that during the past and preceding year, the communications from Mr. Welsh, relative to Indian affairs, have not always been couched in those terms which might be expected from one not authorized to dictate or control; but as there was a probability that his motive was a desire to promote the welfare of the Indians, his wishes have, as far as the same were practicable and not incompatible with existing laws, been complied with.

Very respectfully, your obedient servant,

E. S. PARKER,
Commissioner.

Hon. C. DELANO,
Secretary of the Interior.

PHILADELPHIA, *January* 9, 1871.

SIR: Your official note informs me that the Committee on Appropriations of the House of Representatives (of the sub-committee of which you are chairman) is charged with the investigation of certain irregular and unlawful conduct of the Commissioner of Indian Affairs, referred to in my letter to the Hon. Secretary of the Interior.

Although I did not suggest an examination by the House of Representatives, yet I will not shrink from a duty imposed upon me as a citizen of the United States, and therefore have arranged the statements of misconduct under the following heads, to enable your committee to make a thorough examination without loss of time, and also to enable the Commissioner of Indian Affairs to prepare specific answers.

You ask the names of witnesses I desire to have summoned. As the documentary testimony in the Indian Office, and with the Second Auditor, Commissary General, and Quartermaster General, will present the case fully, I do not desire to have witnesses sent for, but it may become necessary in the course of investigation.

Yours, very respectfully,

WM. WELSH.

Hon. A. A. SARGENT,
Chairman, &c., Washington, D. C.

Statement of misconduct in the Indian Office.

First.—Extensive purchases of cattle, flour, groceries, &c., by private contract, about June 17, August 10, 1870, and at other times, in direct violation of a law of the United States, which requires such supplies to be advertised for in the public newspapers before purchases are made.

Second.—Large purchases made nearly a month before the passage of the appropriation bill, and therefore without warrant of law, and to an extent not warranted by any exigency—the payments to one individual alone amounting to more than three hundred and thirty-five thousand dollars. The letters of June 18, 1870, from the Indian Office to Agent Poole and others, show conclusively that there was no exigency requiring large purchases, as one-third of the cattle were to be delivered about July 15, one-third August 1, and one-third September 1, 1870.

Third.—A violation of the appropriation bill passed July 15, 1870; section 3 making it the express duty of the Commissioner of Indian Affairs to consult the board of commissioners in making purchases of all goods to be paid for under said appropriation bill; large purchases of beef, flour, &c., having been made without the knowledge of said board of commissioners.

Fourth.—Section 3 of said appropriation bill makes it the duty of the board of Indian commissioners "to supervise all expenditures of money appropriated for the benefit of Indians in the United States, and to inspect all goods purchased for said Indians, in connection with the Commissioner of Indian Affairs, whose duty it shall be to consult said commission," &c. This well-defined duty imposed on the Commissioner of Indian Affairs was only complied with in the supervision and inspection of dry goods, and wholly neglected in other and far more extensive and important expenditures of money.

Fifth.—Culpable neglect in not ascertaining by telegraph or otherwise how much beef and other supplies were likely to be furnished by contractors under the Commissary Department before making large purchases of beef, &c., as per contracts of June 17 and August 10, 1870.

Sixth.—Exorbitant prices paid for provisions about June 17 and August 10; six and one-half cents per pound being the contract price for Texas cattle on the hoof, to be *received* and *receipted* for by the agent *immediately* on the arrival of the herd. The Commissary Department was at that time supplying the agencies at 4.45 cents per pound, and a contract, when properly advertised, was subsequently made by the Indian Department at 3.88 cents per pound. In both cases the contractor was bound to *keep the cattle at his own expense and risk, deliverable as required by the agent from time to time during the period of nine months.* The contractor for the cattle at 6½ cents is also a partner in the contract at 3.88 cents. He and others in the cattle business admit that the cost and risk of keeping Texas oxen in that stormy region and near hostile Indians, for delivery as needed, exceeds 1¼ cent per pound, which deducted from the 4.45 and 3.88 make the purchase at 6½ cents for prompt delivery equal to an advance of 100 per cent. on the commissary's contract, and 150 per cent. on the contract made by the Indian Office in *pursuance of law* after proper public advertisement. I was credibly informed, and believe, that the cattle delivered in November at 6½ cents a pound cost but 2¾ cents at some reservations, 2.85 cents at others, and 3 cents at the most remote. I am offered oxen in full supply for the next season at 2¾ cents a pound, delivered on the banks of the Missouri River from June 15 to July 1, although the price of cattle has materially advanced in Texas since last spring. The best of the cattle, say 4,000 head, of the 3.88 cents contract, cost 3 cents a pound, because they were bought so late that they could not reach Grand River before the close of November. I was credibly informed, and believe, between two and three thousand cattle under the same contract were very inferior to the others, and that some of them cost 2½ cents a pound, or less.

Seventh.—The following wrongful and censurable instructions to agents, dated Indian Office, June 18, 1870: "If the quantity of any or all of the articles delivered should vary from the foregoing, either more or less, it will make no particular difference. You will give Mr. Bosler proper receipts for all the supplies furnished by him at the time of the delivery." "The foregoing instructions" notified the agents at Whetstone that one-third of the cattle would be delivered, each, about July 15, August 1, and September 1,

1870. Mr. Bosler notified the agent that he would thrust upon him about one thousand cattle by July 20. The agent remonstrated, as he had then nearly three months' supply on hand. A telegram from the honorable Commissioner of Indian Affairs, dated July 20, 1870, compelled him to receive from J. W. Bosler all the cattle he brought, say 839 head, in addition to the 1,200 already on hand at the agency. The agent reports that these additional cattle will cost him $600 per month for herders, in addition to the cost of their rations, and that he apprehended a large loss to the Government from stampeding and other casualties. As these letters of instructions show that the contractor might deliver in July, August, and September, a plea that the contract for supplies was made to meet an exigency has no foundation in fact; and the reason for this *very peculiar clause* became manifest on this, and especially on subsequent occasions, for deliveries of 6½-cent cattle were made in November, and attempts were made in the same month to force 7,000 additional oxen on the agents, contrary to contract.

Eighth.—The neglect to advertise for proposals to furnish cattle, immediately after the passage of the appropriation bill, July 15, is not only culpable, but seems to be something worse, when coupled with the fact that additional cattle, to the extent of more than $155,000, were purchased privately on or about August 20, and were allowed to be delivered as late as November 14, when, under the advertised contract, cattle were to be ready for delivery as early as the 15th of October, at 3.88 cents a pound.

Ninth.—Neglect in not notifying the Second Auditor of the receipt of a notification from Agent Randall, of Cheyenne, that his sub-agent had receipted for Texas cattle at twelve hundred pounds, instead of nine hundred and thirty-eight pounds, the actual weight, &c. Also, culpable remissness in paying large sums of money on vouchers from irresponsible persons, not officially known to the Department, said vouchers not giving the number of the cattle, or stating whether they had been weighed or estimated, and by whom, or, in the case of net weight of beef, whether the oxen had been killed, or how the estimate had been made.

Tenth.—Neglect in not sending a copy of the contract of September 17 to the various agents, as had been done with the private Bosler contract. The instructions of June 18, to receive without restriction, had not been revoked, but had been strengthened by the telegram of July 20, from Commissioner Parker, ordering Captain Poole to receive without limit. That there was collusion in an attempt to defraud the Government, is more than probable from the following reasons: 1. J. W. Bosler, the contractor at 6½ cents, is also a partner in the contract of September 17, at 3.88 cents, and he avers that Governor Carney, the representative of another ring, or combination of bidders, offered $40,000 if the bid of 3.88 was withdrawn. 2. A nine months' supply of oxen, say nearly 7,000 cattle, would not have been driven to the Missouri region in November if the contractors had expected to be held to their bargain. 3. No preparations were made by the contractors to keep the cattle, or to kill them and freeze the beef. That is, no hay was provided, no horses purchased, no herders hired, and no houses erected for protecting frozen beef. 4. A partially successful attempt was made by the contractors, or their agents, to force these cattle on the Indian agents; and they would have been largely, or perhaps wholly successful, if I had not, when in Washington, demanded to see the contract, and was therefore prepared to caution the Indian agents. Before I reached Crow Creek some 400 of these cattle had been forced on an agent who had already resigned. He averred that he had given a temporary receipt under false representations. These new cattle caused his whole herd to stampede.

Eleventh.—Wastefulness of the public money in purchasing other articles, all from the same favored contractor; say bacon, (with the rib bones,) at 25 cents per pound; coffee at 28 cents per pound; common sugar, made from molasses, at 18 cents per pound; inferior tobacco at 85 cents per pound, and flour at 6½ cents per pound, delivered at the agencies. Also, in buying from the same person, a resident in Pennsylvania, 25,000 ninety-eight-pound sacks of second-quality flour, at $3 50 a sack, delivered at Sioux City, where the market price was $2 20, purchasing all privately from one person instead of advertising according to law, and not allowing bids of one thousand sacks or more, that persons living near the reservation might find a market for their products and manufactures. Wheat could have been contracted for at from 1 to 1½ cent per pound, and a more nutritous diet manufactured on the reservation, with existing machinery, at less than half the cost of the flour furnished.

Twelfth.—Exorbitant rates paid for freight up the Missouri River, by not encouraging or allowing competition.

Thirteenth.—Grievous wrong to the Indian service by allowing peculiar facilities to a superintendent or superintendents, agent or agents, having strong political friends, by which the Government has been defrauded or the welfare of the Indians retarded.

WM. WELSH.

PHILADELPHIA, *January* 9, 1871.

WASHINGTON, D. C., *January* 13, 1871.

DEAR SIR: I have the honor to acknowledge the receipt of your communication dated January 11, 1871, in which, by instructions of the Committee on Appropriations of the House of Representatives, you forward me, inclosed, a copy of a communication of William Welsh, esq., dated Philadelphia, January 9, 1871, and stating that you will receive any reply that I may be pleased to make.

I do not understand, from your communication, that I am personally or officially called upon to answer before your committee for any misconduct in office, or that, beyond the accusations contained in the letter of Mr. Welsh and matters connected therewith, there is anything pertaining to my administration, as Commissioner of Indian Affairs, into which you propose an investigation. I address myself, therefore, at once to the charges made by Mr. Welsh.

First. That I made extensive purchases of cattle, flour, groceries, &c., about June 17 and August 20, 1870, and at other times, in violation of law, I deny.

Second. That I made large purchases a month before the passage of the appropriation bill (of July last, I suppose he means) without warrant of law, and not warranted by any exigency, I deny.

Third. That I made purchases, in violation of section 3, appropriation act, approved July 15, 1870, I deny.

Fourth. That I violated said section 3, by reason of matters contained in said charge, I deny.

Fifth. That there was any culpable neglect, on my part, in not ascertaining the quantity of supplies likely to be furnished by the Commissary Department, before making purchases June 17 and August 20, 1870, I deny.

Sixth. As to many of the allegations in charge sixth I have no knowledge. That I purchased beef cattle in July and August, 1870, at prices greater than subsequently paid for beef cattle delivered under contract is true. But my action in the matter was based upon the necessities and circumstances then surrounding me, which I will fully explain to the committee if it is desired.

Seventh. That I issued any wrongful and censurable instructions to agents, relative to receiving supplies in July or August, 1870, or at any other time, as alleged, I deny. My instructions are to be found in the Office of Indian Affairs, and will be furnished, together with any explanation your committee may require.

Eighth. That I was guilty, as charged, of any culpable neglect in the matter of advertising for proposals after the passage of the appropriation bill of July 15, 1870, I deny. As to purchases subsequently to the passage of the act I will make full answer whenever informed by the committee that such answer is desired.

Ninth. That I was guilty of culpable neglect and remissness, in failing to give proper notice to the Second Auditor in any matter whatever, or that I was so guilty in paying vouchers of any character, as charged, I deny.

Tenth. That I was guilty of neglect in not sending a copy of the contract of September 17, 1870, to the various agents, as had been done with the contract of J. W. Bosler, or that there was any collusion between Mr. Bosler and myself, I deny. Whether "there was collusion in an attempt to defraud the Government" between persons other than myself, as is by Mr. Welsh asserted to be probable for reasons stated by him, I know not. But that I had knowledge of any such collusion or had aught to do with it, if such attempt was made, I deny.

Elereuth. That I was guilty of "wastefulness of the public money in purchasing other articles from Mr. Bosler," as alleged by Mr. Welsh, I deny. That I should have provided cracked wheat for the Indians instead of flour is a matter of policy, in supplying these people, about which there may be honest difference of opinion, and I suppose I need suggest nothing further in reply to the charge that I preferred to furnish flour.

Twelfth. That "I paid exorbitant rates for freights up the Missouri River by not encouraging or allowing competition," I deny.

Thirteenth. That I was guilty of "grievous wrong to the Indian service by allowing peculiar facilities to a superintendent or superintendents, agent or agents, having strong political friends, by which the Government has been defrauded or the welfare of the Indian retarded," I deny.

Your committee will observe, upon reading the charges numbered from one to thirteen inclusive, that, in some cases, they contain statements of facts of which I can have no knowledge; that they abound in inferences of the person making them which do not necessarily follow from the facts themselves; that they cover a wide range of inquiry, not only into particular transactions, but the general policy of the Indian Office; that they are often vague and uncertain in allegations of facts, but of this I care little. There are substantial averments which concern me personally and officially, and all such I stand ready to answer.

Your committee now have the charges and my reply.

I suppose the just and proper course in such investigations will be pursued, and that the accuser will be called upon to make good his charges.

To the extent of all knowledge in my possession I offer my assistance.

I only ask to be permitted to be present when witnesses are called and have the privilege of cross-examination; to be furnished with a copy of the evidence, if consistent with your rules of procedure, and to be permitted to call witnesses myself to explain any matter deemed important where witnesses may be necessary.

I have the honor to be your obedient servant,

E. S. PARKER.

Hon. A. A. SARGENT,
Chairman Sub-Committee, &c., House of Representatives.

EXECUTIVE OFFICE, YANCTON, DAKOTA TERRITORY,
April 16, 1870.

SIR: I have the honor to inclose herewith a communication from Brevet Major George M. Randall, Indian agent, dated the 9th instant, reporting that six thousand five hundred Indians are now at the Cheyenne agency, and asking to have furnished, with as little delay as possible, one month's supply of sugar, coffee, and bacon for their subsistence until June 30.

Very respectfully, your obedient servant,

J. M. MORTON,
Secretary

Hon. E. S. PARKER,
Commissioner Indian Affairs, Washington, D. C.

CHEYENNE AGENCY, DAKOTA TERRITORY,
April 9, 1870.

SIR: I have the honor to state that I am at present subsisting six thousand five hundred Indians at this agency, and, at the least calculation, three thousand more than was expected here for subsistence, and they are daily arriving. I most respectfully request that at least one month's supply of sugar, coffee, and bacon be sent here with the *least possible delay*, as the amount I have on hand will not last over forty days; with the quantity asked for and with what I have on hand will, in my opinion, be sufficient to subsist them until the 30th June.

I may state that the original weight of the bacon when received here was 121 pounds to the sack. It wasted to such an extent that I would not receive it from the acting commissary of subsistence, at its original weight, until determined on by a board of survey from Fort Sully, who weighed it and found that it averaged 107 pounds to the sack. Had the bacon held out at its original weight, in all probability I would have had sufficient to last until the 30th June.

I most urgently request that a sufficient quantity of sugar and coffee (green) be sent here to enable me to double the ration, in order to keep the hostile Indians as peaceable as possible while they remain here, as the present ration is entirely too small.

I am, sir, your obedient servant,

GEO. M. RANDALL,
Captain and Brevet Major U. S. A., Indian Agent.

Hon. JOHN A. BURBANK,
Governor and ex-officio Superintendent Indian Affairs, Yancton, D. T.

EXECUTIVE OFFICE, YANCTON, DAKOTA TERRITORY,
April 30, 1870.

SIR: I have the honor to inclose herewith a letter from agent J. A. Hearn, dated April 19, 1870, reporting amount of subsistence stores on hand at the Grand River agency.

Very respectfully, your obedient servant,

J. M. MARTIN, *Secretary.*

Hon. E. S. PARKER,
Commissioner of Indian Affairs, Washington, D. C.

GRAND RIVER AGENCY, DAKOTA TERRITORY,
April 19, 1870.

SIR: I have the honor to inform you that the supply of coffee, sugar, and bacon at this agency will not last longer than the 15th of May, 1870; flour up to the 1st of July, 1870; corn and salt up to May, 1871.

I am, very respectfully, your obedient servant,

J. A. HEARN,
Captain and Brevet Major United States Army, Indian Agent.

P. S. Nearly 7,000 Indians are drawing rations at this place.

J. A. HEARN,
Brevet Major United States Army, Indian Agent.

Hon. JOHN A. BURBANK,
Governor and ex-officio Superintendent Indian Affairs, Yancton, D. T.

[By telegraph from Indianapolis.]

MAY 2, 1870.

Hon. E. S. PARKER, *Commissioner of Indian Affairs:*

Major Randall, Cheyenne agency, writes under date April 16th to send one month's supply of flour. Must be sent him for the same number of Indians as stated in his letter of 16th ultimo, with least practicable delay; also, if the Indians continue to arrive as they have for the past three weeks, his rations will not hold out for over twenty days.

JOHN A. BURBANK,
Governor and ex-officio Superintendent Indian Affairs.

OFFICE COMMISSARY GENERAL OF SUBSISTENCE,
Washington City, District of Columbia, May 27, 1870.

SIR: I would respectfully invite your attention to the following extract from a letter of May 17, 1870, from Brevet Captain W. H. French, jr., Indian agent at the Crow Creek agency, Dakota Territory, to Brevet Major General H. F. Clarke, acting commissary general of subsistence, viz: "I was instructed from the Indian Department to receive cattle from the contractor only as they are needed; this will leave about forty-eight head on his hands at the expiration of each month, which should be received by the department under the contract."

General Clarke states that "if the number of beef cattle provided to be delivered per month at Crow Creek agency should be offered by the contractor to June 30th next and not accepted, the contractor would have cause to complain, and would doubtless claim damages."

As the contract was made solely for cattle to be transferred to your department, I have to request that the Indian agents at Crow Creek, and other agencies on the Missouri River, at which the Subsistence Department is providing beef cattle, may be instructed to receive, on or before the 30th instant, all cattle due under the contract at their respective agencies.

Very respectfully, your obedient servant,

A. B. EATON,
Commissary General Subsistence.

Hon. E. S. PARKER,
Commissioner of Indian Affairs.

DEPARTMENT INTERIOR, OFFICE INDIAN AFFAIRS,
June 1, 1870.

SIR: I am in receipt of your letter of the 27th ultimo, relative to the beef cattle to be delivered at the Crow Creek agency, under contract made by your Department, and requesting that the agents at all the agencies on the Missouri River, at which the Subsistence Department is providing beef cattle, be instructed to receive, on or before the 30th instant, all the cattle due under the contract at their respective agencies. You are advised in reply that the necessary instructions have this day been issued to Governor Burbank, ex-officio superintendent of Indian affairs for Dakota, to direct said agents to receive all the cattle that, under the contract or contracts made by your Department, are to be delivered at their respective agencies, up to the end of the present month.

Very respectfully, your obedient servant,

E. S. PARKER, *Commissioner.*

General A. B. EATON,
Commissary General of Subsistence, Washington, D. C.

DEPARTMENT OF THE INTERIOR, OFFICE INDIAN AFFAIRS,
June 1, 1870.

SIR: I am in receipt of a letter from commissary general of subsistence, dated the 27th ultimo, requesting, for reasons given by him, that the agents at all the agencies on the Missouri River, at which the Subsistence Department is providing beef cattle, be instructed to receive, on or before the 3d instant, all the cattle due at their respective agencies under the contract made by said Department.

As the contract referred to was made solely for beef cattle to be issued to Indians, in accordance with an arrangement made by this Bureau with the Subsistence Department, and as all the cattle agreed to be furnished under it will doubtless be required to feed the Indians at the different agencies in your superintendency where subsistence is now being delivered by said Department, you will please instruct the several agents to receive, before the 1st proximo, all the cattle agreed to be furnished by the terms of said contract at their respective agencies.

Very respectfully, your obedient servant,

E. S. PARKER,
Commissioner.

Hon. JOHN A. BURBANK,
Governor, &c., Yancton, Dakota Territory.

OFFICE ACTING COMMISSARY SUBSISTENCE,
WHETSTONE AGENCY, DAKOTA TERRITORY,
June 4, 1870.

COLONEL: I have the honor to transmit herewith requisition for supplies for five thousand Indians from July 1, 1870, (three months,) to be fed from this agency.

I would state that the Indian agent at this agency has requested that he be furnished with these supplies for the purpose of *maintaining peace* and keeping the Indians upon their reservation during that period.

Very respectfully, your obedient servant,

A. E. WOODSON,
First Lieutenant United States Army and Acting Commissary Subsistence.

Brevet Lieutenant Colonel T. C. SULLIVAN,
Supervising Commissary for Sioux Indians, Sioux City, Iowa.

A true copy:

C. McCLURE,
Brevet Major and Commissary Subsistence.

Requisition for subsistence supplies for the use of Indians at Whetstone Creek agency, Sioux Indian district, Dakota Territory, for ninety-two days, commencing on the 1st day of July, 1870, and ending on the 30th day of September, 1870.

Whetstone Creek agency, Dakota Territory.	NUMBER—			POUNDS OF—						Remarks.
	To be supplied.	Of days.	Of rations.	Bacon.	Beef, (net.)	Flour.	Coffee.	Sugar.	Soap.	
Indians	5,000	92	460,000	45,000	600,000	230,000	9,200	18,400	4,600	These stores are required to be at this agency before the 1st July, 1870.
No. of pounds needed for use				45,000	600,000	230,000	9,200	18,400	4,600	
No. of pounds that will be on hand July 1, 1870.....				.....	.....	.....	.....	.....	.....	
No. of pounds required for use				45,000	600,000	230,000	9,200	18,400	4,600	

A. E. WOODSON,
First Lieutenant and Acting Commissary Subsistence U. S. A.

A true copy:

CHAS. McCLURE,
Brevet Major and Commissary Subsistence.

HEADQUARTERS MILITARY DIVISION OF THE MISSOURI,
OFFICE CHIEF COMMISSARY OF SUBSISTENCE,
Chicago, Illinois, June 15, 1870.

GENERAL: Herewith I have the honor to inclose a requisition just received for subsistence supplies for use of Indians at Whetstone Creek agency, Dakota Territory, for three months, commencing July 1, 1870.

The requisition was not called for from this office, and under the instructions you have given me in relation to future subsistence supplies for Indians, it can receive no action here, and perhaps it should not be referred to your office; yet as no evil can result therefrom, I have thought it best to so refer it.

Very respectfully, your obedient servant,

H. F. CLARKE,
Brevet Major General, Acting Commissary General Subsistence,
Chief Commissary Subsistence, Military Division Missouri.

Brevet Major General A. B. EATON,
Commissary General Subsistence United States Army, Washington, D. C.

A true copy:

CHAS. McCLURE,
Brevet Major and Commissary Subsistence.

OFFICE COMMISSARY GENERAL OF SUBSISTENCE,
Washington City, June 18, 1870.

SIR: I have the honor to submit to the Secretary of War, with the suggestion that it may be transmitted through the Secretary of the Interior to the Commissioner of Indian Affairs, a copy of a communication of the 15th instant, from Brevet Major General H. F. Clarke, assistant commissary general subsistence, chief commissary subsistence, Military Division of the Missouri, inclosing a copy of a letter of June 4, 1870, from the acting commissary of subsistence of the Whetstone Indian agency, Dakota Territory, accompanied by a requisition for subsistence supplies for the use of Indians at that agency from the same officer, who remarks in his letter that the "Indian agent requested these supplies," &c.

It is known to yourself, as also to the Secretary of the Interior and to the Commissioner of Indian Affairs, that it has been decided that the Subsistence Department shall complete its agency in the subsistence of the Indians referred to by ordering the transfer to the several Indian agents at the agencies on the Missouri River reservation all the subsistence supplies and property that have been accumulated at those several agencies, for issue thereat, for and within the current fiscal year, and that thus there was no provision or authority for the acting commissary at the Whetstone agency to take any steps for the further subsistence of those Indians. The Subsistence Department having completed its limited agency in that matter, the question of further supplies for those Indians is not one for the determination of the War Department.

I have the honor to be, very respectfully, your obedient servant,

A. B. EATON,
Commissary General Subsistence.

Hon. W. W. BELKNAP,
Secretary of War.

WAR DEPARTMENT,
Washington City, June 18, 1870.

SIR: I have the honor to inclose herewith, in the absence of the Secretary of War, and by his direction, a copy of a requisition for 450,000 rations, drawn by the Indian commissary at the Whetstone Creek agency in Dakota Territory, upon the Subsistence Department of the Army, being the needed supplies for 5,000 Indians, from July, to September 30, 1870. As the existing arrangement for supplying rations to peaceful Indians is about to terminate, no action upon the requisition can be taken by this Department.

Very respectfully, your obedient servant,

E. D. TOWNSEND,
Adjutant General.

The Hon. SECRETARY OF THE INTERIOR.

EXECUTIVE OFFICE, YANKTON, DAKOTA TERRITORY,
June 17, 1870.

SIR: Believing that nothing should be left undone on the part of the Government to retain the good-will of the Yankton tribe of Indians, and keep them, as the great portion of them have been, the firm friends of the whites, as well as to be ready to organ-

ize them for our defense in case of an outbreak which we are at any time liable to have, I deemed it my duty to drop all other matters and go there in person, not only for the purpose of examining into the cause of the burning of the barn, stock, &c., but to make a personal examination into their affairs, and endeavor to find out if any portion of them were disposed to affiliate with hostile and disaffected Indians, who are using every means to render them discontented and induce them to withdraw their friendship from the whites.

I find that whenever any members of this tribe visit the Tetons, or they make a visit to the Yankton reservation, the friendly Indians are told that they are poor and often hungry; that the Government does not feed and clothe them as it does the hostile Indians, and that so long as they remain friendly to the whites they will be neglected and uncared for; that if they wish to live well and have all they want, they must join them, go on the war path, take all the white man has got, and flee to the Black Hills. When this is gone they can return for more; and when they get tired of this or find that it is better to prepare for winter, they can commit a few murders, and the Great Father will get scared and send commissioners to treat with them, who will be supplied with all they need and will send boat-loads of provisions and presents of goods. This, they urge, is much better and more honorable than to remain on a little piece of land and have to work, which they regard as a disgrace and not even reputable for squaws to do. There is no doubt that these hostile Indians exercise an influence over many of the Yanktons, and while the older and better Indians discountenance the efforts made to create disaffection, yet they feel that they are neglected, and they cannot understand that while they have treaty stipulations which are fulfilled to the letter, besides receiving a much larger amount than is actually due them in presents, the Government should at the same time take care of those who are not its friends, and who are not endeavoring to cultivate the soil or take any steps toward civilization.

Notwithstanding we have the friendship and good-will of the head-men, we are compelled to either feed this tribe or fight them, and to treat them fully as well as any tribe or band of Sioux, regardless of the amount we agreed to give them by treaty stipulation, or incur their hostility.

The moment we fail to do this we can depend upon an outbreak, and all will join in against us except a few old men who may remain as figure-heads.

By giving them a partial ration the present stock of subsistence will last until the first of July; and unless some means are taken to furnish them with another supply by the time this is gone, or to give them the assurance that a supply is coming, I am satisfied that it will be impossible to keep a large portion from leaving the reservation and joining the hostile Indians, which will, in my opinion, lead to the formation of small war parties to raid upon the unprotected settlers upon the borders of their reservations.

I verbally directed Major Goodhue to submit an estimate of subsistence to last for three or four months, which will be forwarded with proper suggestions as soon as received.

While on the reservation the trading house opposite Fort Randall was fired for the second time, but was fortunately again discovered in time to save it, with but a small loss to the building. At the same time the granary close by, belonging to the stage company, was burned to the ground. This, with the attempt to burn the store, as heretofore reported, and the loss of the barn, horses, &c., goes to show that there is a determination on the part of some one to continue burning property.

The chiefs in council state that they have made due inquiry and endeavored to find out who was destroying their property, but have failed to do so. They also state that they have a few bad men, who do not live among them but occasionally come there to visit their relatives, and that one of these men was on the reservation at the time the barn was destroyed.

They seem to be very much dissatisfied with the head farmer; charge that he refused to feed one of their chiefs when he was at his house; that he has pushed two of their young men and hurt them, and that they had great difficulty in preventing them from having revenge in their own way; also, that when there is work to do he has been giving it to white men instead of Indians. I deemed it best, however, not to order the head farmer discharged, as the crops are now growing, and a change should be avoided at this time unless a certainty existed that a man could be got who was perfectly familiar with the agency.

There are a great number of rumors flying up and down the river that the Indians are on the war path, and this agency being directly on the line of travel, there is hardly a day passes but that something new and startling is reported to have taken place. I find that the Indians as well as the whites are alarmed, and fear depredations will be committed, or, perhaps, an attack made.

The Indians seem to think that it is best for them to organize three parties to patrol their reservation; one at the east end in the vicinity of Choteau Creek, one at the west end nearly opposite Fort Randall, and the other to scout over the prairie back of the agency. The difficulty that I see in the way of their plan is that—

1st. We should have to furnish them with arms and ammunition.

2d. We should have to furnish them with rations in addition to what they are now receiving.

3d. If we expect them to perform this service they will soon demand pay for it.

They cannot understand why it is that the Government employs soldiers who are paid, while the same funds, clothing, &c., cannot be given to them.

There is no doubt as regards the duty of the Indian Department to see that the agencies are properly protected, and as a war party have already been seen watering their horses nearly opposite Fort Randall, and as the Yanctons have been threatened by the hostile Indians on account of their friendship to the whites, some steps should be taken toward their defense. If it can be so arranged that the Indians can be mustered as a police force, paid, and fed as our troops are, I should much prefer to see this course adopted. If not, I deem it my duty to recommend that a full company be stationed at this agency at the earliest moment possible.

There are so many wants of the Indians in this agency, so many calls for articles needed, so much that ought to be done, all of which calls for an outlay of money, that were I to enumerate the smallest portion you would think that I was not aware that there were but forty thousand dollars allowed by treaty stipulations.

There are certain things that we must have and expenses that we will have to create if we attempt to even make a show of carrying on the business of an agency, a few of which I will enumerate, leaving the balance for some other time:

A good portable mill must be furnished at the earliest moment possible, also a good threshing machine, with horse-power attached, and a suitable barn to replace the one destroyed.

The present store-house is about falling down, and will have to be underpinned with stone. A new roof is also required, together with other repairs; so that I am not prepared to say, at this time, whether it will be most advisable to build a new one or repair the old.

The present buildings for employés are almost uninhabitable; but economy demands that they shall be used as long as possible.

A number of these Indians are well pleased with the idea of having their land set apart to them, and now ask for agricultural implements. These should be furnished so far as they will take the proper care of them.

The present agent has had but little experience with Indians; but from what I can see I believe him to be a good man and that he will soon make a good and efficient agent.

Very respectfully, your obedient servant,

JOHN A. BURBANK,
Governor and ex-officio Superintendent Indian Affairs.

Hon. E. S. PARKER,
Commissioner Indian Affairs, Washington, D. C.

EXECUTIVE OFFICE, YANKTON, DAKOTA TERRITORY,
June 18, 1870.

SIR: Herewith find inclosed monthly report of Brevet Major J. A. Hearn, of Grand River agency, for the month of May.

Allow me to call your attention to the statement that the flour, bacon, sugar, and coffee will last only till July 1. You are well aware that we must feed or fight the Indians in this superintendency, and by failing to have full supplies on hand we furnish the disaffected with an argument, or pretext at least, to compel those who are disposed to be friendly to join them.

I trust that you have the means at your command to send a full supply at once; but, if not, I hope that you may devise some means whereby subsistence can be kept on hand at this and all the other agencies.

Very respectfully, your obedient servant,

JOHN A. BURBANK,
Governor and ex-officio Superintendent Indian Affairs.

Hon. E. S. PARKER,
Commissioner Indian Affairs, Washington, D. C.

GRAND RIVER AGENCY, DAKOTA TERRITORY,
June 2, 1870.

SIR: I have the honor to make the following report for the month of May, 1870:

The number of Indians at this agency is the same as stated in my last report—one thousand and twenty-eight (1,028) lodges. They are continually going out and coming in. I expect that by the end of this month one hundred lodges will leave here.

As soon as the remaining Indians will have received their annuities, a large number are going out in the interior on their usual summer hunt.

The conduct of the Indians is much the same as stated in my last report—remarkably good.

The supply of provisions on hand will hold out as follows: Flour, bacon, sugar, and coffee will last only to July 1, 1870.

I earnestly request that supplies be forwarded as soon as possible, as the deportment of the Indians deserves that the Government should promptly comply with the conditions of their treaty.

The chiefs are always anxious to hear any news concerning them, and wish to know when their annuities will be forthcoming, &c.

Companies A and F of the Seventeenth United States Infantry arrived here May 20, 1870, under command of Lieutenant Colonel Samuel B. Hayman. They are quartered on the agency for the time being.

Good feeling prevails between the Indians and troops, and I have no reason to believe that there is any danger of the Indians resuming hostilities against the Government.

Very respectfully, your obedient servant,

J. A. HEARN,
Captain and Brevet Major United States Army.

Hon. E. S. PARKER,
Commissioner of Indian Affairs, Washington, D. C.,
(Through Hon. J. A. Burbank, superintendent.)

EXECUTIVE OFFICE,
Yancton, Dakota Territory, July 4, 1870.

SIR: Herewith inclosed I have the honor to transmit letter of Brevet Major J. A. Hearn, of Grand River agency, dated June 18, relative to the supply of subsistence stores at that place. It is anticipated by your favor of the 27th ultimo.

Very respectfully, your obedient servant,

JOHN A. BURBANK,
Governor and ex-officio Superintendent Indian Affairs.

Hon. E. S. PARKER,
Commissioner Indian Affairs, Washington, D. C.

GRAND RIVER AGENCY, DAKOTA TERRITORY,
July 1, 1870.

SIR: I have the honor to make the following report for the month of June, 1870:

The number of Indians located at this agency the past month was 1,006 lodges; they have behaved themselves remarkably well. We are entirely out of flour and bacon. Coffee and sugar will last until July 31, 1870, and corn until January, 1871.

Many Indians are dissatisfied, and think the Government is going to stop feeding and clothing them, as their supply of provisions for the coming year has not arrived, and they are living on corn and beef.

I respectfully request that supplies be forwarded as soon as possible, if they are not already on the way.

I am, very respectfully, your obedient servant,

J. A. HEARN,
Captain and Brevet Major U. S. A., Indian Agent.

Hon. E. S. PARKER,
Commissioner of Indian Affairs, Washington City, D. C.
(Through Hon. J. A. Burbank, superintendent.)

P. S.—Since writing the above, I have been informed that three young men, belonging to the "Oncpapa" band of Sioux, have stolen eight animals, as follows, viz:

John B. Dillon, one (1) American horse and three (3) mules; Thomas Smith, one (1) mule; George Carny, one (1) Indian horse; Commissary Department U. S. A., two (2) American horses.

J. A. HEARN.

GRAND RIVER AGENCY,
Dakota Territory, June 18, 1870.

SIR: I have the honor to report that the supply of the following subsistence stores at this agency will not hold out longer than the dates annexed to them respectively:

Bacon, June 30, 1870; beef, June 30, 1870; flour, June 30, 1870; coffee, July 31, 1870; sugar, July 31, 1870; soap, July 31, 1870.

I will respectfully state, long prior to this date I have notified both the honorable Commissioner of Indian Affairs and your office of the quantity of subsistence stores on hand, and the dates on which my supplies would be expended, but as yet I have heard nothing concerning supplies for this agency for the coming year.

I earnestly request and recommend that supplies be purchased and forwarded for the use of the Indians at this agency. I will state as my reason for so doing, that I consider it my duty to say, that certainly it would be injustice on the part of the Government not to promptly comply with the conditions of their treaty, as the conduct of the Indians at this agency during the past winter and spring deserves that they should be promptly complied with.

Very respectfully, your obedient servant,

J. A. HEARN,
Captain and Brevet Major United States Army, Indian Agent.

Hon. JOHN A. BURBANK,
Governor and ex-officio Sup't Indian Affairs, Yankton, Dakota Territory.

EXECUTIVE OFFICE,
Yankton, Dakota Territory, July 6, 1870.

SIR: I have the honor to inclose herewith report of Captain D. C. Poole, United States Indian agent at Whetstone, Dakota Territory, for the month of June, 1870.

Would respectfully call your attention to the expressed wish of the Indians of that agency in regard to making a buffalo hunt.

Very respectfully, your obedient servant,

JOHN A. BURBANK,
Governor and ex-officio Superintendent of Indian Affairs.

Hon. E. S. PARKER,
Commissioner of Indian Affairs, Washington, D. C.

WHETSTONE AGENCY, DAKOTA TERRITORY,
July 4, 1870.

SIR: I have the honor to forward herewith reports of the condition of affairs at this agency at the end of June, 1870.

I returned with delegation of Sioux Indians from Washington, District of Columbia, June 24. The delegation has held council with their people, and have informed me that they (their people) are very much pleased with the result of their visit, and are now waiting for arrival of annuity goods; at the same time are very anxious to make a buffalo hunt, which the delegation understood they would be allowed to do, while in Washington, and word would be sent to the agency as to the time and manner of their going. Spotted Tail and other chiefs have requested me to ask the Department for its decision, expressing the hope that his people may be allowed to go, as they are much in need of skins and robes and other necessaries which the buffalo supply to them. I have therefore again to request that their application be granted.

Spotted Tail and his people are also quite anxious to know when arrangements will be made to establish an agency for his people at the forks of the White River, as he understood while in Washington that steps would shortly be taken to that end.

I have receipted to the Commissary Department for about thirteen hundred head of beef cattle, which will last at present rate of issue nearly three months. The Indians are much pleased by knowing that these cattle are in hand for issue to them, as many were becoming uneasy, from being informed that the supply would run out at the end of the month of June. The supply of coffee and sugar has been exhausted, and I have borrowed from the commissary officer, (Colonel Whistler,) Fort Randall, a quantity sufficient to make next issue. As yet no stores have arrived to supply deficiencies, though I have been assured by the Department that they would be forwarded early in July.

All the corn planted by the Indians is doing well and gives promise of good yield.

The affairs of the agency generally are in a prospering condition.

Very respectfully, your obedient servant,

DE WITT C. POOLE,
Captain United States Army and Indian Agent.

Hon. JOHN A. BURBANK,
Governor and ex-officio Superintendent Indian Affairs, Yankton, Dakota Territory.

EXECUTIVE OFFICE,
Yankton, Dakota Territory, September 10, 1870.

SIR: I have the honor to transmit herewith report of Captain J. A. Hearn, of Grand River agency, for the month of July, inclosing report of Dr. S. S. Turner upon vaccination.

Very respectfully, your obedient servant,

JOHN A. BURBANK,
Governor and ex-officio Superintendent Indian Affairs.

Hon. E. S. PARKER,
Commissioner Indian Affairs, Washington, D. C.

GRAND RIVER AGENCY, DAKOTA TERRITORY,
July 31, 1870.

SIR: I have the honor to make the following report for the month of July, 1870:

The number of Indians located at this agency during the month was 1,006 lodges. They have behaved themselves very well.

I received provisions on the 15th of July, and the Indians were very well pleased, as a great number supposed that the Government was going to stop feeding them. They are very anxious about their annuities, as they wish to start on their fall hunt to get some robes, to procure some little articles from the traders, that are not furnished by the Government.

The Indians at this agency are desirous of making a treaty of peace with the Gros Ventres and Rees, and wish the Sioux Indians located at the lower agency to join them, as the Two Kettles and Yankton Indians cause all the trouble.

I inclose herewith Dr. S. S. Turner's report on vaccination.

I am, very respectfully, your obedient servant,

J. A. HEARN,
Captain and Brevet Major United States Army, Indian Agent.

Hon. E. S. PARKER,
Commissioner of Indian Affairs, Washington, D. C.
(Through Hon. John A. Burbank, superintendent.)

EXECUTIVE OFFICE, YANKTON, DAKOTA TERRITORY,
June 11, 1870.

SIR: I have the honor to transmit herewith letter of Agent French, of Crow Creek agency, of June 7, stating that the supply of bacon was exhausted the last of March, and that he has but three weeks' issue of sugar and coffee.

Allow me to most respectfully request that you take the proper steps to have a supply of the articles named sent at the earliest moment possible.

Very respectfully, your obedient servant,

JOHN A. BURBANK,
Governor and ex-officio Superintendent of Indian Affairs.

Hon. E. S. PARKER,
Commissioner of Indian Affairs, Washington, D. C.

CROW CREEK AGENCY, D. T., *June* 7, 1870.

SIR: I have the honor to report that the supply of bacon for the agency was exhausted on the last of March, and that I have but three weeks' issues of sugar and coffee on hand.

The bacon is an indispensable article with the Indians, without which they cannot cook their flour, they having no baking powders, nor the means to purchase them with, and have to rely entirely upon grease to make their bread rise.

The Lower Yanktonais at this place will be left in a very destitute condition should Congress fail to make an appropriation for their support. There is no game on their side of the Missouri River, and were they to hunt upon the territory of the Teton Sioux, they would be massacred by the hostile Indians.

Very respectfully, your obedient servant,

WM. H. FRENCH, JR.,
First Lieutenant and Brevet Captain U. S. A., U. S. Indian Agent.

Hon. JOHN A. BURBANK,
Governor and ex-officio Sup't Indian Affairs, Dakota Territory.

EXECUTIVE OFFICE, YANKTON, DAKOTA TERRITORY,
June 27, 1870.

SIR: On last evening I returned from a visit to the Ponca agency, where I found affairs, on the whole, in better condition than they were at this time last year. These Indians are decidedly a peaceful people, and seem more disposed to work and adopt the customs of the whites than their neighbors, the Sioux of Dakota.

A commencement has been made in the right direction by encouraging the leaders and the further advanced in civilization to commence erecting log houses, which has resulted in twenty being built in the last year, the Indians performing all the labor, except the carpenter work, while in each one that I visited I found a cooking stove, which the owner had purchased by saving the price from the annuity, or selling a pony for this purpose. I was very much gratified while visiting the school under charge of Mr. Reed, to find in attendance seventeen boys and six girls who were rapidly advancing, all having learned the letters and being able to pronounce them distinctly in our language, while several were much further advanced. I am told that not one of those present could speak our language before the school was started last winter.

The crops put in by the Indians look remarkably well, taking into consideration the dry weather that we are now having. Should we have rain in this vicinity soon, they must derive material advantage from them the coming winter. The agent informs me that he has twenty-five acres of wheat, and the Indians have nine acres. That belonging to the agency looks well and bids fair to be a good crop. In addition to this there are about twenty acres of sod corn put in for the purpose of feeding agency teams. I doubt, however, this amounting to much.

The Omahas and Pawnees sent word to the Poncas a short time since that they were going on a hunt, and, having a prospect of finding buffaloes on the Platte, the greater portion decided to go, as they were entirely out of meat of any description, leaving but a small number of their people at home.

The old people soon learned of my being at the agency, and came to see me. Some were blind, others lame; while they stated that they were hungry, and begged so piteously for something to eat, that it was really painful to be compelled to listen to their appeals. The morning before leaving, I saw a number of the old people who had got together out on the prairie with their cooking utensils, preparatory to cooking a meal, and in such a place that they knew I could not avoid seeing them. The eldest woman of the party commenced singing in a pitiful strain, and then praying to the Great Spirit to take pity upon them, and send them something to eat. The sight was so affecting that no one witnessing it could have refused to give them any assistance in his power.

When at Washington, last winter, I called your attention to these people, and verbally urged you to ask Congress to provide for them. I now have to lay their actual condition before you, trusting that you can and will devise some means to have this little tribe properly cared for. They are surely the friends of the Government, and are surrounded by enemies, who watch them so closely that they endanger their lives if they go on the bluffs, back of the Missouri bottom. Consequently they are cut off from all kinds of game, except when they are occasionally so fortunate as to obtain permission to join in with the tribes who are friendly toward them, and go on a hunt. Unless subsisted by the Government during the coming winter, they must starve.

The whole annuities appropriated for the coming year, including pay of employés and all other expenses of the agency for the fiscal year ending June 30, 1871, will not, if I am correctly informed, exceed $17,500, which is not sufficient for the purpose intended, and not one dollar of which can be spared for provisions, if we expect these Indians to continue making the progress toward self-support which they are now doing.

There are, in round numbers, seven hundred and fifty persons belonging to this tribe, who, if subsisted as the same number are elsewhere, would require 273,750 rations. Presuming that their crop will be a full one, I believe that if the closest economy is used, we can get along until June 30, 1871, with 100,000 rations, which I would recommend to consist as follows:

1 pound flour; 1 pound beef; ¾ pound bacon every fourth issue, in lieu of beef; 1½ pounds corn every fifteenth issue, in lieu of flour; 4 pounds coffee to the 100 rations; 6 pounds sugar to the 100 rations; 2 pounds salt to the 100 rations; 2 pounds soda to the 100 rations.

These supplies should commence arriving at the agency not later than August 1, at which time the tribe will have returned from their hunt. Much labor and expense were occasioned last year by sending the subsistence supplies to the Yankton agency, which required them to be hauled down stream fifteen miles, besides the additional difficulty of crossing the river. The Yanktons were very much dissatisfied, as they believed the rations sent there were intended for them, and even went so far as to

charge that they were being stolen from them, and to say that they should not be taken away. I have, therefore, to recommend that hereafter supplies be shipped direct to the Ponca agency.

Very respectfully, your obedient servant,

JOHN A. BURBANK,
Governor and ex-officio Superintendent of Indian Affairs.

EXECUTIVE OFFICE, YANKTON, DAKOTA TERRITORY,
July 27, 1870.

SIR: I have the honor to respectfully request information as to the action taken by the Department relative to my letter of June 27, asking that certain subsistence stores be furnished the Ponca agency.

Very respectfully, your obedient servant,

JOHN A. BURBANK,
Governor and ex-officio Superintendent of Indian Affairs.

Hon. E. S. PARKER,
Commissioner of Indian Affairs, Washington, D. C.

EXECUTIVE OFFICE, YANKTON, DAKOTA TERRITORY,
June 18, 1870.

SIR: In transmitting the inclosed letter of Major Goodhue, of Yankton agency, containing an estimate for subsistence for the Yankton Indians for four months, commencing July 1, I most respectfully direct your attention to my remarks upon this subject contained in letter of 17th instant, and to urge that proper steps be taken to have the subsistence furnished, so that a supply may be there by the 1st of July.

Very respectfully, your obedient servant,

JOHN A. BURBANK,
Governor and ex-officio Superintendent of Indian Affairs.

Hon. E. S. PARKER,
Commissioner of Indian Affairs, Washington, D. C.

YANKTON AGENCY, DAKOTA TERRITORY,
June 15, 1870.

SIR: I have the honor to herewith submit an estimate for rations required for use of Yankton tribe of Indians, numbering 2,000 souls, for the months of July, August, September, and October, 1870, being for the period of 123 days:

Flour, 123,000 pounds, at 4 cents per pound	$4,920 00
Beef, 214,000 pounds, at 10 cents per pound net	21,400 00
Bacon, 24,000 pounds, at 21 cents per pound	5,040 00
Corn, 61,500 pounds, at 2 cents per pound	1,230 00
Sugar, 9,840 pounds, at 13 cents per pound	1,279 20
Coffee, 4,920 pounds, at 23 cents per pound	1,131 60
Soap, 2,460 pounds, at 8 cents per pound	196 80

In making the above estimate, I have been governed in fixing the cost by the ruling rates in the towns along the Missouri River. I cannot too strongly urge upon the Department the importance of making provisions for the Indians of this agency, commencing with the month of July. All the rations provided for them under contract of last year will have been consumed by that time, and in my judgment if the Department should cease to feed them at this time, the Indians will scatter, many of them joining the disaffected Sioux, who are now committing depredations along the line of the Union Pacific Railroad. The Indians of the upper agencies are constantly taunting the Yanktons with a statement of the fact that they, (the Yanktons,) who are peaceable and friendly to the whites, have never received the presents and provisions from the Government that they, the hostile and unfriendly ones, have. If the Government should feed the Indians of the Whetstone, Cheyenne, Crow Creek, and Grand River agencies during the coming year, and withhold supplies from the Yanktons, it will result in the disintegration of the tribe, and have a strong tendency to alienate the friendly feeling now existing toward the Government. And if perchance there should be an uprising of the Sioux Nation this year, the Yanctons, smarting under what they deem the neglect of the Government, would in all probability join the hostiles. It is of the first importance,

in view of the past and present efforts to advance these Indians in civilization, to pursue a policy that will induce them to remain contentedly on their reservation. If they become scattered and disaffected, in a very short time they will relapse into the same degree of wildness and barbarism that now characterizes their brothers of the Upper Missouri.

In view of these facts I would earnestly invite the attention of the Hon. Commissioner of Indian Affairs to the importance of making ample provision for subsisting the Yankton Indians. According to an estimate of my predecessor, there are about 500 acres of corn and 190 acres of wheat planted on the reservation this year for the Indians. If the crops turn out well, I have no doubt there will be a sufficiency of breadstuff to last them through the winter, and perhaps the spring months; but as the crops are uncertain and cannot be made available until fall it is necessary to make some provision for the interim.

I am, sir, very respectfully, your obedient servant,

J. M. GOODHUE,
Major United States Army, Indian Agent.

Hon. E. S. PARKER,
Commissioner of Indian Affairs, Washington, D. C.

DEPARTMENT OF THE INTERIOR, OFFICE INDIAN AFFAIRS,
June 27, 1870.

SIR: I am in receipt of your letter of the 18th instant, inclosing one from Agent Goodhue, relative to subsistence that will be required for the Yanktons; also of one of same date, transmitting Agent Hearn's report for the month of May, and in which he refers to the matter of subsisting the Indians at the Grand River agency.

In reply I have to advise you that arrangements have been made by this office for the delivery of enough subsistence at the Yankton, Whetstone, Cheyenne, Grand River, and Crow Creek agencies to feed the Indians at those places for three months after the 30th instant. These supplies will be delivered between the 1st and 15th proximo, and you will please advise the respective agents in charge of said agencies accordingly, that they may make the necessary arrangements to receive and care for the stores.

Very respectfully, your obedient servant,

WILLIAM F. CADY,
Acting Commissioner.

Hon. JOHN A. BURBANK,
Governor and ex-officio Superintendent Indian Affairs, Yankton, D. T.

[Telegram.]

SIOUX CITY, IOWA, *June* 18, 1870.

Hon. E. S. PARKER:

The supplies for Indians at Whetstone agency will be entirely expended by July 10, 1870; all the time will be required to forward more. Colonel Sullivan, commissary of subsistence, is prepared to forward them from this point on receipt of orders. Will the order be issued?

D. C. POOLE,
Captain United States Army.

[Telegram.]

DEPARTMENT OF THE INTERIOR, OFFICE OF INDIAN AFFAIRS,
June 18, 1870.

Captain DEWITT C. POOLE, *Indian Agent, Sioux City, Iowa:*

Arrangements have been made for subsistence for Indians at Whetstone. The supplies will probably be there early in July.

E. S. PARKER, *Commissioner.*

SIOUX CITY, IOWA, *June* 18, 1870.

SIR: I am officially informed by Colonel Sullivan, supervising commissary Sioux Indian country, stationed here, that the rations for Indians at Whetstone agency will be

entirely exhausted by the 10th day of July, 1870. As all the time will be required from this date to forward said supplies from this point, the nearest market where they can be procured, I deemed it for the interest of the service to notify you by telegram, that immediate steps may be taken to continue the supplies.

I have the honor to be, with great respect, your obedient servant,

DE WITT C. POOLE,
Captain United States Army and Indian Agent.

Hon. E. S. PARKER,
Commissioner Indian Affairs, Washington, D. C.

DEPARTMENT OF THE INTERIOR, OFFICE OF INDIAN AFFAIRS,
June 18, 1870.

SIR: I have to advise you that arrangements have been made with James W. Bosler, esq., for the delivery of the following subsistence stores for the use of the Indians in your agency, viz:

Two hundred and thirty-four thousand pounds, net weight, of good merchantable beef; the cattle to be delivered on foot as follows: One-third, or thereabouts, on or about the 15th of July; one-third, or thereabouts, on or about the 1st of August; and the residue on or about the 1st of September, 1870. Also, 24,000 pounds of bacon, or dried salt pork; 96,000 pounds of flour; 7,600 pounds of coffee; 15,200 pounds of sugar; 1,920 pounds of salt; 1,920 pounds of soap; and 900 pounds of tobacco. All the articles named are to be of a good merchantable quality, and, with the exception of the beef, are to be delivered at your agency between the 1st and 15th of July next.

You will receive from Mr. Bosler the supplies to be furnished under said arrangement; and should the quantity vary from the amount herein given in each or any case, either more or less, you will receipt to him accordingly; that is, you will give proper receipts for the amount of each article delivered at the time of the delivery. You will, also, make the necessary preparation to properly care for the supplies after they have been delivered.

Very respectfully, your obedient servant,

W. F. CADY,
Acting Commissioner.

Major J. M. GOODHUE,
Indian Agent, Yankton Agency, Dakota Territory.

Captain WILLIAM H. FRENCH,
Indian Agent, Crow Creek Agency, Dakota Territory.

Major G. M. RANDALL,
Indian Agent, Cheyenne Agency, Dakota Territory.

DEPARTMENT OF THE INTERIOR, OFFICE OF INDIAN AFFAIRS,
June 18, 1870.

SIR: I have to advise you that arrangements have been made with James W. Bosler, esq., to furnish the following subsistence stores for the use of the Indians in the Whetstone agency, viz:

Four hundred and sixty-eight thousand pounds, net weight, of good merchantable beef. The cattle are to be delivered on foot, one-third, or thereabouts, to be delivered on or about the 15th of July; one-third, or thereabouts, on or about the 1st of August; and the residue on or about the 1st of September, 1870. Also, 48,000 pounds of bacon, or dried salt pork; 192,000 pounds of flour; 15,200 pounds of coffee; 30,400 pounds of sugar; 3,840 pounds of salt; 3,840 pounds of soap, and 1,800 pounds of tobacco.

All the supplies are to be of a good merchantable quality, and, with the exception of the beef, are to be delivered between the 1st and 15th of July next.

It will probably be impossible for Mr. Bosler to furnish the exact amount agreed upon, and therefore if the quantity of any or all of the articles delivered should vary from the foregoing, either more or less, it will make no particular difference.

You will give Mr. Bosler proper receipts for all the supplies furnished by him at the time of the delivery.

Very respectfully, your obedient servant,

W. F. CADY,
Acting Commissioner.

Captain D. W. C. POOLE,
Indian Agent, Whetstone Agency, Dakotah Territory.

DEPARTMENT OF THE INTERIOR, OFFICE OF INDIAN AFFAIRS,
June 18, 1870.

SIR: I have to advise you that arrangements have been made with James W. Bosler, esq., to furnish the following subsistence supplies for the use of the Indians on the Grand River reservation, Dakota Territory, viz:

Five hundred and eighty-five thousand pounds, net weight, of good merchantable beef. The cattle are to be delivered on foot, one-third, or thereabouts, to be delivered on or about the the 15th of July; one-third on or about the 1st of August; and the residue on or about the 1st day of September, 1870. Also, 60,000 pounds of bacon, or dried salt pork; 202,500 pounds flour; 18,000 pounds of coffee; 36,000 pounds of sugar; 4,500 pounds of salt; 4,500 pounds of soap, and 2,250 pounds of tobacco.

All the supplies are to be of a good merchantable quality, and, with the exception of the beef, are to be delivered between the 1st and 15th of July next.

You will give Mr. Bosler proper receipts for all the supplies furnished by him, at the time of delivery; and as it will probably be impossible for him to furnish the exact amount agreed upon, it will make no particular difference if the quantity of any or all of the articles delivered should vary either more or less from the foregoing.

Very respectfully, your obedient servant,

W. F. CADY,
Acting Commissioner.

Major JAS. A. HEARN,
Indian Agent, Grand River Agency, Dakota Territory.

[Telegram.—Received at 1.53 p. m.]

SIOUX CITY, *June* 22, 1870.

General E. S. PARKER, *Commissioner Indian Affairs:*

I have enough cattle on hand to last three months. Will the Commissary Department furnish the other supplies? Your answer to this will guide me in closing up my papers with that Department.

D. C. POOLE,
Captain U. S. Army.

[Telegram.]

DEPARTMENT OF THE INTERIOR, OFFICE OF INDIAN AFFAIRS,
June 22, 1870.

Captain D. W. C. POOLE, *Indian Agent, Sioux City, Iowa:*

The Subsistence Department will furnish no supplies after 1st proximo. Other arrangements have been made.

E. S. PARKER, *Commissioner.*

DEPARTMENT OF THE INTERIOR, OFFICE OF INDIAN AFFAIRS,
June 23, 1870.

SIR: I have to advise you that I am in receipt of a telegram from Agent Poole, dated the 22d instant, to the effect that he has enough cattle at the Whetstone agency to last three months.

In view of this fact, the beef stipulated to be delivered at that agency by the terms of your contract, made with this Bureau on the 17th instant, will not be required, and need not be furnished by you.

Very respectfully, your obedient servant,

WM. F. CADY,
Acting Commissioner.

JAMES W. BOSLER, Esq.,
Sioux City, Iowa.

[Telegram—Received at 12.45 a. m.]

SIOUX CITY, IOWA, *July* 3, 1870.

Hon. E. S. PARKER, *Commissioner Indian Affairs, Washington:*

The cattle for Whetstone are on the way there, and will be ready for delivery in a few days. I can't have them left on my hands. I sent up enough for two months, and you should take them. Only received letter to-day—nearly the time for delivery.

J. W. BOSLER.

SIOUX CITY, *July* 4, 1870.

DEAR SIR: Your favor directing me not to deliver the cattle contracted for at Whetstone was only received to-day. The cattle for Whetstone were purchased some eight days ago, and are now nearly at Whetstone; and to abandon the delivery and drive them back would be great detriment and loss to me. You must recollect that your desire and instructions were to hurry these cattle forward and deliver them without delay, which I did. I purchased the entire amount of cattle called for under the contract, and started them from a point on the Union Pacific Railroad for the several agencies, and I will be unable to communicate with them until they strike the Missouri River, which will be near Whetstone. So, under the circumstances, and taking into consideration the great embarrassment it would be to me to carry out your instructions, I hope you will reconsider the matter and instruct the agent to receive them. I have used every exertion possible to carry out your wishes in this matter as to time, and should not be the sufferer for doing so; besides, I learned from Colonel Macfeely, at Chicago, that Major Poole had received notice at Chicago that you had made arrangements to supply his agency with cattle and other subsistence immediately, and I therefore think that he had no right to supply himself to such an extent, and should have to take care of them.

Let me hear from you at once on this subject, directed to this place. Governor Burbank wished me to leave part of the supplies for Yankton agency at Ponca agency. I telegraphed you on the subject, but did not receive an answer, and as the boat containing these supplies has left, there will be none left at Ponca agency. I will leave to-morrow to overtake the boats, but a letter will reach me at this place.

Very respectfully, yours, &c.,

J. W. BOSLER.

General E. S. PARKER.

EXECUTIVE OFFICE,
Yankton, Dakota Territory, June 30, 1870.

SIR: Herewith inclosed I have the honor to transmit letter of Captain W. Clifford, of Fort Berthold agency, relative to the stores needed for the subsistence of Indians at that place during the coming winter, a large number of them consisting of women and children, who have to look exclusively to the Government for support. It is quite important that these stores should be sent in ample time to insure their delivery before the close of navigation, and also that they should be sent to Fort Berthold *direct*, instead of to Fort Stevenson, from whence they would have to be hauled, if landed there.

Very respectfully, your obedient servant,

JOHN A. BURBANK,
Governor and ex-officio Superintendent Indian Affairs.

UPPER MISSOURI INDIAN AGENCY,
Fort Berthold, Dakota Territory, June 16, 1870.

GOVERNOR: I have the honor to submit that the following subsistence stores should be furnished this agency for the use of Indians here who may not be able to get away from the village in pursuit of game this winter, which inability may arise from various reasons, as sickness, want of means of transportaion, &c., viz: 500,000 pounds of flour; 75,000 pounds of bacon; 150,000 pounds of fresh beef; 10,000 pounds of sugar; 5,000 pounds of coffee. There are between five and seven hundred women and children, who have no relations, and of course are entirely dependent upon the agency for subsistence. In case of the failure of game this estimate will not be large enough, but if game is no scarcer than it was last winter, this amount will be sufficient. If no subsistence stores are sent, and game fails, these people will be in a most deplorable condition, as they will starve by degrees. Nothing can be told as to the certainty or uncertainty of the crop, and even if it turns out first class, there will not be sufficient to avert starvation.

I am thus early in forwarding this application for the reason that I consider these people entitled to just as much as whites under charge of the Government, and certainly to more than the Sioux, who repaid the kindness of the Government with treachery.

Any stores forwarded to this agency should be sent to Fort Berthold, Dakota Territory, as the cost of hauling from Stevenson will amount from one-half to one cent per pound.

As yet there are no provisions at Stevenson for the people, and the little at that post last winter was all that kept famine at bay.

I am, sir, very respectfully, your obedient servant,

W. CLIFFORD,
Captain United States Army, Indian Agent.

Hon. J. A. BURBANK,
Governor and ex-officio Superintendent Indian Affairs, Yankton, D. T.

[Telegram.—Received at corner Penn. avenue and Fourteenth street 12.15 p. m.]

SIOUX CITY, IOWA, *July* 3, 1870.

To Hon. E. S. PARKER, *Commissioner Indian Affairs*:

The Indians of Fort Berthold agency are in as much need of subsistence as any in my superintendency. A full report is on the way. The beef cattle you ordered for Whetstone agency have been purchased and now en route to the agency. I have to recommend that I be authorized to order J. W. Bosler to deliver the same to Captain W. Clifford without delay.

JOHN A. BURBANK,
Governor and ex-officio Superintendent Indian Affairs.

[Telegram.]

DEPARTMENT OF THE INTERIOR, OFFICE OF INDIAN AFFAIRS,
July 5, 1870.

J. W. BOSLER, Esq., *Sioux City, Iowa:*

Leave part of Yankton supplies at Ponca agency, agreeably to Governor Burbank's order. Agent's receipt will be sufficient. Can you deliver at Berthold the beef intended for Whetstone? Answer.

W. F. CADY,
Acting Commissioner.

[Telegram.]

SIOUX CITY, IOWA, *July* 5, 1870.

Hon. E. S. PARKER, *Commissioner:*

It will be impossible for me to deliver those cattle at Berthold; it is through the most dangerous Indian country from Grand River up, and I cannot get men to do it. Receive them at Whetstone, and let the Government transport them either by river or with a military escort. I might deliver them at Grand River agency by prepaying the extra cost of driving, and let your Berthold agent come down and receive them there. I will be unable to communicate with them until they strike the Missouri River at Whetstone. Wait until you receive my letter, then answer here. All stores have gone. I leave to-night; am afraid the boat with Yankton supplies had passed Ponca before I received your telegram.

J. W. BOSLER.

DEPARTMENT OF THE INTERIOR, OFFICE INDIAN AFFAIRS,
July 9, 1870.

SIR: In reply to your letter of the 4th instant relative to the delivery of beef cattle at the Whetstone agency for the use of the Indians at that place, I have to say, that the cattle you have forwarded for said agency will be received by Agent Poole, and that, as no instructions have been sent to the agent in regard to the matter, except those contained in office letter of the 18th ultimo, which letter was handed to you for delivery to him, it is deemed unnecessary to issue further instructions in the premises.

Very respectfully, your obedient servant,

E. S. PARKER,
Commissioner.

JAS. W. BOSLER, Esq.,
Sioux City, Iowa.

EXECUTIVE OFFICE, YANCTON, DAKOTA TERRITORY,
July 15, 1870.

SIR: I have the honor to inclose herewith a letter from Captain D. C. Poole, Indian agent at the Whetstone agency, dated July 10, relative to the matter of receiving from J. W. Bosler the beef cattle purchased for the use of the Yankton Sioux Indians and requesting that on account of the scarcity of grass near the agency, and the liability of losing the cattle in the adjoining hilly country, he be allowed to herd them on the Yankton reservation. Touching that portion of the agent's letter which relates to the matter of receiving the cattle from the contractor, I would say that Agent Poole

has been directed to follow out the instructions contained in your letter to Mr. Bosler, the contractor.

The bottom lands of the Yankton reservation contain good grass, and are well adapted to the herding of cattle, but as the Yankton Indians will doubtless be opposed to having the Government cattle on these lands, I would suggest that the agent be directed to first make some agreeable arrangement with them, in council, for this purpose, or to move them to other vacant lands, if suitable ones can be found.

Very respectfully, your obedient servant,

JOHN A. BURBANK,
Governor and ex-officio Superintendent of Indian Affairs.

Hon. E. S. PARKER,
Commissioner of Indian Affairs, Washington, D. C.

WHETSTONE AGENCY, DAKOTA TERRITORY,
July 10, 1870.

SIR: I have the honor to report that supplies, intended for three months' issue, have been received from Mr. Bosler. Some of the flour is not of good quality. I am having the same inspected, and shall reject such as I consider unfit for issue to Indians. Mr. Bosler informs me that he will have at this agency, on or about the 20th inst., near one thousand head of cattle. As I have on hand nearly three months' supply, I have informed him that I could not receipt for the same unless I receive positive orders to do so from the Indian Department.

I have to respectfully recommend the herding of surplus cattle at some other point, on account of the drought here, and consequent drying up of grass. A point at or near Yancton agency would be much the most desirable also. Large herds upon the west side of the river (Missouri) are liable to be stampeded, and many of them lost in broken and hilly country. I have, therefore, to respectfully request that orders to receive said cattle be not issued.

Very respectfully, your obedient servant,

DEWITT C. POOLE,
Captain United States Army and Indian Agent.

Hon. JOHN A. BURBANK,
Governor and ex-officio Superintendent Indian Affairs, Yankton, D. T.

CHEYENNE AGENCY, *July* 10, 1870.

DEAR SIR: I have delivered all the subsistence stores, under my contract, except Grand River agency, and will complete the delivery there in a few days. In the matter of the cattle for the Whetstone agency, on which subject I both wrote and telegraphed you before leaving Sioux City, if you have not already sent it, I shall expect to find an order at Sioux City for Captain Poole to receive the Whetstone cattle, as per contract, and would also like to have you add to the order that he shall receive them all at one delivery, not to be later than the 15th of August. All the other agents have kindly and willingly agreed to receive them all at once, and Captain Poole said that he could take care of them, and would do so, if he was so instructed, but that in consideration of the notice he had given the Indian Department of his having three months' supply, he should require additional instructions before he would receive them. I hope, therefore, that if you have not already sent these instructions, you will do so at once, by telegraph to Sioux City, in order that I may receive them upon my return to Sioux City.

I will also call your attention to the fact, that up to the time I left Sioux City, I had not received the order for a military escort from Fort Sully to Grand River.

I hope you will give this your immediate attention, as the cattle for Whetstone agency will be ready for delivery before this reaches you, and will probably be delivered at Yancton agency and Crow Creek. I found all the agencies, except Cheyenne, nearly out of stores. At Whetstone they were entirely out, and had borrowed an issue from Fort Randall.

Very respectfully,

J. W. BOSLER.

HON. E. S. PARKER,
Commissioner of Indian Affairs Washington, D. C.

DEPARTMENT OF THE INTERIOR, OFFICE OF INDIAN AFFAIRS,
Washington, D. C., July 18, 1870.

SIR: I am in receipt of your letter of the 10th instant, relative to the delivery of beef cattle at the Whetstone agency.

In reply thereto I have to refer you to office letter of the 9th instant, and would state in addition thereto, that in case Agent Poole declines to receive the cattle to be delivered at his agency under your contract with this bureau, he is authorized and instructed, on your presentation of this letter, to receive the same, and, if he can take proper care of them, to receive at one time all the cattle to be delivered by you at his agency.

Very respectfully, your obedient servant,

E. S. PARKER, *Commissioner.*

JAS. W. BOSLER, Esq.,
Sioux City, Iowa.

[Telegram.—Received at corner Pennsylvania avenue and 14th st. 11.25 a. m., via Missouri Valley.]

SIOUX CITY, IOWA, *July* 19, 1870.

To Hon. E. S. PARKER, *Commissioner:*

Goods all delivered. Agencies all agreed to receive the cattle as fast as I choose to deliver, except Poole's, but wants instructions to protect them. Will you send instructions by telegraph to my care at this place, and I will send up by messenger. Poole is absent and his representative will only follow strictly letter of instructions. Instruct here to receive them at once. Cattle all there, ready for delivery, and for all the other posts; are ready for Grand River. I have instructions.

J. W. BOSLER.

[Telegram.]

DEPARTMENT OF THE INTERIOR, OFFICE OF INDIAN AFFAIRS,
July 20, 1870.

Captain W. H. FRENCH, jr., Major J. A. HEARN, Major G. M. RANDALL, Major J. M. GOODHUE, Captain DE WITT C. POOLE, *Indian Agents*, care of J. W. Bosler, esq., *Sioux City, Iowa:*

Receive from Mr. Bosler, when he is ready to deliver them, all the cattle to be furnished by him for your respective agencies. Employ necessary herders to care for cattle.

E. S. PARKER, *Commissioner.*

Charge Office Indian Affairs.

E. S. PARKER, *Commissioner.*

DEPARTMENT OF THE INTERIOR, OFFICE OF INDIAN AFFAIRS,
Washington, D. C., July 23, 1870.

SIR: I am in receipt of your letter of the 15th instant, inclosing one from Agent Poole, relative to receiving and herding the cattle to be furnished by J. W. Bosler, under his contract for the Indians at the Whetstone agency, stating that you have directed the agent to carry out the instructions of this Department in regard to receiving said cattle, and suggesting that some arrangement be made with the Yanctons by which the cattle can be herded on their reservation, or that they be moved to other vacant lands if suitable ones can be found.

In reply, I have to say that it is expected the agent will at all times obey the instructions of this Department, and consequently that the cattle will be received by him in accordance with instructions. Regarding the question of herding the surplus cattle, I would say that your suggestion meets with the approval of this office, and you will please give the necessary instructions in the premises to have the same carried out. It is desired, however, to have the cattle in question herded on vacant lands, unless the Yanktons are willing to have them on their reservation without extra expense to the Government.

Very respectfully, your obedient servant,

W. F. CADY, *Acting Commissioner.*

Hon. JOHN A. BURBANK,
Governor, &c., Yancton, D. T.

DEPARTMENT OF THE INTERIOR, OFFICE OF INDIAN AFFAIRS,
August 13, 1870.

SIR: This office is about advertising for proposals for subsistence supplies for Indians at the Yankton, Whetstone, Crow Creek, Cheyenne, and Grand River agencies, Dakota

Territory, and I respectfully request that authority be granted to publish such advertisement in the following named newspapers, viz: Chicago Tribune, Chicago Republican, Sioux City Daily Times, Omaha Republican, and Leavenworth Times, together with such other papers as you may deem advisable.

Very respectfully, your obedient servant,

W. F. CADY, *Acting Commissioner.*

Hon. J. D. Cox,
Secretary of the Interior.

DEPARTMENT OF THE INTERIOR,
Washington, D. C., August 16, 1870.

SIR: You are hereby authorized, in compliance with your recommendation, to advertise proposals for subsistence supplies for Indians at the Yankton, Whetstone, Crow Creek, Cheyenne, and Grand River agencies, Dakota Territory, in the newspapers named in your letter of the 13th instant.

Very respectfully, your obedient servant,

J. D. COX, *Secretary.*

The ACTING COMMISSIONER *of Indian Affairs.*

DEPARTMENT OF THE INTERIOR, OFFICE INDIAN AFFAIRS,
August 10, 1870.

SIR: It being exceedingly doubtful whether, under any advertisement for supplying the Sioux of Dakota with beef and flour, they can be furnished in proper season to prevent a deficiency, I have to request that you will at once supply 1,500,000 pounds, net, more of beef, to be distributed at the various agencies on the Missouri River, in such amounts as shall be hereafter designated to you. Said beef will be paid for at the same rates per pound as is provided in your contract with the Indian Bureau, dated June 17, 1870. This beef must all be on the hoof, and of as good quality as was furnished under your contract, and must all be delivered at the several agencies on the Missouri River on or before the 15th day of October, 1870.

You will also be pleased to collect for the Indian Bureau, for the use of the Sioux Indians of Dakota, from 2,000,000 to 3,000,000 pounds of good extra wheat flour, to be delivered in Sioux City, at as low rates as possible, which rates should not exceed 3½ cents per pound when delivered in Sioux City, ready for shipment by boat.

Your accounts for beef will be settled in Washington, D. C., upon your presenting the receipts of the amounts received by the respective agents, who have this day been instructed to receive from you and receipt to you for the beef you may furnish under this order.

The flour will be settled for in Washington, D. C., upon your presenting bills of lading from such transportation companies as may transport the same to the several agencies.

Very respectfully, your obedient servant,

E. S. PARKER,
Commissioner.

J. W. BOSLER, Esq.,
Sioux City, Iowa.

DEPARTMENT OF THE INTERIOR, OFFICE OF INDIAN AFFAIRS,
August 10, 1870.

SIR: Under special arrangement, J. W. Bosler, esq., has been directed to supply your agency with about 430,000 pounds, gross weight, of beef on the hoof. You will please receive and receipt to him for the same as they may be delivered.

Your obedient servant,

E. S. PARKER,
Commissioner.

UNITED STATES INDIAN AGENT,
At the Crow Creek Sioux Indian Agency, Dakota.

Similar letters to the above sent to the agents at Cheyenne agency, for 430,000 pounds; Yankton agency, for 430,000 pounds; Grand River agency, for 1,075,000 pounds; Whetstone agency, for 645,000 pounds.

CHEYENNE AGENCY, DAKOTA TERRITORY,
August 20, 1870.

SIR: I have the honor to state that I have taken an inventory of the subsistence stores received at the agency during the month of July, 1870, and found the weights

to be as follows, viz: 22,344 pounds bacon, 94,080 pounds flour, 6,335 pounds coffee, 15,182 pounds sugar, 1,920 pounds soap, 1,680 pounds salt, 900 pounds tobacco, 210,150 pounds beef.

The beef cattle were received on the east side of the river, when the instructions stated that the cattle, as well as the stores, were to be delivered and received at the agency. The result has been very disastrous to the Indians. The cattle "stampeded," and out of 450 head received by Dr. Roberts, 80 head are still missing. All the cattle that were to be found have been placed on the west side of the river below the agency. I have used every effort to find and recover the missing cattle, but thus far have not been successful. I shall take up the subsistence at the weights according to the inventory taken. No invoices were received from the contractor, and therefore I am unable to ascertain what amounts were received and receipted for. All the papers I have to show are the steamboats' bills of lading, which will not answer my purpose.

If the memorandum receipts given by Dr. Lorenzo H. Roberts have not been paid, I must respectfully request that they be withheld, and I be directed to furnish correct vouchers.

I may add that the beef cattle were received by Dr. Roberts at an average of 1,200 pounds gross per head. I put 34 head (an average lot of said cattle) upon the agency scales this day, and their actual weight was 934 pounds gross per head.

I am, sir, very respectfully, your obedient servant,

GEORGE M. RANDALL,
Captain United States Army, Indian Agent.

Hon. E. S. PARKER,
Commissioner of Indian Affairs.

CHEYENNE AGENCY, DAKOTA TERRITORY,
August 21, 1870.

SIR: I desire to call your attention to the report of Major G. M. Randall, dated 20th August, from this place. I was not aware of Major Randall's report until just before the mail was to leave; hence I write hurriedly and brief. The Hon. J. A. Burbank, governor and ex-officio superintendent of Indian affairs, sent up Mr. Allison from his office to see that the stores were properly delivered; and I received them and receipted for them in Mr. Allison's presence, but confess I erred in not keeping a copy of the receipt I gave Mr. Bosler, which at the time did not occur to me. I have since, however, written Mr. Bosler for a copy of the receipt, and trust in due time it will come to hand. My reason for receiving the cattle on the east side of the river opposite the agency was in consequence of what Major Randall had said about Indians killing them on the west side. I took the advice of the commanding officer at this post, together with Mr. Allison's. It would have convenienced Mr. Bosler to deliver them at the agency. After Major Randall's return from Washington, I was told that sixty head of cattle had stampeded and had gone into the quartermaster's herd at Fort Sully, and Major Randall told me he found them there, but did not send for them until last Friday, and got only twenty-eight head, I believe. At the time I received the cattle, the agency scales were torn up, and, having no opportunity for weighing them, I went to Fort Sully and found an officer who had judged the weight of cattle often, who was an officer of the day. I went to General Crittenden, commanding; stated to him that I desired Captain J. B. Irvine, who was the officer of the day, to go with me to help judge the weight of the cattle. General Crittenden had him relieved from duty, and we, together with Mr. Joseph Bosler, proceeded to judge the cattle, which we took at six hundred pounds net, and I still believe they will net that amount, although we may have erred in our judgment. It was with great reluctance that I consented to act for Major Randall in his absence, and I would most respectfully ask the honorable Commissioner to inquire of the commanding officer at Cheyenne, (Brevet Lieutenant Colonel E. P. Pearsons,) or any other officer here or at Fort Sully, as to my faithfulness of duty for Major Randall while he was absent in Washington on business. I will not here state why, in my opinion, Major Randall ignores my actions, but will refer you to General Crittenden, Captain Irvine, or the commanding officer at this place.

Trusting I may be treated fairly in the premises, I am, sir, very respectfully, your obedient servant,

L. H. ROBERTS,
Physician, Cheyenne Agency.

Hon. E. S. PARKER,
Commissioner of Indian Affairs, Washington, D. C.

NEW YORK, *August* 25, 1870.

DEAR SIR: I return herewith the advertisement for supplies for Sioux Indians, corrected. You will please have fair copies made, and have the same published in the

ollowing papers: Chronicle and Republican, Washington, two papers in Chicago, one paper in Leavenworth, one paper in Omaha, and one paper in Sioux City.

Very respectfully, your obedient servant,

E. S. PARKER,
Commissioner.

DR. W. F. CADY,
Acting Commissioner Indian Affairs, Washington, D. C.

SUPPLIES FOR INDIANS

DEPARTMENT OF INTERIOR, OFFICE OF INDIAN AFFAIRS,
Washington, D. C., August 26, 1870.

Sealed proposals, in duplicate, will be received at this office until 12 o'clock m., of Monday, September 5, 1870, for the following-named articles required for issue to Indians at the Yankton, Whetstone, Crow, Creek, Cheyenne, and Grand River agencies, in Dakota Territory, viz:

At the Yankton, Crow, Creek, and Cheyenne agencies, respectively, 1,000,000 pounds gross weight, of beef cattle, on the hoof; 70,000 pounds of bacon, clear sides.

At the Whetstone agency, 1,440,000 pounds, gross weight, of beef cattle, on the hoof; 140,000 pounds of bacon, clear sides.

At the Grand River agency, 2,700,000 pounds, gross weight, of beef cattle, on the hoof; 180,000 pounds of bacon, clear sides.

The beef cattle must be good, merchantable cattle, all steers, in good, healthy condition, and average at least one thousand pounds each, live weight, the weight to be determined by weighing on scales when practicable. Their delivery must commence at each of the points named, with the exception of the Whetstone agency, between the 1st and 15th of October next, at which time about one-ninth ($\frac{1}{9}$) of the whole quantity will be delivered; and thereafter the delivery will be made monthly in such quantity as the respective agents shall require. At the Whetstone agency about one-sixth ($\frac{1}{6}$) of the whole quantity to be furnished for that place must be delivered on or before the 1st of January, 1871, and thereafter monthly as at the other agencies.

That there may be no failure on the part of the contractor, he will be required to keep the beef cattle in the vicinity of the respective agencies, to be delivered when required by the agents; and should it be ascertained that he is not collecting cattle in the vicinity of said agencies fast enough, or should he fail to turn them in to the agents as called for, the undersigned will purchase, or cause to be purchased, beef cattle, as he may elect, at the expense of said contractor.

The bacon must be sound and sweet, and will be delivered at Chicago, Illinois, on or before the 20th of September next, and be subject to inspection by an agent to be appointed for that purpose.

Proposals will be received for the delivery of all or any part of the above-named supplies.

The undersigned reserves the right to increase or diminish the quantity of each or any of the articles which the contractor or contractors agree to furnish, provided that the increase in no case shall exceed twenty-five (25) per cent.

Payments will be made at this office on presentation of proper receipts from the agents to whom the supplies are delivered.

Bids for beef cattle will state price per pound, gross. The proposals for the bacon should state the price per pound, net.

Each copy of each proposal must have a copy of this advertisement (a slip from a newspaper) pasted at its head.

No bid will be considered unless accompanied by a written guarantee of two responsible parties, (not bidders,) to the effect that, if the bid is accepted, the bidder will immediately enter into a written contract in accordance therewith, and that they will become sureties on his bond.

The right is reserved to reject any or all proposals, if such a course should be deemed for the interests of the Government.

Each bidder must designate his place of business, where communications sent to him will be received, the same to be entered in his contract should one be awarded to him.

Proposals should be inclosed in an envelope addressed to the undersigned, and indorsed "Proposals for Supplies for Indians."

Bidders are invited to be present at the opening of the bids.

E. S. PARKER,
Commissioner.

NOTICE.—The time for receiving proposals under the above advertisement is extended to the 12th instant at 12 m.

ELY S. PARKER,
Commissioner.

* Offers to furnish all the beef at 4 16-100.

DEPARTMENT OF THE INTERIOR, OFFICE INDIAN AFFAIRS,
September 5, 1870.

SIR: The receiving and opening of the bids to be received under my advertisement for supplying the Sioux of Dakota with beef and bacon, having been postponed one week, and fearing serious results from the Indians should their supply of subsistence become exhausted, I have to urge that you will not delay in pushing forward the cattle ordered by me in my communication of the 10th of August. It is extremely important that the upper agencies should be reached at as early a date as possible, so that the Indians may not want for subsistence. The successful bidder in the letting soon to come off may be delayed in the execution of his contract, and it is to guard against such a contingency that I requested you to supply the Indian Department a certain amount of cattle on the hoof, and I hope that you will not disappoint the Department.

Your obedient servant,

E. S. PARKER,
Commissioner.

J. W. BOSLER, ESQ.,
Sioux City, Iowa.

[Telegram.s]

DEPARTMENT OF THE INTERIOR, OFFICE OF INDIAN AFFAIRS,
Washington, D. C., September 14, 1870.

Your bid for bacon, eighteen cents, has been accepted. I can be in Chicago any day next week to inspect and receive the same. Answer.

E. S. PARKER,
Commissioner.

J. W. BOSLER, Esq.,
Sioux City, Iowa.

DEPARTMENT OF THE INTERIOR, OFFICE OF INDIAN AFFAIRS,
Washington, D. C., September 15, 1870.

Your bid for beef at three eighty-eight accepted. Will exact bond for one hundred and fifty thousand dollars. When will you execute contract and give the required bond? Answer.

W. F. CADY,
Acting Commissioner.

J. A. MORROW, Esq.,
Omaha, Nebraska.

DEPARTMENT OF THE INTERIOR, OFFICE OF INDIAN AFFAIRS,
Washington, D. C., September 15, 1870.

James F. Gibbs declines his bid for furnishing beef, being unable to furnish required bond.

W. F. CADY,
Acting Commissioner.

Hon. E. S. PARKER,
Commissioner of Indian Affairs, care of Buckley, Welling & Co.,
380 and 382 Broadway, New York City.

EXECUTIVE OFFICE,
Yankton, Dakota Territory, September 8, 1870.

SIR: I have the honor to transmit herewith report of Captain DeWitt C. Poole on the condition of affairs at Whetstone agency for the month of August, 1870.

I have to direct special attention to that portion of the report which has reference to the increase in the ration, in accordance with what is claimed by Spotted Tail and Swift Bear to have been a promise made to them while in Washington.

Very respectfully, your obedient servant,

JOHN A. BURBANK,
Governor and ex-officio Superintendent Indian Affairs.

HON. E. S. PARKER,
Commissioner of Indian Affairs, Washington, D. C.

WHETSTONE AGENCY,
Dakota Territory, September 5, 1870.

SIR: I have the honor to report upon the condition of affairs at this agency during the month ending August 31, 1870.

Two companies of the Fourteenth Infantry stationed here have been removed to the Department of the Platte, and one company of the Twenty-seccond Infantry, from Fort Randall, has taken their place. The Indians remain comparatively quiet and are anxiously awaiting the arrival of annuity goods, which they have been informed will arrive by the 15th of September, predicated upon telegram received from the Commissioner of Indian Affairs that such would be the case.

The cattle received from the Commissary Department still amount to over six hundred and forty head, and those received from Mr. Bosler to about eight hundred head. In consequence of the severe drought prevailing in this vicinity good grass for grazing is very scarce. I have found it absolutely necessary to keep the two herds separate, and they are still too large to be united. I have to keep these two herds some twenty-five miles from the agency, and are at present located upon and near Ponca Creek, a branch of the Niobrara River. I returned from a visit to these herds a few days since, and found them in good condition; plenty of running water, although the cattle have to be allowed a wide range to procure sufficient grass. It is my intention to discharge one set of herders by the end of September 30th, and thus reduce very materially expenses.

Spotted Tail and Swift Bear complain very much on account of the ration not being increased. They say that while in Washington they were promised such increase, and that they informed their people upon their return that such would be the case. Their people now accuse them of misrepresenting. I have received no instructions to increase the component parts of the ration, and have no means of doing so. The present supply will be consumed by the 30th of September, excepting beef.

Many of the Indians will move back into the country upon receipt of annuity goods, they inform me, instigated by the whites intermarried with them, who design moving back near Fort Laramie, learning that trading posts and an agency are to be established near there for Red Cloud and his people. The funds required to pay off employés and

herders, and other indebtedness of the agency, it is hoped will be promptly furnished, that all accounts may be adjusted at end of present quarter.

Very respectfully, your obedient servant,

DEWITT C. POOLE,
Captain United States Army and Indian Agent.

Hon. JOHN A. BURBANK,
Ex-officio Superintendent Indian Affairs, Yankton, D. T.

Articles of agreement made and entered into this 17th day of June, A. D. 1870, by and between E. S. Parker, Commissioner of Indian Affairs, for and on behalf of the United States of the first part, and James W. Bosler, of Carlisle, Pennsylvania, of the second part, witnesseth: That the said parties have agreed and do hereby covenant and agree to and with each other in the manner following, to wit:

The said James W. Bosler agrees to furnish and deliver the following described subsistence stores, for the use of the Indians, at the places hereinafter mentioned, in the quantities and at the prices hereinafter specified, to wit:

To the agent of the Yankton Sioux Indians, at their reservation in Dakota Territory, the following supplies, viz: 234,000 pounds of beef, net, 24,000 pounds of bacon or dried salt pork, 96,000 pounds of flour, 7,600 pounds of coffee, 15,200 pounds of sugar, 1,920 pounds of salt, 1,920 pounds soap, 900 pounds of tobacco.

To the agent in charge of the Indians at the Crow Creek agency, Dakota Territory, the same quantity of each article as that agreed to be delivered at the Yankton reservation.

To the agent in charge of the Indians at the Cheyenne agency, Dakota Territory, the same as at the Yankton reservation.

To the agent in charge of the Indians at the Whetstone agency, Dakota Territory, the following, viz: 468,000 pounds of beef, net, 48,000 pounds of bacon or dried salt pork, 192,000 pounds of flour, 15,200 pounds of coffee, 28,800 pounds of sugar, 3,840 pounds of salt, 3,840 pounds of soap, 1,800 pounds of tobacco.

To the agent in charge of the Indians at the Grand River agency, Dakota Territory, the following, viz: 585,000 pounds of beef, net, 60,000 pounds of bacon or dried salt pork, 202,500 pounds of flour, 18,000 pounds of coffee, 36,000 pounds of sugar, 4,500 pounds of salt, 4,500 pounds of soap, 2,250 pounds of tobacco.

The beef is to be of good, merchantable quality, and to be delivered on foot; one-third, or thereabouts, to be delivered on or about the 15th of July; one-third on or about August 1, and the residue on or about the 1st of September, 1870.

The flour is to be of number one spring wheat, in accordance with the sample in the office of the Commissioner of Indian Affairs, Washington, D. C.

All the articles herein named, with the exception of the beef, are to be delivered at the respective agencies, between the 1st and 15th of July, 1870, and are to be of a good merchantable quality.

In consideration of the faithful performance of this agreement on the part of the party of the second part, he shall be paid at the office of the Commissioner of Indian Affairs, Washington, D. C., on presentation of the receipts of the respective agents, the following prices, to wit:

For all beef furnished by him and received by said agents he shall be paid at the rate of six and a half cents (6½c.) per pound gross; for bacon, twenty-five cents (25c.) per pound; for flour, six and a half cents (6½c.) per pound; for coffee, twenty-eight cents (28c.) per pound; for sugar, eighteen cents (18c.) per pound; for salt, eight cents (8c.) per pound; for soap, fifteen cents (15c.) per pound; and for tobacco, eighty-five cents (85c.) per pound.

In witness whereof the parties hereto have hereunto set their hands and seals.

[SEAL.] E. S. PARKER,
Commissioner of Indian Affairs.
[SEAL.] JAMES W. BOSLER.

Signed in presence of—
W. F. CADY.
H. R. CLUM.

Articles of agreement made and entered into at Washington, District of Columbia, this 17th day of September, 1870, between W. F. Cady, Acting Commissioner of Indian Affairs, for and on behalf of the United States of America, of the first part, and J. A. Morrow, of the city of Omaha, State of Nebraska, of the second part:

This agreement witnesseth, that the said party of the first part, for and in behalf of the United States of America, and the said party of the second part, for himself, his

heirs, executors, and administrators, have mutually agreed, and by these presents do mutually covenant and agree, to and with each other as follows, viz:

First. That the said J. A. Morrow, or his heirs, executors, and administrators, shall furnish the Indian Bureau for issue to Indians seven millions one hundred and forty thousand pounds, gross weight, of fresh beef, to be delivered on the hoof, in quantities and at the places hereinafter named.

At the Yankton agency, Dakota Territory, one million pounds, gross weight, to be delivered as follows: about one-ninth of the whole quantity between the 1st and 15th of October, 1870, and thereafter the delivery to be made monthly in such quantity as the Indian agent at said agency shall require.

At the Crow Creek agency, Dakota Territory, the same quantity as at the Yankton agency, and to be delivered in the same manner.

At Cheyenne agency, Dakota Territory, the same quantity as at the Yankton, and in the same manner.

At the Whetstone agency, Dakota Territory, one million four hundred and forty thousand pounds, gross weight, to be delivered as follows: about one-sixth of the whole quantity on or about the 1st day of January, 1871, and thereafter monthly, as at the Yancton agency.

At the Grand River agency, Dakota Territory, two millions seven hundred thousand pounds, gross weight, to be delivered in the same manner as at the Yankton agency.

Second. All the beef cattle furnished under this contract are to be good merchantable cattle, all steers, in good healthy condition, and to average at least one thousand pounds live weight—the weight to be determined by weighing on scales, when practicable.

Third. The said J. A. Morrow shall receive three cents and eighty-eight one hundredths of a cent per pound gross weight for all the beef accepted under this contract.

Fourth. The said party of the first part, for and in behalf of the United States, agrees that payment as aforesaid shall be made, for the beef accepted under this contract, in United States currency, on presentation at the office of Indian Affairs of the receipts of the Indian agents to whom the beef is delivered.

Fifth. The party of the second part further agrees to keep a sufficient number of beef cattle in the vicinity of the respective agencies, to avoid the possibility of any failure on his part to deliver the beef when required by the agents; and should it be ascertained that he is not collecting cattle in the vicinity of said agencies fast enough, or should he fail to deliver them to any agent or agents as called for, the party of the first part shall have the right to purchase, or cause to be purchased, beef cattle as he may elect, at the expense of the party of the second part, who shall be charged with the difference of the cost of the beef so purchased.

Sixth. It is mutually agreed that the party of the first part shall have the right to increase or diminish the quantity of beef to be delivered at any or all of said agencies, provided that the increase shall in no case exceed twenty-five (25) per cent. of the quantity herein agreed to be furnished.

Seventh. No member of Congress, officer, or agent of the Government, or any person employed in the public service, shall be admitted to any share herein, or to any benefit that may arise therefrom.

In witness whereof the undersigned have hereto placed their hands and seals the day and year first above mentioned.

[SEAL.]

W. F. CADY,
Acting Commissioner Indian Affairs.
J. A. MORROW.

Articles of agreement, made and entered into this 26th day of September, 1870, by and between E. S. Parker, Commissioner of Indian Affairs, for and on behalf of the United States, of the first part, and J. W. Bosler, of Carlisle, Pa., of the second part, witnesseth, that the said parties have agreed and do hereby covenant and agree, to and with each other in the manner following, to wit:

In pursuance of an advertisement for "supplies for Indians," dated Department of the Interior, office of Indian Affairs, Washington, D. C., August 26th, 1870, the said J. W. Bosler agrees to furnish at Chicago, Ill., seventy thousand pounds of bacon, clear ribbed sides, for the Yankton, Crow Creek and Cheyenne agencies, in Dakota Territory, respectively; one hundred and forty thousand pounds of bacon, clear ribbed sides, for the Whetstone agency, and one hundred and eighty thousand pounds of bacon clear ribbed sides, for the Grand River agency in Dakota Territory, for the sum of (18) eighteen cents per pound. All of which bacon shall be sound and good quality, and shall be inspected by some person satisfactory to the party of the first part.

In consideration of the faithful performance of this agreement on the part of the party of the second part, he or his representatives shall be paid at the office of the Commissioner of Indian Affairs, at Washington, D. C., on the presentation of certificates of inspection, and the bills of lading from the Northwest Railroad Transportation Company, in Chicago, for the bacon above agreed to be furnished.

In witness whereof the parties hereunto have set their hands and seals the day and date above written.

E. S. PARKER,
Commissioner of Indian Affairs.
J. W. BOSLER.

Signed in presence of—

Articles of agreement, made and entered into this 26th day of September, 1870, by and between E. S. Parker, Commissioner of Indian Affairs, for and on behalf of the United States, of the first part, and the Northwest Transportation Company, by Charles D. Woolworth, its secretary, of Sioux City, Iowa, witnesseth: That said parties have agreed, and do hereby covenant and agree to and with each other in the manner following, to wit:

The Northwest Transportation Company agrees to transport from Sioux City, Iowa, to the following named and described places at the following named and described rates, all the goods and supplies of the Indian Department for the year 1870, of whatsoever kind, and in case the river is so low that freight cannot be delivered by boat, the said party of the second part agrees to transport said goods by wagons, to wit: From Sioux City, Iowa, to Ponca, Santee, and Yankton agencies, at two dollars and twenty-five cents per hundred pounds; from Sioux City to Brule and Crow Creek agencies, at four dollars and twenty cents per hundred pounds: from Sioux City to Whetstone agency, at three dollars and twenty cents per hundred pounds; from Sioux City to Cheyenne agency, at five dollars and twenty-five cents per hundred ; from Sioux City to Grand River, at six dollars and twenty-five cents per hundred pounds; from Sioux City to Fort Berthold agency, at seven dollars and fifty cents per hundred pounds.

In consideration of the faithful performance of this arrangement, on the part of the party of the second part, they or their representatives shall be paid at the office of the Commissioner of Indian Affairs at Washington, D. C., on the presentation of the receipted bills of lading, signed by the respective agents or their substitutes, as above enumerated.

In witness whereof the parties hereunto have hereto set their hands and seals the day and date above written.

E. S. PARKER,
Commissioner of Indian Affairs.
[SEAL.] CHARLES D. WOOLWORTH,
Secretary Northwest Transportation Company.

Signed in presence of—
S. M. WINSHIP,
LEM. JONES.

Know all men by these presents, that J. W. Bosler, of Carlisle, Pennsylvania, as principal, and S. S. Sanders and Joe Bosler as sureties, are firmly bound to the United States in the sum of forty thousand dollars; the same to be well and truly paid to the Commissioner of Indian Affairs of the United States or his successor in office.

The condition of the above obligation is as follows:

That whereas the said bonded J. W. Bosler has entered into a contract with the Commissioner of Indian Affairs, dated September 26, 1870, agreeing to furnish a certain amount of bacon, clear-ribbed sides, for the Indian service in Dakota Territory: Now, in case the said contract is well and truly filled, as therein set forth, then this obligation to be null and void; otherwise to remain in full force and effect.

Witness our hands and seals the day and year above written.

J. W. BOSLER. [SEAL.]
JOE BOSLER. [SEAL.]
S. S. SANDERS. [SEAL.]

[25-cent revenue stamp.]

Know all men by these presents, that we, J. A. Morrow as principal, and John McCormick and E. B. Taylor as sureties, all of the city of Omaha, State of Nebraska, are held and firmly bound unto the United States of America in the sum of one hundred and fifty thousand dollars, lawful money of the United States, for which payment, well and truly to be made, we bind ourselves and each of us, our and each of our heirs,

executors, and administrators, for and in the whole, jointly and severally, by these presents.

Sealed with our seals and dated the 17th day of September, in the year of our Lord eighteen hundred and seventy.

The nature of this obligation is such that if said J. A. Morrow, his heirs, executors, and administrators, or any of them, shall and do in all things well and truly observe, perform, fulfill, accomplish, and keep, all and singular the covenants, conditions, and agreements whatsoever, which, on his or their part, are, or ought to be, observed, performed, fulfilled, accomplished, and kept, comprised or mentioned in certain articles of agreement bearing even date herewith, between William F. Cady, Acting Commissioner of Indian Affairs, for and in behalf of the United States, and the said J. A. Morrow, concerning the delivery of beef at certain Indian agencies in Dakota Territory, according to the true intent and meaning of said articles of agreement, then the above obligation to be void; otherwise to remain in full force and virtue.

J. A. MORROW. [SEAL.]
JOHN McCORMICK. [SEAL.]
E. B. TAYLOR. [SEAL.]

DISTRICT OF COLUMBIA, *County of Washington:*

On this 17th day of September, A. D. 1870, personally appeared before me the above-named John McCormick and E. B. Taylor, who, being duly sworn, each on his oath declares that he is worth as follows: John McCormick, on his oath, declares that he is worth the sum of one hundred and twenty thousand dollars, over and above all his legal debts and the property exempt by law from execution; and E. B. Taylor, on his oath, declares that he is worth over and above the sum of thirty thousand dollars over and above the amount of his legal debts and the property exempt by law from execution.

JOHN McCORMICK.
E. B. TAYLOR.

Sworn to and subscribed before me this day and date above written.

CHARLES P. WEBSTER,
Justice of the Peace for the District of Columbia.

Know all men by these presents, that Charles D. Woolworth, secretary Northwest Transportation Company, as principal, and Joab Lawrence and Gholeson G. Russell as sureties, are firmly bound to the United States in the sum of fifty thousand dollars, the same to be well and truly paid to the Commissioner of Indian Affairs of the United States, or his successor in office.

The condition of the above obligation is as follows: That whereas the said bonded Charles D. Woolworth, secretary Northwest Transportation Company, has entered into a contract with the Commissioner of Indian Affairs, dated September 6, 1870, agreeing to transport certain Indian supplies for the year one thousand eight hundred and seventy: Now, in case said contract is well and truly filled, as therein set forth, then this obligation to be null and void; otherwise to remain in full force and effect.

Witness our hands and seals the day and year above written.

[SEAL.] CHARLES D. WOOLWORTH.
Secretary Northwest Transportation Company.

JOAB LAWRENCE. [SEAL.]
GHOLESON G. RUSSELL. [SEAL.]

Witness:
GEO. K. HAZLETT.
JAMES P. CHARLES.

DEPARTMENT OF THE INTERIOR, OFFICE INDIAN AFFAIRS,
September 10, 1870.

SIR: I am in receipt of your letter of the 1st instant, inclosing one from Agent Poole, with an estimate of subsistence supplies that will be required at the Whetstone agency for the nine months ending June 30, 1871; and referring to the matter of the location of a new agency for Spotted Tail's band, and to the proper route by which to transport goods and supplies furnished for that band and to be delivered at the new agency.

You are advised in reply that the agent's estimate will receive proper attention; also, that the location of an agency for Spotted Tail's band has been left to Messrs. Brunot and Campbell, members of the board of Indian commissioners, who are at present visiting Red Cloud's band of Sioux Indians.

On completing their business with Red Cloud and his followers, it is expected that they will go to the Whetstone agency, or to the section of country where Spotted Tail desires an agency to be established for his band, and select a suitable place for the location of such agency.

After the agency has been established, the question as to the proper route to be adopted to reach it will be considered.

Very respectfully, your obedient servant,

WM. F. CADY,
Acting Commissioner.

Hon. J. A. BURBANK,
Governor and ex-officio Superintendent Indian Affairs, Yankton, D. T.

WHETSTONE AGENCY, DAKOTA TERRITORY,
August 29, 1870.

SIR: I have the honor to call the attention of the Department to the fact that the rations for issue to Indians at this agency will be entirely exhausted by the 30th of next month, (September,) except beef cattle, of which there is a full supply.

Inclosed I have to submit an estimate for nine months' supply.

It will be observed that no increase is made in component parts of the rations.

Spotted Tail and Swift Bear were promised while in Washington that there should be an increase in sugar and coffee and other parts of the ration. They often speak of this promise. No instructions haye been received at this office in reference to the same.

Very respectfully, your obedient servant,

DE WITT C. POOLE,
Captain United States Army and Indian Agent.

Hon. JOHN A. BURBANK,
Governor and ex-officio Superintendent Indian Affairs, Yankton, D. T.

EXECUTIVE OFFICE,
Yankton, Dakota Territory, July 15, 1870.

SIR: I have the honor to inclose herewith a letter from Captain D. C. Poole, Indian agent at the Whetstone agency, dated July 10, relative to the matter of receiving from J. W. Bosler the beef cattle purchased for the use of the Yankton Sioux Indians, and requesting that on account of the scarcity of grass near the agency, and the liability of losing the cattle in the adjoining hilly country, he be allowed to herd them on the Yankton reservation. Touching that portion of the agent's letter which relates to the matter of receiving the cattle from the contractor, I would say that Agent Poole has been directed to follow out the instructions contained in your letter to Mr. Bosler, the contractor.

The bottom lands of the Yankton reservation contain good grass, and are well adapted to the herding of cattle, but as the Yankton Indians will doubtless be opposed to having the Government cattle on these lands, I would suggest that the agent be directed to first make some agreeable arrangement with them in council for this purpose, or to move them to other vacant lands, if suitable ones can be found.

Very respectfully, your obedient servant,

JOHN A. BURBANK,
Governor and ex-officio Superintendent Indian Affairs.

Hon. E. S. PARKER,
Commissioner Indian Affairs, Washington, D. C.

EXECUTIVE OFFICE,
Yankton, Dakota Territory, September 1, 1870.

SIR: I have the honor to inclose herewith letter of Captain De Witt C. Poole, Indian agent at Whetstone agency, dated August 29, together with his estimates of subsistence supplies required of bacon, coffee, flour, soap, and salt, for five thousand Indians, commencing October 1, 1870, and to last until the 30th of June, 1871.

I will state, for your information, that Spotted Tail expects to go with his band to a reservation about thirty miles above the forks of White River, and between the two branches.

Spotted Tail says that this was promised him, and he is somewhat annoyed at the delay, saying that it is utterly impossible for him to hold and control his people unless the proper steps are taken within thirty days to carry out this promise, and that it

will be useless for him to attempt to keep his people together and under the proper subjection. He fears, in case of delay, that a great number may be induced to join Indians who are unfriendly to the Government.

Should he be allowed to go, as he wishes, to this reservation, he will be located about one hundred and seventy miles from Whetstone, and about one hundred miles from the Lower Brulé agency.

The road from the Lower Brulé agency is much more practicable, not only on account of the saving of seventy miles of hauling, but a road can be made at or near the river bank, where wood and water can be procured, and this will make the freighting much cheaper per mile than from Whetstone agency. I would suggest the propriety of delivering rations for Spotted Tail's camp in the ratio of, say, three out of five thousand at the Lower Brulé agency, to be transported by wagon from that point.

I would also state that if this is done, a warehouse for the storage of the goods at Lower Brulé agency should be erected at once, so as to properly care for the supplies before they are shipped by wagon.

Very respectfully, your obedient servant,

JOHN A. BURBANK,
Governor and ex-officio Superintendent Indian Affairs.

Hon. E. S. PARKER,
Commissioner Indian Affairs, Washington, D. C.

DEPARTMENT OF THE INTERIOR,
Office Indian Affairs, June 18, 1870.

SIR: I am in receipt of your letter of the 11th instant, inclosing one from Agent French, relative to certain subsistence stores that will be required for the use of Indians at the Crow Creek agency, and requesting that a supply of the articles named in the agent's letter be sent to the agency at the earliest moment possible.

You are advised, in reply, that proper steps have been taken by this Bureau to have the necessary supplies furnished for the use of the Indians at said agency. The supplies will probably reach that place between the 1st and 15th proximo, and you will please advise Agent French accordingly.

Very respectfully, your obedient servant,

WM. F. CADY,
Acting Commissioner.

Hon. JOHN A. BURBANK,
Governor and ex-officio Superintendent Indian Affairs, Yankton, D. T.

EXECUTIVE OFFICE,
Yankton, Dakota Territory, July 19, 1870.

SIR: I have the honor to inclose herewith Agent Hearn's monthly report for June, 1870.

Very respectfully, your obedient servant,

J. A. BURBANK,
Governor and ex-officio Superintendent Indian Affairs.

Hon. E. S. PARKER,
Commissioner Indian Affairs, Washington, D. C.

GRAND RIVER AGENCY, D. T., *July* 1, 1870.

SIR: I have the honor to make the following report for the month of June, 1870:

The number of Indians located at this agency the past month was 1,006 lodges; they have behaved themselves remarkably well.

We are entirely out of flour and bacon; coffee and sugar will last until July 31, 1870, and corn until January, 1871.

Many Indians are dissatisfied, and think the Government is going to stop feeding and clothing them, as their supply of provisions for the coming year has not arrived and they are living on corn and beef.

I respectfully request that supplies be forwarded as soon as possible, if they are not already on the way.

I am, very respectfully, your obedient servant,

J. A. HEARN,
Captain and Brevet Major United States Army, Indian Agent.

Hon. E. S. Parker,
Commissioner of Indian Affairs, Washington City, D. C.

(Through Hon. J. A. Burbank, Superintendent.)

P. S. Since writing the above, I have been informed that three young men belonging to the Oncpapa band of Sioux have stolen eight animals, as follows:

John B. Dillon, one American horse and three mules; Thomas Smith, one mule; George Carey, one Indian horse; Commissary Department, United States Army, two American horses.

J. A. HEARN.

DEPARTMENT OF THE INTERIOR, OFFICE INDIAN AFFAIRS,
Washington, D. C., June 18, 1870.

SIR: I have the honor to state that arrangements have been made by this Bureau with James W. Bosler, esq., for the delivery of certain subsistence supplies for the use of the Indians on the Yankton, Whetstone, Cheyenne, Crow Creek, and Grand River reservations. Among these supplies there will be a quantity of beef, and the cattle will have to be driven to the different reservations, where they are to be slaughtered, and the beef issued to the Indians. There will, doubtless, be considerable risk to the contractor in transporting these cattle, owing to the wild and unsettled condition of the country through which they will have to be driven; and, in view of this fact, I respectfully recommend that the Secretary of War be requested to furnish Mr. Bosler with suitable escorts, from Forts Randall and Sully, to the respective reservations whenever he shall require them.

Very respectfully, your obedient servant,

E. S. PARKER, *Commissioner.*

Hon. J. D. COX, *Secretary of the Interior.*

DEPARTMENT OF THE INTERIOR,
Washington, D. C., June 21, 1870.

SIR: Arrangements have been made by the Indian Bureau, with James W. Bosler esq., for the delivery of subsistence supplies for the Indians on the Yankton, Whetstone, Cheyenne, Crow Creek, and Grand River reservations.

As beef cattle are included in the supplies, which are to be driven to the points above named, I have the honor to request that the contractor may be furnished with suitable escorts from Forts Randall and Sully to the respective Indian reservations, whenever he shall require them.

Very respectfully, your obedient servant,

J. D. COX, *Secretary.*

The Honorable SECRETARY OF WAR.

WAR DEPARTMENT,
Washington City, July 11, 1870.

SIR: Referring to your letter of the 21st ultimo, I have the honor to inform you that instructions have been given to the commanding officer at Fort Randall, Dakota Territory, to furnish an escort from that post to Fort Sully, Dakota Territory, to James W. Bosler, for his train of stores and herd of cattle intended for the Indian service, and that the commanding officer at Fort Sully has been directed to furnish an escort from that post to the Yankton, Whetstone, Cheyenne, Crow Creek, and Grand River Indian reservations.

Mr. Bosler should be notified to apply to the commanding officer at Fort Randall whenever the escort is required, and should also be informed that owing to the small garrisons it will not be practicable to furnish more than one escort from each post. The trains and herds must, therefore, be concentrated before leaving Fort Randall.

Very respectfully, your obedient servant,

WM. W. BELKNAP,
Secretary of War.

The Honorable SECRETARY OF THE INTERIOR.

[Referred to in Mr. Colyer's testimony.]

WASHINGTON, D. C., *July* 19, 1870.

SIR: Will you favor our board of Indian commissioners with your interpretation of that portion of the new Indian appropriation law which says:

"It shall be the duty of said commissioners to supervise all expenditures of money

appropriated for the benefit of the Indians in the United States, and to inspect all goods purchased for said Indians, in connection with the Commissioner of Indian Affairs, whose duty it shall be to consult said commissioners in making purchases of said goods."

It is more particularly with reference to the first clause, as contained in the first three lines, that there may be a word or two of explanation desirable.

Our wish is simply to obtain from you your idea of about what the House of Representatives expect from us, in order that we may neither transcend nor fall short of our duty under the above law.

Very respectfully, your obedient servant,

VINCENT COLYER,
Secretary.

HON. AARON A. SARGENT,
Chairman Sub-committee on Appropriations, House of Representatives.

COMMITTEE ON APPROPRIATIONS, HOUSE OF REPRESENTATIVES,
July 20, 1870.

DEAR SIR: In answer to your note asking my interpretation of the following provision of the new Indian appropriation bill, viz: "It shall be the duty of said commissioners to supervise all expenditures of money appropriated for the benefit of the Indians in the United States, and to inspect all goods purchased for said Indians, in connection with the Commissioner of Indian Affairs, whose duty it shall be to consult said commissioners in making purchases of said goods," I reply that it seems to me its meaning is on the surface. Congress desires that your commission shall oversee and advise in all contracts for or purchases of Indian goods; shall see that the articles bought are suitable, and the prices reasonable; that the kind and amount of goods contracted for are delivered; that annuities are properly paid; that presents are justly and judiciously given; in short, that you shall "supervise all expenditures of money appropriated for the Indians." This is expressly made your duty by the statute, and your board must fulfill it, or resign. It makes it the duty, also, of the Indian Commissioner to consult your board in all purchases for the Indians. You do not expend the money, for that is the duty of the Commissioner. But you have a right to know of and advise in all expenditures, all receipts for goods, &c. In case of a difference of opinion between yourself and the officer charged with the disbursement, you can only advise and report to the Secretary the facts which induce your dissent. I do not think, however, in view of the earnest desire of the Secretary and the Commissioner of Indian Affairs for an honest and efficient administration of Indian affairs, that your board will have any difficulty in complying with the requirements of the provision in question.

Respectfully,

A. A. SARGENT.

VINCENT COLYER, Esq.,
Secretary Board of Indian Commission.

WASHINGTON, *D. C., February* 3, 1871.

I certify that the above are true copies of the original papers on file in this office.

VINCENT COLYER,
Secretary of the Board of Indian Commissioners.

Memorandum

Of contract made and entered into this 25th day of March, 1868, in the city of New York, by and between Charley D. Woolworth, secretary and general agent of the Northwest Transportation Company, on behalf of said company, which is an incorporated company, of which Joel Lawrence, of St. Louis, is president, of the first part, and N. G. Taylor, Commissioner of Indian Affairs of the United States, of the second part, as follows, to wit:

1. The said party of the first part agrees to transport the goods and merchandise for the Indian Department that may be required for the Indians and agencies of the Upper Missouri River and on said river, above Sioux City, from the 1st day of April, 1868, to October 1, 1868. To receive said goods in the city of New York and Chicago, and to transport them by the most direct route by railroad to Sioux City, Iowa, and from there by first-class steamers to their several places of destination, and to deliver the same to the agent or agents of the Indian Department. The said party of the first part will have an agent in the city of New York to receive said goods, and ship them immediately.

2. In consideration of the faithful performance of all the stipulations of this contract, by the party of the first part, the said party of the second part shall pay or cause to be paid to the said party of the first, as follows:

3. From the city of New York to all points between Yankton and Fort Sully, including both, $7 72 per 100 pounds. From New York to Fort Rice, and points between Sully and Rice, $8 72 per 100 pounds. From New York to Fort Union, and points between Rice and Union, $9 72 per 100 pounds. From New York to Muscleshell, and points between Union and Muscleshell, $10 72 per 100 pounds. From New York to Fort Benton, and points between Muscleshell and Benton, $11 72 per 100 pounds; and for all freight transported from Chicago to either of the above points, $2 less per 100 pounds than from New York to same points. That bills of lading, receipted by the agent or consignee, approved by the superintendent Indian affairs for Dakota, except as to Fort Benton, of said goods at the several places of delivery of said goods, shall be evidence of the proper delivery of the same, and upon the presentation of said receipted bills of lading payment will be made at the office of the Commissioner of Indian Affairs in the city of Washington, at the rates above mentioned, in such funds as may be provided said Commissioner for such purpose.

4. The said party of the second part also agrees that all the goods shipped for the points above mentioned during the time specified in this contract, and over which the Commissioner of Indian Affairs has control, shall be delivered to the party of the first part, or their agent, for shipment.

5. Nothing in this contract shall be construed to prevent the Commissioner of Indian Affairs or any other agent of the Indian Department from purchasing goods and supplies delivered at the agencies or points above mentioned.

CHARLES D. WOOLWORTH,
Secretary Northwest Transportation Company.
N. G. TAYLOR,
Commissioner of Indian Affairs.

Attest:
J. W. BOSLER.
G. B. KETLER.
[5-cent revenue stamp.]

Articles of agreement

Made and entered into this 13th day of May, 1869, in the city of New York, by and between G. T. Nutter, agent of the Northwest Transportation Company, which is an incorporated company, of which Jacob Lawrence, of St. Louis, is president, on behalf of said company, of the first part, and E. S. Parker, Commissioner of Indian Affairs of the United States, of the second part, as follows, viz:

The said party of the first part agrees to transport the goods and merchandise for the Indian Department which may be required for the Indians and agencies of the Upper Missouri River, from this date (May 13, 1869) to July 12, 1869; to receive said goods in the city of New York and to transport them by the most direct route by railroads, in sound and water-proof cars, to Sioux City, Iowa, and from there by first-class steamers to their respective places of destination, and to commence the transportation of said goods as soon as notified by the Commissioner of Indian Affairs that said goods are ready to be shipped, and to complete such transportation as quickly as possible and without any unnecessary delay.

2. In consideration of the faithful performance of all the stipulations of this contract by the party of the first part, the said party of the second part shall pay or cause to be paid to the said party of the first part for such transportation, as follows:

From the city of New York to all points on the Missouri River between Yankton and Fort Sully, including both, $7 72 per 100 pounds. From New York to Fort Rice, and all points between Fort Sully and Fort Rice, $8 72 per 100 pounds. From New York to Fort Buford, and all points between Fort Rice and Fort Buford, $9 72 per 100 pounds. From New York to Muscleshell, and all points between Fort Buford and Muscleshell, $10 72 per 100 pounds. From New York to Fort Benton, and all points between Muscleshell and Fort Benton, $11 72 per 100 pounds.

Bills of lading for said goods, receipted by the respective agents or superintendents (if agents, the same to be certified by the superintendents) at the several places of delivery, shall be evidence of the proper delivery of the same, and upon presentation of said receipted bills of lading, payment will be made at the office of the Commissioner of Indian Affairs, in the city of Washington, at the rates above mentioned, in such funds as may be provided said Commissioner for said purpose.

The said party of the second part also agrees that all the goods shipped from New York City, for the points above mentioned, during the time specified in this contract,

viz, from this date to July 12, 1869, over which the Commissioner of Indian Affairs has control, shall be delivered to the party of the first part, or his agent, for shipment.

It is, however, further agreed that before the United States shall be bound by this contract, a bond in the sum of $20,000 shall be executed by the said President of the Northwest Transportation Company, with two or more good and sufficient sureties, said bond to be conditioned for the faithful performance of this contract, in all its particulars, by the said party of the first part.

In witness whereof, the parties hereto have hereunto set their hands and seals, on the day and year above mentioned.

G. T. NUTTER, [L. S.]
Agent Northwest Transportation Company.
E. S. PARKER, [L. S.]
Commissioner of Indian Affairs.

Signed in the presence of—
LEWIS HAYDEN.

Statement of shipments of supplies on the Missouri River during the year 1870, *under the contracts of H. K. Hazlett, dated February* 17, 1870, *and George K. Hazlett, dated February* 16, 1870.

Month.	Military supplies.	Indian supplies.	Total.
1870.			
	Pounds.	*Pounds.*	*Pounds.*
March	816,261	19,161	835,422
April	2,081,075	228,285	2,309,360
May	2,118,230	138,755	2,256,985
June	1,810,959	42,334	1,853,293
July	235,461	.....	235,461
August	1,390,744	.....	1,390,744
September	592,360	82,770	675,130
October	881,138	.....	881,138
November	95	.....	95
Total	9,926,323	511,305	10,437,628

REMARKS.—Colonel Holabird, chief quartermaster Department of Dakota, reports also 65,794 pounds, shipped in November, which do not appear as yet as paid for. This was after the expiration of the contract season, and was probably not paid for under the contract terms.

Statement of weights of supplies shipped on the Missouri River under the Hazlett contracts during the year 1870, *from the accounts of the disbursing officers of the Quartermaster's Department who paid for the services.*

(To replace the imperfect statements handed the House Sub-committee on Indian Affairs, at the time General Meigs appeared under its summons.)

By the terms of these contracts the United States could require of the contractor transportation for 20,000,000 pounds each, making a total of 40,000,000 pounds. One contract starting from St. Louis, the other from Chicago.

M. C. MEIGS,
Quartermaster General, Brevet Major General U. S. Army.

QUARTERMASTER GENERAL'S OFFICE, *February* 1, 1871.

OSAGE AGENCY, KANSAS,
Montgomery P. O., 10th mo. 13, 1870.

ESTEEMED FRIEND: This day I forward by express to thy address, as per request of Vincent Colyer, secretary of commission, one scarlet blanket, 3-point, and one Mexican blanket; the first as a sample of 50 pair out of 200, at $8 per pair, sent as presents to the Osage Indians, from the house of Buckley, Welling and Company, New York City, of date August 23, 1870. The remaining 150 pair were a grade better.

The Mexican blankets are billed $6 50 apiece. They are not worth half that money to Indians, as a baby can slip through them without breaking a warp or filling.

Very respectfully,

ISAAC T. GIBSON,
United States Indian Agent.

W. E. DODGE,
Indian Peace Commissioner.

Williamson's instructions.

DEPARTMENT OF THE INTERIOR, OFFICE OF INDIAN AFFAIRS,
Washington, D. C., September 8, 1870.

SIR: Having been appointed a special agent of the United States to make payment to the Creek soldiers, loyal refugees, and freedmen, under the fourth article treaty of June 14, 1866, with the Creek Nation; to the Pottawatomie Citizen Indians in Kansas, under the third article treaty of November 15, 1861, as modified by the treaty of March 29, 1866, with the Pottawatomies; to the Peoria, Kaskaskia, Wea, and Piankeshaw Citizen Indians, under the twenty-eighth article treaty of February 23, 1867, with said tribes and other Indians; and to the Seneca, Mixed Seneca and Shawnee, and Quapaw claimants, under the 12th article of the treaty last referred to; and having filed your bond for the faithful performance of your duties as such special agent, the following instructions are herewith presented for your information and guidance:

It is desired that the payment to the Creek soldiers, loyal refugees, and freedmen be made first, and I have, therefore, this day caused a requisition to issue for $100,000, the amount provided to be paid under said fourth article of the Creek treaty of 1866 to be remitted to you present, from the appropriation "fulfilling treaty with Creeks," (payment of loyal Creeks, &c.,) for the proper care and disposition of which sum you will be held to account under your bond.

The payment to said soldiers, refugees, and freedmen will be made on the "schedule of payments" on pay-roll herewith inclosed, which shows the names of the claimants, the amount awarded to each person by the commission appointed to investigate the several claims, and the pro rata of the $100,000, being $\frac{544}{1000}$ of one dollar, on the sum awarded, to which each claimant is entitled.

In making the payment, each individual to whom the money is due and paid must be required to sign said pay-roll, opposite to his or her name, in the presence of two or more witnesses and an interpreter. One of the witnesses should sign the pay-roll opposite to the names of the persons whose signatures he witnessed, and the others should attach their certificate at the end of the pay-roll, to the effect that they were present and saw the payment made in each case as therein stated. The interpreter, in addition to the foregoing, should certify that he was present and explained to the several claimants for what object and on what account the money was paid. It is desired, if practicable, that one of the two members—hereafter named—of the board of Indian commissioners should attest the signatures, and that the gentlemen who accompany you from this city, and any other person or persons that may witness the payment, should attach their certificate at the end of the pay-roll.

Messrs. J. D. Lang and Vincent Colyer, of the board of Indian commissioners, are expected to be present at the payment; and, in compliance with the instructions of the Honorable Secretary of the Interior, I have designated Mr. G. F. Jocknick, a clerk in this office, and Mr. J. E. Pilkington, of the Interior Department, to accompany you from this city to witness the payment and render you such clerical assistance as may be necessary. It is also expected that Agent Field will be present, at least a portion of the time, while the payment is being made. He is instructed to do so by the inclosed letter, which you will please deliver to him, and also to have the agency interpreter attend during the entire time, to make such explanations to the claimants as may be necessary, as well as to witness the payment.

In no case must a payment be made to any claim agent, attorney, or trader, or to any other person than the one in whose favor the award was made; unless where the claimant may have died, in which event payment will be made to the heirs or legal representatives of such deceased claimant. In determining the proper person or persons to whom payment of the amount due to a deceased claimant should be made, you will be governed by the laws, customs, and usages of the Creek Nation. Letters of administration must, in all cases, be presented by the individual to whom a payment is made as administrator; and in case you are unable to obtain a copy thereof properly certified by a probate judge, you will cause a copy to be made and have the same certified to be a correct transcript of the original, by one or both of said members of the board of Indian commissioners; or, should neither of said members be present to certify, it can be certified by yourself. When payments are made direct to the heirs of deceased claimants, their identity must be fully established, and the validity of their claims must be acknowledged by the proper authority of the Creek Nation.

Great care must be exercised in ascertaining and determining the identity of the claimants, and of the heirs and representatives of those who may have deceased; and in case any one entitled to share in the payment cannot be found, his or her portion of the money will be retained by you, and should the amount so retained not exceed the sum of $10,000, you are authorized to transfer the same to Enoch Hoag, superintendent of Indian affairs at Lawrence, Kansas, taking his receipt therefor, which will be considered a sufficient voucher in the settlement of your accounts, and giving him at the same time a copy of these instructions, or so much thereof as refers to the manner of disbursing the money, with such information in regard to the matter as you may be able to give him, for his guidance in completing the payment. Should the amount retained as above exceed said sum of $10,000, you will deposit the same in the nearest United States depository to the credit of the United States, and transmit the original certificate of deposit to this office.

After making payment to the Creeks, you will proceed to pay the Senecas, Mixed Senecas and Shawnees, and Quapaws; the Peorias, Kaskaskias, Weas, and Piankeshaws; and the Pottawatomies, in the order named. The money to make these payments will be placed to your credit with the Assistant Treasurer of the United States at St. Louis, Missouri, and the necessary pay-rolls and instructions will be forwarded to the same place, to the care of said Assistant Treasurer, on being advised by you as to the time when the same will be required.

By direction of the Secretary of the Interior, you will be required to render your accounts to this office immediately after each payment.

Very respectfully, your obedient servant,

W. F. CADY,
Acting Commissioner.

J. A. WILLIAMSON, Esq.,
United States Special Agent, Washington, D. C.

Articles of agreement

Made this 15th day of July, 1869, by and between Samuel M. Janney, superintendent of Indian affairs, of the one part, and John Finn, of St. Louis, State of Missouri, of the other part.

This agreement witnesseth, that the said Samuel M. Janney, superintendent of Indian affairs, for and in behalf of the United States of America, and the said John Finn, for himself, his heirs, executors, and administrators, have mutually agreed, and by these presents do mutually covenant and agree, to and with each other, in manner following, to wit:

1st. That the said John Finn shall deliver at the Winnebago agency, at their reservation, in Nebraska, the articles, in quantity and quality as hereinafter specified, and at the prices designated, as herein agreed upon, viz: 7,000 pounds of beef per week, net weight, at the rate of 6.90 cents per pound; also, 1,500 pounds of salt per month, at the rate of 2 cents per pound, up to the first day of July, 1870.

2d. The said articles of subsistence to be subject, in the furnishing thereof, to the following restrictions, as designated in the published proposal of Samuel M. Janney, superintendent of Indian affairs, dated 6th mo., (June,) 23, 1869, and appearing in the papers of Omaha, Nebraska, viz:

"All articles of subsistence furnished must be of good quality, and subject to inspection and rejection by the agent of the Winnebagoes.

"The right is reserved to increase or diminish the amount of supplies at the discretion of the superintendent of Indian affairs for the northern superintendency; also to terminate the contract that may be entered into, on giving the contractor, or contractors, six weeks' notice."

3d. Payment shall be made by the superintendent of Indian affairs at Omaha, Nebraska, when funds are placed in his hands for that purpose; but in the event of the superintendent of Indian affairs being without funds, then payment to be made as soon after as funds may be received for that purpose.

4th. That in case of failure or deficiency in the quantity or quality of the stores to be delivered, the superintendent of Indian affairs shall have the power to supply the deficiency by purchase, and the said John Finn will be charged with the difference of cost.

In witness whereof the undersigned have hereunto placed their hands and seals the day and date first above written.

SAM'L M. JANNEY, [SEAL.]
Superintendent Indian Affairs.
JOHN FINN. [SEAL.]

Articles of agreement

Made this 4th day of October, 1869, by and between Samuel M. Janney, superintendent of Indian affairs, of the one part, and Walter A. Burleigh, of Bonhomme, Dakota Territory, of the other part.

This agreement witnesseth, that the said Samuel M. Janney, superintendent of Indian affairs, for and in behalf of the United States of America, and the said W. A. Burleigh, for himself, heirs, executors, and administrators, have mutually agreed, and by these presents do mutually covenant and agree, to and with each other, in manner following, to wit:

1st. That the said W. A. Burleigh shall deliver at Santee Sioux agency the articles, in quantity and quality, as hereafter specified, and at the prices designated, as herein agreed upon, viz: 5,000 pounds of beef per week, at the rate of 7.22 per pound, net weight; also, 5,000 pounds of flour per week, at 3.35 per pound. The said articles of subsistence to be subject, in the furnishing thereof, to the following restriction, as designated in the published proposal of Samuel M. Janney, superintendent Indian affairs, dated September 12, 1869, and appearing in the papers of Omaha, Nebraska, viz: "All articles of subsistence furnished must be of good quality, and subject to inspection and rejection by the agent of the Santee Sioux. The right is reserved to increase or diminish the amount of supplies, at the discretion of superintendent of Indian affairs for the northern superintendency; also, to terminate the contract that may be entered into on giving the contractor six weeks' notice."

3d. Payment shall be made by the superintendent of Indian affairs at Omaha, Nebraska, when funds are placed in his hands for that purpose; but in the event of the superintendent of Indian affairs being without funds, then payment to be made as soon after as funds may be received for that purpose.

4th. That in case of failure or deficiency in the quantity or quality of the stores to be delivered, the superintendent of Indian affairs shall have the power to supply the deficiency by purchase, and the said W. A. Burleigh will be charged with the difference of cost.

In witness whereof the undersigned have hereunto placed their hands and seals the day and date first above written.

SAM'L M. JANNEY,
Superintendent Indian Affairs.
W. A. BURLEIGH.

[50-cent int. rev. stamp.]

DEPARTMENT OF THE INTERIOR, OFFICE OF INDIAN AFFAIRS,
Washington, D. C., July 13, 1870.

SIR: I am in receipt of your letter of the fifth instant, inclosing one from Agent Poole, who submits an estimate for employés required for herding beef cattle at the Whetstone agency.

Agreeably to your recommendation, the agent will be allowed to employ one herder and six Indian assistants, at the salaries named in said estimate; also, to purchase the horses, saddles and bridles referred to in such estimate, at a cost not to exceed $75 for each horse and set of equipments complete. The employés will be required to subsist themselves; or, if furnished rations, a corresponding reduction will be made in the amount paid to each for his services.

You will please advise Agent Poole that, with the cattle received from the Commissary Department, and those to be delivered by Mr. Bosler, it is expected there will be enough beef at said agency to last six months. He should advise the Indians belonging to the Whetstone agency of the fact that all these cattle are intended for them; that they must last them six months at least, and that care should be taken to prevent any of them from being lost, or uselessly killed.

Very respectfully, your obedient servant,

E. S. PARKER, *Commissioner.*

Hon. JOHN A. BURBANK,
Governor and ex-officio Superintendent Indian Affairs, Yankton, D. T.

Certificate of payments.

Gregory & Edgar, Yankton:
December 3, 1870—Flour, at $3 20 per sack of 98 pounds, delivered at Ponca agency free of expense.

Walter A. Burleigh:

TREASURY DEPARTMENT, SECOND AUDITOR'S OFFICE,
January 25, 1871.

I certify the foregoing to be a correct abstract from settlements on file in this office.
E. B. FRENCH, *Second Auditor.*

Articles of agreement

Entered into this 18th day of June, 1869, between Henry F. Clarke, assistant commissary general of subsistence and brevet major general in the Army of the United States of America, of the one part, and Edward Fenlon, of the city of Leavenworth, in the county of Leavenworth, in the State of Kansas, of the other part.

This agreement witnesseth: That the said Henry F. Clarke, for and on behalf of the United States of America, and the said Edward Fenlon, for himself, his heirs, executors, administrators, (or for himself, his heirs, executors, and administrators, as the case may be,) have mutually agreed, and by these presents do mutually covenant and agree, to and with each other, as follows, viz:

1. That the said Edward Fenlon shall deliver to the acting commissary of subsistence United States Army, or the authorized agent of that department, at the usual place of delivery at Whetstone Creek, Dakota Territory, the following supplies for issues to Indians, viz: 2,475 head of beef cattle on the hoof.

To deliver to the like officer or agent, at the usual place of delivery at Big Cheyenne River, Dakota Territory, for a like purpose, 3,025 head of beef cattle on the hoof; and to the like officer or agent, at the usual place of delivery at Grand River, Dakota Territory, for a like purpose, 3,575 head of beef cattle on the hoof.

2. The beef cattle must be steers, in good healthy condition, and must average as nearly as possible 1,000 pounds live weight, the weight to be determined by weighing on the scales when delivered. Their delivery must commence at each of the places named on or before July 31, 1869, and continue until the number provided for by this contract is delivered, at the rate of 225 head per month at Whetstone Creek, 275 at Big Cheyenne River, and 325 at Grand River; and there shall be at all times, at each place named, a full proportional supply of beef cattle for issues to the Indians supplied therefrom.

3. The beef cattle provided for by these specifications for the respective places named herein for their delivery are required to be held by the contractor, the said Edward Fenlon, sufficiently near thereto that he may, with certainty, and at the rate and under the conditions above specified, deliver them weekly, semi-monthly, or monthly, as the officers or agents of the Subsistence Department may require; and the total number of them due under this contract, at each of those places, shall be in like position to them by September 15, 1869.

4. For the beef cattle delivered and accepted in accordance with the foregoing specifications, the contractor, the said Edward Fenlon, shall receive as follows, viz: For each and every 100 pounds of beef cattle, live weight, delivered at Whetstone Creek, $4 44¾; for each and every 100 pounds of beef cattle, live weight, delivered at Big Cheyenne River, $4 44¾; and for each and every 100 pounds of beef cattle, live weight, delivered at Grand River, $4 44¾.

Payment to be made in the currency of the country by the purchasing commissary of subsistence United States Army, at Chicago, Illinois, on the presentation of proper receipts of the officers of the Subsistence Department United States Army, or its authorized agents, at the respective points of delivery, if he has funds for the purpose; if not, as soon as they can be obtained.

5. If at any time there should be good reason for believing the contractor, the said Edward Fenlon, will not have at all times an ample supply of beef cattle as herein specified ready for delivery, the Subsistence Department United States Army, through its officers or authorized agents, shall have power to purchase a full sufficiency of such supplies, and the difference between the contract price and the price paid by the Subsistence Department shall be charged to the contractor, the said Edward Fenlon.

6. No member of Congress, officer or agent of the Government, or any person employed in the public service shall be admitted to any share herein, or to any benefit which may arise therefrom.

In witness whereof the undersigned have hereunto set their hands and seals the date first above written.

H. F. CLARKE, [SEAL.]
Brevet Major General and Acting Commissary General of Subsistence.
EDWARD FENLON. [SEAL.]

B. DUBARRY,
Major and Commissary of Subsistence.

Articles of agreement

Entered into this 6th day of July, 1869, between Henry F. Clarke, assistant commissary general of subsistence and brevet major general in the Army of the United States of America, of the one part, and Edward Fenlon, of the city of Leavenworth, in the county of Leavenworth, in the State of Kansas, of the other part, being supplementary to the articles of agreement entered into by the said parties the 18th day of June, 1869, for the delivery of beef cattle at Whetstone Creek, Big Cheyenne River, and Grand River, Dakota Territory.

This supplementary agreement witnesseth: That the said Henry F. Clarke, for and on behalf of the United States of America, and the said Edward Fenlon, for himself, his heirs, executors, and administrators, have mutually agreed, and by these presents do mutually covenant and agree, to and with each other as follows, viz:

1. That article 1st of the articles of agreement entered into between said parties on the 18th day of June, 1869, for the delivery of beef cattle for issues to Indians at Whetstone Creek, Big Cheyenne River, and Grand River, Dakota Territory, shall be modified or changed so as to require as follows, viz:

That the total number of beef cattle on the hoof required to be delivered at Whetstone Creek shall be reduced to 1,935 head, the total number of beef cattle on the hoof to be delivered at Big Cheyenne River shall be reduced to 2,025 head, and the total number of beef cattle on the hoof to be delivered at Grand River shall be reduced to 3,215 head. And there shall be delivered to the acting commissary of subsistence, or other authorized agent of the Subsistence Department, at the usual place of delivery, at the Yankton Indian Agency, Dakota Territory, 900 head of beef cattle on the hoof; and to like officer or agent, at the usual place of delivery, at the Crow Creek Indian agency, Dakota Territory, 1,000 head of beef cattle on the hoof.

2. The beef cattle delivered at each of the places named in the preceding article must be steers, in good healthy condition, and average as nearly as possible 1,000 pounds live weight, the weight to be determined by weighing on the scales when delivered. Their delivery to commence at each of those places on or before July 31, 1869, and continue until the number provided for by this contract is delivered, at the rate, as nearly as practicable, of 82 head per month at Yankton agency, 176 head at Whetsone Creek, 91 head at Crow Creek agency, 184 head at Big Cheyenne River, and 292 head at Grand River; and there shall be at all times, at each place named, a full proportioned supply of beef cattle for issue to the Indians supplied therefrom.

3. The party of the first part agrees to pay the party of the second part $125 per month for each of the two additional points of deliveries provided for in this supplementary contract, to pay for herding at such points.

4. The articles of agreement entered into between the said Henry F. Clarke and Edward Fenlon, the 18th day of June, 1869, for the delivery of beef cattle on the hoof at Whetstone Creek, Big Cheyenne River, and Grand River, Dakota Territory, except so far as modified or changed by these supplementary articles of agreement, shall remain in full force and be construed as applying to the deliveries of beef cattle on the hoof at Yankton and Crow Creek Agencies, herein provided for.

In witness whereof the undersigned have hereunto set their hands and seals, the date first above written.

Major and Commissary Subsistence.

CHICAGO, ILLINOIS, *September* 21, 1869.

DEAR SIR: I wish to substitute the following for my proposition for the 18th instant in relation to additional beef cattle.

I will furnish any additional number of beef cattle that may be required at Yankton, Whetstone Creek, Crow Creek, Big Cheyenne River, and Grand River Indian agencies, Dakota Territory, under same terms as contract of June 18 and supplementary contract of July 6, 1869, at $4 20 per 100 pounds gross weight, during the continuance of said contracts—that is, to June 30, 1870.

This price to be paid to me for all beef cattle delivered over and above the total number, 9,075, provided for by said contracts.

Very respectfully,

EDWARD FENLON.

General H. F. CLARKE, *Chicago, Illinois.*

OFFICE COMMISSARY GENERAL OF SUBSISTENCE, *January* 23, 1871.

B. DUBARRY,
Major and Commissary of Subsistence.

HEADQUARTERS MILITARY DIVISION OF THE MISSOURI,
OFFICE CHIEF COMMISSARY OF SUBSISTENCE,
Chicago, Illinois, September 21, 1869.

SIR: Your proposition of this date to furnish any additional number of beef cattle that may be required at Yankton, Whetstone Creek, Big Cheyenne River, and Grand River Indian agencies, Dakota Territory, under the same terms as present contract and supplementary contract, at $4 20 per 100 pounds gross weight, during the continuance of said contract to June 30, 1870, and which you wish to substitute for your proposition of the 18th instant, is accepted.

The price just stated to be paid you for all beef cattle delivered as per your proposition of this date, over and above the total number (9,075) provided for by said contracts.

Very respectfully, your obedient servant,

H. F. CLARKE,
Bvt. Maj. Gen., Acting. Com. Gen. of Subsistence,
Chief Com. of Subsistence, Mil. Div. Missouri.

OFFICE COMMISSARY GENERAL OF SUBSISTENCE, *January* 23, 1871.

Proposals for Indian goods.

DEPARTMENT OF THE INTERIOR,
Office of Indian Affairs, July 29, 1870.

Sealed proposals, indorsed "Proposals for Indian goods," will be received by the undersigned at No. 339 Canal street, New York City, until 12 o'clock m. on Thursday, the 4th day of August next, for furnishing, in the quantities therein given, the articles named in the following list:

3,200 pairs 3 pt. white Mackinac blankets, to measure 60 by 72 inches, and weigh 8 pounds.
1,600 pairs 2½ pt. white Mackinac blankets, to measure 54 by 66 inches, and weigh 6 pounds.
2,700 pairs 3 pt. scarlet Mackinac blankets, to measure 60 by 72 inches, and weigh 8 pounds.
2,400 pairs 2½ pt. scarlet Mackinac blankets, to measure 54 by 66 inches, and weigh 6 pounds.
250 pairs 2 pt. scarlet Mackinac blankets, to measure 42 by 46 inches, and weigh 5¼ pounds.
2,700 pairs 3 pt. indigo blue Mackinac blankets, to measure 60 by 72 inches, and weigh 8 pounds.
1,550 pairs 2½ pt. indigo blue Mackinac blankets, to measure 54 by 66 inches, and weigh 6 pounds.
1,000 yards fancy list blue cloth.
10,000 yards saved list blue cloth.
7,000 yards saved list scarlet cloth.
175 dozen 3 by 4 plaid woolen shawls.
210,000 yards 64 square standard prints.
50,000 indigo blue drilling, (best quality.)
25,000 yards ⅞ good ticking.
10,000 yards indigo and gray mixed satinets.
6,000 yards hickory shirting.
180,000 yards standard brown sheeting, 4-4.
10,000 yards heavy cotton duck, (for tents.)
18,000 yards linsey.
25,000 yards heavy blue twilled flannel.
27,000 yards heavy red twilled flannel.
8,000 hickory shirts.
12,000 red flannel shirts.
1,350 dozen men's heavy wool socks.
575 dozen women's heavy wool hose.
500 dozen children's heavy wool hose.
800 dozen plaid cotton handkerchiefs, (large.)
8,500 pounds of yarn, assorted colors.
800 dozen standard make, six-cord spool cotton, 200 yards, white or black.
800 dozen standard make, three-cord, enameled spool cotton, 200 yards, white or black.
1,000 pounds linen thread, standard Nos. 25 and 30.
4,000 men's coats.
4,000 men's pants.
800 pairs men's shoes.
400 pairs women's shoes.
200 pairs children's shoes.
5,000 hats, either black or gray felt, black wool, or military.
220 dozen cast-steel axes, 3 to 3½ pounds.
170 dozen cast-steel half axes, 2 to 3 pounds.
1,500 tinned iron kettles, 4, 6, 8 quarts.
4,000 fry-pans, usual size for Indians.
400 dozen tin-pans, pressed, 2, 4 and 6 quarts.
500 dozen iron table spoons.
850 dozen tin cups, pints.
1,300 dozen butcher-knives, cast-steel, 6-inch blade, ebony handles.
150 dozen tin pails, 6 to 12 quarts, no covers.
90 dozen hoes.
300 dozen tin plates.
330 dozen ax handles.
170 dozen half-ax handles.
20,000 pounds tobacco.

Parties bidding are required to furnish a sample of each article bid for. The prices must be given without any modification or proposed modification whatever.

The right will be reserved to require none or a greater or less quantity of any of the articles than that specified in the above list, at the prices proposed.

All bids for furnishing said articles may be rejected at the option of the Government.

All articles furnished under contract will be rigidly inspected and compared with the samples, by an agent or agents appointed for that purpose. Such goods or articles as may in any respect fail to conform to the samples will be rejected, and in that case the contractor will be bound to furnish others of the required kind or quality within five days; or, if that is not done, they will be purchased at his expense.

Payments will be made for goods received on invoices thereof, certified by the agent or agents appointed to inspect them.

No bids will be considered from persons who have failed to comply with the requirements of a former contract.

No proposals will be considered that do not strictly comply with the following form:

"I (or we) hereby propose to furnish the Indian Department, according to the terms of the advertisement of the Commissioner of Indian Affairs, dated July 29, 1870, the following articles, at the prices thereto affixed. [Here insert the list of articles proposed to be furnished.] Said articles are to be delivered in New York on or before the 20th day of August next. And if this proposal be accepted, I (or we) will, within five days thereafter, execute a contract accordingly, and give security satisfactory to the Commissioner of Indian Affairs for the faithful performance of the same."

Each proposal must be accompanied by a guarantee in the following form, to be signed by two responsible persons, whose sufficiency must be certified by a United States judge or district attorney:

"We hereby, jointly and severally, guarantee that the above bidder, (or bidders,) if a contract shall be awarded to him, (or them,) according to his (or their) bid or proposal, will execute a contract accordingly, and give the requisite security for the faithful performance of the same, as prescribed in the advertisement for proposals for Indian goods, dated July 29, 1870; and in the event of his (or their) failure so to do, we hereby agree and bind ourselves, our heirs, executors, and administrators, to forfeit and pay to the United States, as damages, a sum not less than 15 per cent. on the amount of said bid or proposal."

Bonds will be required in the amount of the bid for the faithful performance of the contract, with two or more sureties, whose sufficiency must be certified to by a United States judge or district attorney.

E. S. PARKER,
Commissioner of Indian Affairs.

Schedule of prices to be paid Hiram K. Hazlett, contractor, for the transportation of officers, soldiers, military, Indian, and Government supplies, horses, mules, cattle, wagons, ambulances, and carts, under an agreement between Brevet Major General D. H. Rucker, Assistant Quartermaster General United States Army, acting on behalf of the United States, and the said Hiram K. Hazlett, dated at Chicago, Illinois, February 17, 1870.

Bvt. Maj. Gen'l, Asst. Q. M. Gen'l U. S. Army.
GEO. K. HAZLETT

Contract for the transportation of Government troops and supplies from Chicago, Illinois, to posts on the Upper Missouri River, commencing March 20 and ending October 31, 1870, inclusive.

This agreement, made and entered into this 16th day of February, 1870, by and between Brevet Major General D. H. Rucker, Assistant Quartermaster General United States Army, for and on behalf of the United States, of the first part, and George K. Hazlett, of Cincinnati, Ohio, of the second part, his heirs, executors and administrators, witnesseth: That the said parties have covenanted and agreed, and by these presents do covenant and agree to and with each other, viz:

ARTICLE I. That the said George K. Hazlett shall furnish, at any time from March 20 to October 31, 1870, all the transportation required by the United States Government for officers and soldiers from Chicago, Illinois, via and so far as Sioux City, Iowa, by rail, thence by river to the posts or Indian agencies (above that place on the Missouri River) mentioned in the tabular statement hereto annexed, and shall receive at any time from March 20, 1870, to October 31, 1870, inclusive, from the officer or agent of the Quartermaster's Department at Chicago, Illinois, all such military, Indian or Government stores, supplies, wagons and stock, as may be offered or turned over to him for transportation, in good order and condition, by said officer or agent of the Quartermaster's Department, and transport the same with dispatch by railroad to Sioux City, Iowa, and thence by river, and deliver them in like good order and condition to the officer or agent of the Quartermaster's Department designated to receive them, at Yankton agency, Fort Randall, Whetstone, Lower Brulés and Crow Creek agencies, Fort Sully, Big Cheyenne and Grand River agencies, Forts Rice, Stevenson, Buford, Dakota Territory; Camp Cooke and Fort Benton, Montana Territory, on the Missouri River; all stores, supplies, wagons and stock, to be delivered at their destination within the year 1870. It being expressly understood that the contractor shall furnish the required transportation from Chicago, Illinois, to any post, station or Indian agency that may be established on the Missouri River between Sioux City, Iowa, and Fort Benton, Montana Territory, at the same rate per mile as from Chicago, Illinois, to the post, station or Indian agency named in this agreement, nearest the point of delivery; the distances in all cases to be determined by the chief quartermaster Military Division of the Missouri; and for the faithful performance of such service he shall be paid in the manner hereinafter provided in article 8 of this agreement, and at the rates specified and shown in the tabular statement and remarks or memoranda hereto annexed, as signed by the parties to this agreement, which statement and remarks or memoranda are considered a part hereof.

ARTICLE II. That the said George K. Hazlett agrees and binds himself, his heirs, executors, and administrators to transport under this agreement, from Chicago, Illinois, to any of the posts, stations or Indian agencies above Sioux City, Iowa, named or referred to in article 1 of this agreement, any number of pounds of stores and supplies from and between 100,000 pounds and 20,000,000 pounds in the aggregate, and in no case to carry private freight or stock to the exclusion of that belonging to the government.

ARTICLE III. That the said George K. Hazlett agrees and binds himself, his heirs, executors, and administrators, to transport military, Indian, and Government stores, supplies and wagons, by land, from Sioux City, Iowa, to posts or Indian agencies, above mentioned or referred to in annexed tabular statement, or in article 1 of this agreement, in the event of failure by river, without any additional charge to the United States Government, but at the rates specified in the annexed tabular statement, and remarks or memoranda above referred to, or indicated in article 1 of this agreement; a sufficient guard to be furnished by the Government when required to protect stores, supplies or wagons, while in transitu overland, by application of contractor or his agent to the commanding officer of the nearest military post.

ARTICLE IV. That the said George K. Hazlett agrees and binds himself to furnish such steamboats only as shall conform to the requirements of the St. Louis (Mo.) board of underwriters, and as shall be safe and satisfactory to the quartermaster in charge of transportation at Sioux City, Iowa; shall provide officers with cabin passage from Sioux City, upward, allowing one hundred pounds of baggage to each, free of charge, and that the steamboats shall be furnished with kitchen-room and cooking-stoves, and all proper accommodations for the use of such troops as may be transported, 80 pounds of baggage to be allowed each soldier, free of charge; also, that the said steamboats shall be provided with troughs and proper conveniences for transporting and feeding horses, mules and cattle, 180 pounds being allowed for each, free of charge; it being expressly understood that no boat loaded with Government property will be allowed to go above Sioux City, Iowa, drawing over 3½ feet of water; and that no boat will be required to go above Sioux City with less than 100 tons of freight.

ARTICLE V. That it shall be the duty of George K. Hazlett, during the time that he shall be absent from Chicago, Ill., to designate and keep an agent at said place, and said George K. Hazlett, or in his absence from Chicago, Ill., his agent, shall be notified when

Government transportation is required; and in order that the said George K. Hazlett shall be in readiness to meet the demands and requirements made upon him for transportation under this contract or agreement, five days' written notice shall be given him or his agent of the quantity and kinds of stores to be transported at any one time, at what time the stores will be ready for delivery to him, and the place of their destination; it being expressly understood that no Government or Indian stores will be allowed to remain longer than ten days at Sioux City, Iowa, while in transitu under this agreement. And in case the said George K. Hazlett fails to furnish the transportation required by the United States Government, the quartermaster in charge of transportation at Chicago, Ill., or Sioux City, Iowa, may furnish the same, and charge the said George K. Hazlett for any expense incurred by the Government in excess of the rates herein provided.

ARTICLE VI. The military, Indian, and Government stores, supplies, wagons and stock which shall be transported under this agreement, shall be consigned to their respective destinations, and receipts on through bills of lading shall be given by the officer of the Quartermaster's Department serving at the place of consignment, for the full quantity of stores and supplies, and number of wagons and stock that shall be delivered; officers and soldiers shall be furnished with transportation orders, the certificates on which to be signed by them when the transportation shall have been furnished; and upon such receipts, payment shall be made to the said George K. Hazlett, as hereinafter provided; also, demurrage to be allowed boats for all unusual or unnecessary detention while en route, provided such detention is caused by proper military order in writing; bills of lading to contain the usual exceptions of the dangers of navigation and fire.

ARTICLE VII. In all cases when stores, supplies and stock have been transported by the said George K. Hazlett, under this agreement, a board of survey, to be applied for in writing by the contractor or his agent, (one member of which board shall be, when practicable, an officer on duty in the Subsistence Department,) shall be called without delay, on their arrival at the point of destination or delivery, to examine the quantity and condition of the property transported, and in case of loss, deficiency or damage, to investigate the facts and report the apparent causes, assess the amount of loss, deficiency or damage, and state whether it was attributable to neglect or want of proper care on the part of the contractor, or to causes beyond his control; and these proceedings, a copy of which shall be furnished to the contractor, shall be attached to the bill of lading, and shall govern the payments to be made on it. Should no board of survey be called when requested by the contractor, through failure on the part of the Quartermaster's Department, or other military authority, to have one convened, the indorsement of the receiving officer on the bill of lading shall alone govern its payment. But before such payment is made, the fact must be shown that the contractor, or his agent, did make application in writing to the quartermaster or receiving officer for a board of survey. If the amount of loss, deficiency or damage, exceeds the value of the bill of lading, it shall be deducted from any payments due or that may become due afterward.

In all cases when the full amount of stores, supplies or stock, is not delivered in accordance with the bill of lading, three times the cost price of the stores, supplies or stock deficient, together with the actual cost of the transportation of same from place of purchase to the point at which they were turned over to the said George K. Hazlett, shall be charged to him; it being understood that such charges apply only to deficiency (attributable to the fault of contractor) in the amount of stores, supplies or stock, delivered, and not to any damage of stores, supplies or stock, actually delivered at their destination—the assessment of such damage to be made by a board of survey, as above provided in this article.

ARTICLE VIII. For and in consideration of the faithful performance of the stipulations of this agreement, the said George K. Hazlett shall be paid at the office of the Quartermaster's Department at Chicago, Illinois, in the legal currency of the United States, agreeably to the rates specified in the tabular statement, remarks or memoranda hereto annexed, signed by the parties to this agreement.

ARTICLE IX. It is expressly understood that no member of Congress, officer, agent, or employé of the Government shall be admitted to any share or part in this contract or agreement, or derive any benefit to arise therefrom.

ARTICLE X. This contract is made subject to the approval of the commanding general of the Military Division of the Missouri.

In witness whereof, the undersigned have hereunto placed their hands and seals, at Chicago, the day and date first above written.

D. H. RUCKER,
Brevet Major General, Assistant Quartermaster General U. S. A.
GEORGE K. HAZLETT.

Witnesses:
GEO. FRANCIS NELSON,
WILLIAM H. MOWRY.

Contract for Missouri River, commencing March 20 and ending October 31, 1870, inclusive.

This agreement, made and entered into this 17th day of February, 1870, by and between Brevet Major General D. H. Rucker, Assistant Quartermaster General United States Army, for and on behalf of the United States, of the first part, and Hiram K. Hazlett, of St. Louis, Missouri, of the second part, his heirs, executors, and administrators, witnesseth: That the said parties have covenanted and agreed, and by these presents do covenant and agree to and with each other, viz:

ARTICLE I. That the said Hiram K. Hazlett shall furnish all the steamboat transportation required by the United States Government for officers and soldiers on the Missouri River, from St. Louis, Missouri, Wyandotte and Fort Leavenworth, Kansas, and Omaha, Nebraska, to Sioux City, Iowa, and Fort Benton, Montana Territory, and the posts or Indian agencies between Sioux City and Fort Benton, and which are mentioned in the tabular statement hereto annexed, and from Sioux City, Iowa, Yankton agency, Fort Randall, Whetstone, Lower Brulés, and Crow Creek agencies, Fort Sully, Big Cheyenne, and Grand River agencies, Forts Rice, Stevenson, and Buford, Dakota Territory, and Camp Cooke, Montana Territory, to any or all the posts or Indian agencies that are above, each respectively, at any time from March 20, 1870, to October 31, 1870, and shall receive, at any time during said period, from the officers or agents of the Quartermaster's Department, at St. Louis, Missouri, or any point between St. Louis and Fort Benton mentioned in the tabular statement hereto annexed, all such military, Indian, and Government stores, supplies, wagons and stock as may be offered or turned over to him for transportation, in good order and condition, by said officers or agents of the Quartermaster's Department, and transport the same with dispatch, and deliver them in like good order and condition to the officer or agent of the Quartermaster's Department designated to receive them at Sioux City, Iowa, or any of the posts or Indian agencies above that point, mentioned in the annexed tabular statement; all stores, supplies, wagons and stock, to be delivered at their destination within the year 1870. It being expressly understood that the contractor shall furnish the required transportation from any of the posts, stations, or Indian agencies mentioned in this article, to any post, station, or Indian agency that may be established on the Missouri River, between Sioux City, Iowa, and Fort Benton, Montana Territory, (if any one or more of the posts or Indian agencies named in this agreement are situated between the point of departure and the point of delivery,) at the rate herein provided for transportation from the point of departure to the nearest post or Indian agency named in this agreement, below the point of delivery, added to the rate to be fixed for the additional distance from such nearest post or Indian agency to the point of delivery; the rate of such additional distance to be the same per mile as from the point of departure to the nearest post or Indian agency named in this agreement, to the point of delivery. In case, however, none of the posts or Indian agencies named in this agreement is situated between the point of departure and the point of delivery, then the transportation shall be furnished at the same rate per mile as from the point of departure to the nearest post or Indian agency named in this agreement, above the point of delivery; the distances in all cases are to be determined by the chief quartermaster Military Division of the Missouri. For the faithful performance of the above service, the contractor shall be paid in the manner hereinafter provided in article 12 of this agreement, and at the rates specified and shown in the tabular statement and remarks or memoranda hereto annexed, as signed by the parties to this agreement, which statement and remarks or memoranda are considered a part hereof.

ARTICLE II. That the said Hiram K. Hazlett agrees and binds himself, his heirs, executors, and administrators, to transport, under this agreement, from and to any of the posts, stations, or Indian agencies named or referred to in Article I of this agreement, any number of pounds of stores and supplies from and between 100,000 pounds and 20,000,000 pounds in the aggregate, and in no case to carry private freight or stock to the exclusion of that belonging to the Government.

ARTICLE III. That the said Hiram K. Hazlett agrees and binds himself, his heirs, executors, and administrators, to transport military, Indian, and Government stores, supplies, and wagons by land to Sioux City, or posts, or Indian agencies above, from St. Louis, Missouri, or any intermediate point mentioned or referred to in annexed tabular statement, or in Article I of this agreement, in the event of failure by river, without any additional charge to the United States Government, but at the rates specified in the annexed tabular statement, and remarks or memoranda above referred to, or indicated in Article I of this agreement; a sufficient guard to be furnished by the Government, when required, to protect stores, supplies, or wagons, while in transitu overland, by application of contractor or his agent to the commanding officer of the nearest military post.

ARTICLE IV. That the said Hiram K. Hazlett agrees and binds himself to furnish such steamboats only as shall be approved by the inspector or inspectors of the St. Louis, Missouri, board of underwriters, and as shall be safe and satisfactory to the quartermaster in charge of transportation at St. Louis, Missouri; shall provide officers with

cabin passage, allowing 100 pounds of baggage to each, free of charge; and that the said steamboats shall be furnished with kitchen-room and cooking-stoves, and all proper accommodations for the use of such troops as may be transported, 80 pounds of baggage to be allowed each soldier, free of charge; also be provided with troughs and proper conveniences for transporting and feeding horses, mules, and cattle, 180 pounds being allowed for each, free of charge; it being expressly understood that no steamboat will be required to go above Sioux City with less than 100 tons of freight, and that no boat loaded with Government property will be allowed to go above Sioux City, Iowa, drawing over 3½ feet of water.

ARTICLE V. That it shall be the duty of said Hiram K. Hazlett, during the time that he shall be absent from St. Louis, Missouri, to designate and keep an agent at said place, and said Hiram K. Hazlett, or, in his absence from St. Louis, Missouri, his agent, shall be notified when Government transportation is required at either of the points mentioned or referred to in Article I of this agreement; and in order that the said Hiram K. Hazlett shall be in readiness to meet the demands and requirements made upon him for transportation under this contract or agreement, due written notice shall be given him or his agent of the quantity and kind of stores to be transported at any one time, at what time the stores will be ready for delivery to him, and the place of their destination; that is to say, five days' notice when transportion is required at St. Louis, Missouri; five days' notice when transportation is required at Wyandott, Kansas; eight days' notice when transportation is required at Fort Leavenworth, Kansas; ten days' notice when transportation is required at Omaha, Nebraska; ten days' notice when transportation is required at Sioux City, Iowa; fifteen days' notice when transportation is required at Fort Randall, Dakota Territory; twenty days' notice when transportation is required at Fort Sully, Dakota Territory; twenty-five days' notice when transportation is required at Fort Rice, Dakota Territory; thirty-five days' notice when transportation is required at Fort Stevenson, Dakota Territory; forty days' notice when transportation is required at Fort Buford, Dakota Territory; and fifty days' notice when transportation is required at Camp Cooke, Montana Territory. And in case the said Hiram K. Hazlett fails to furnish the transportation required by the United States Government, the quartermaster in charge of transportation at any of the aforesaid posts or stations may furnish the same, and charge the said Hiram K. Hazlett for any expense incurred by the Government in excess of the rates herein provided.

ARTICLE VI. The military, Indian, and Government stores, supplies, wagons, and stock which shall be transported under this agreement, shall be consigned to their respective destinations, and receipts on bills of lading shall be given by the officer of the Quartermaster's Department serving at the place of consignment for the full quantity of stores and supplies and number of wagons and stock that shall be delivered; officers and soldiers shall be furnished with transportation orders, the certificates on which to be signed by them when the transportation shall have been furnished; and upon such receipts payment shall be made to the said Hiram K. Hazlett as hereinafter provided; also demurrage to be allowed boats for all unusual or unnecessary detention when en route, provided such detention is caused by proper military order in writing; bills of lading to contain the usual exceptions of the dangers of navigation and fire.

ARTICLE VII. In all cases when stores, supplies, and stock have been transported by the said Hiram K. Hazlett, under this agreement, a board of survey, to be applied for in writing by the contractor or his agent, (one member of which board shall be, when practicable, an officer on duty in the Subsistence Department,) shall be called without delay, on their arrival at the point of destination or delivery, to examine the quantity and condition of the property transported, and in case of loss, deficiency, or damage, to investigate the facts and report the apparent causes, assess the amount of loss, deficiency, or damage, and state whether it was attributable to neglect or want of proper care on the part of the contractor, or to causes beyond his control; and these proceedings, a copy of which shall be furnished to the contractor, shall be attached to the bill of lading, and shall govern the payments to be made on it. Should no board of survey be called when requested by the contractor, through failure on the part of the Quartermaster's Department or other military authority to have one convened, the indorsement of the receiving officer on the bill of lading shall alone govern its payment. But before such payment is made the fact must be shown that the contractor or his agent did make application in writing to the quartermaster or receiving officer for a board of survey. If the amount of loss, deficiency, or damage exceeds the value of the bill of lading, it shall be deducted from any payments due or that may come due afterward. In all cases when the full amount of stores, supplies, or stock is not delivered in accordance with the bill of lading, three times the cost price of the stores, supplies, or stock deficient, together with the actual cost of the transportation of same from place of purchase to the point at which they were turned over to the said Hiram K. Hazlett, shall be charged to him; it being understood that such charges apply only to deficiency (attributable to the fault of contractor) in the amount of stores, supplies, or stock delivered, and not to any damage of stores, supplies, or stock actually delivered at their destination; the assessment of such damage to be made by a board of survey, as above provided in this article.

ARTICLE VIII. It is understood that the Government will, whenever it is deemed advisable, contract for forage, to be delivered at Sioux City, Iowa, and Fort Benton, Montana Territory, or any post, station, or Indian agency between Sioux City and Fort Benton, mentioned in the tabular statement hereto annexed, or at any post, station, or Indian agency that may be established between Sioux City and Fort Benton.

ARTICLE IX. It is understood that nothing herein contained shall be so construed as to prevent the United States Government from transporting troops, or public property of any kind, on any boat belonging to the Government.

ARTICLE X. It is expressly understood that nothing herein contained shall be so construed as to prevent the United States from transporting public or Indian stores, supplies, wagons, horses, mules, or cattle, on through bills of lading, or from transporting troops from Chicago, Ill., to posts on the Missouri River, above Sioux City, Iowa, mentioned or referred to in annexed tabular statement, or in Article I, of this agreement, and thereby using other steamboats than those in the interest of said Hiram K. Hazlett.

ARTICLE XI. It is understood that if, at any time from March 20 to October 31, 1870, inclusive, troops, stores, supplies, wagons, or stock are required to be transported down stream from Fort Benton, M. T., or from any post or station between Fort Benton and St. Louis, mentioned in annexed tabular statement, to St. Louis, or from and to any point between Fort Benton and St. Louis, they shall be carried on the same terms and conditions herein provided for up-stream transportation; provided always, that the said Hiram K. Hazlett shall not be compelled to send a steamboat up stream for this exclusive purpose, unless to bring down at least one hundred and sixty tons of freight.

ARTICLE XII. For and in consideration of the faithful performance of the stipulations of this agreement, the said Hiram K. Hazlett shall be paid at the office of the Quartermaster's Department at St. Louis, Mo., in the legal currency of the United States, agreeably to the rates specified in the tabular statement, remarks or memoranda hereto annexed, signed by the parties to this agreement.

ARTICLE XIII. It is expressly understood that no member of Congress, officer, agent. or employé of the Government shall be admitted to any share or part in this contract or agreement, or derive any benefit to arise therefrom.

ARTICLE XIV. This contract is made subject to the approval of the Commanding General of the Military Division of the Missouri.

In witness whereof, the undersigned have hereunto placed their hands and seals, at Chicago, Ill., the day and date first above written.

GRAND RIVER AGENCY, D. T., *October* 2, 1870.

Received in good order and condition from steamer Huntsville the above Indian supplies.

J. A. HEARN,
Captain U. S. Army, Indian Agent.

Know all men by these presents:

That Charles D. Woolworth, secretary Northwest Transportation Company, as principal, and Joab Lawrence and Gholeson G. Russell as sureties, are firmly bound to the United States in the sum of fifty thousand dollars, the same to be well and truly paid to the Commissioner of Indian Affairs of the United States, or his successor in office.

The condition of the above obligation is as follows: That whereas the said bonded Charles D. Woolworth, secretary Northwest Transportation Company, has entered into a contract with the Commissioner of Indian Affairs, dated September 26, 1870, agreeing to transport certain Indian supplies for the year one thousand eight hundred and seventy. Now, in case said contract is well and truly filled as therein set forth, then this obligation to be null and void, otherwise to remain in full force and effect.

Witness our hands and seals the day and year above written.

CHARLES D. WOOLWORTH, [SEAL.]
Secretary Northwest Transportation Company.

Witnesses:
GEORGE K. HAZLETT.
JAMES P. CHARLES.

JOAB LAWRENCE. [SEAL.]

GHOLESON G. RUSSELL. [SEAL.]

Articles of Agreement

Made and entered into this 26th day of September, 1870, by and between E. S. Parker, Commissioner of Indian Affairs, for and on behalf of the United States of the first part, and the Northwest Transportation Company, by Charles D. Woolworth, its secretary, of Sioux City, Iowa, witnesseth:

That said parties have agreed, and do hereby covenent and agree, to and with each other, in the manner following, to wit: The Northwest Transportation Company agrees to transport from Sioux City, Iowa, to the following-named and described places, at the following-named and described rates, all the goods and supplies of the Indian Department for the year 1870, of whatsoever kind; and in case the river is so low that the freight cannot be delivered by boat, the said party of the second part agrees to transport said goods by wagons, to wit: From Sioux City, Iowa, to Ponca, Santee, and Yankton agencies, at two dollars and twenty-five cents per hundred pounds. From Sioux City to Brulé and Crow Creek agencies, at four dollars and twenty-five cents per hundred pounds. From Sioux City to Whetstone agency, at three dollars and twenty-five cents per hundred pounds. From Sioux City to Cheyenne agency, at five dollars and twenty-five cents per one hundred pounds. From Sioux City to Grand River, at six dollars and twenty-five cents per hundred pounds. From Sioux City to Fort Berthold agency, at seven dollars and fifty cents per hundred pounds.

In consideration of the faithful performance of this arrangement on the part of the party of the second part, they, or their representatives, shall be paid at the office of the Commissioner of Indian Affairs, at Washington, D. C., on the presentation of the receipted bills of lading, signed by the respective agents or their substitutes, as above enumerated.

In witness whereof the parties hereunto have hereto set their hands and seals the day and date above written.

E. S. PARKER,
Commissioner of Indian Affairs.

Signed in presence of
S. M. WINSHIP,
S. M. JONES.

CHARLES D. WOOLWORTH, [SEAL.]
Secretary Northwest Transportation Company.

TREASURY DEPARTMENT,
Second Auditor's Office, January 21, 1871.

I certify the foregoing to be true copies of the originals filed in this office.

E. B. FRENCH,
Second Auditor.

No 1.

JULY, 1870.

THE UNITED STATES

To JAMES W. BOSLER, DR.

1870.—For the following supplies furnished the Ponca Indians:

20,000 pounds of flour, at 6½ cents per pound	$1,300 00
863 pounds of tobacco, at 85 cents per pound	733 55
	2,033 55

Received, Ponca Agency, July, 1870, of J. W. Bosler, the following supplies:
20,000 pounds of flour, and 863 pounds of tobacco.

The above supplies received in accordance with instructions from the Commissioner Indian Affairs, by telegraph to J. W. Bosler, dated July 5, 1870.

WM. H. HUGO,
First Lieutenant United States Army, Indian Agent.

TREASURY DEPARTMENT,
Second Auditor's Office, January 7, 1871.

certify the foregoing to be true copies of the originals filed in this office.

E. B. FRENCH,
Second Auditor

No. 2.

JULY 7, 8, 10, 11, and 15, 1870.

THE UNITED STATES

To J. W. BOSLER, DR.

July 8, 1870.—To the following supplies furnished for the Indian service at the Whetstone agency, Dakota Territory, for Sioux Indians:

5,340 pounds soap, at 15 cents	$801 00
18,975 pounds coffee, at 28 cents	5,313 00
2,100 pounds tobacco, at 85 cents	1,785 00
32,685 pounds sugar, at 18 cents	5,883 30
189,200 pounds flour, at 6¼ cents	11,825 00
48,039 pounds bacon, at 25 cents	12,009 75
3,640 pounds salt, at 8 cents	291 20
	37,908 25

WHETSTONE AGENCY, D. T., *July* 8, 1870.

Received from J. W. Bosler the following articles of subsistence stores, viz:

	Pounds, net.
89 boxes soap	5,340
115 sacks coffee	18,862½
18 boxes tobacco	2,100
148 pounds sugar	32,685
1,892 sacks flour	189,200
270 sacks bacon	45,328
13 barrels salt	3,640

DEWITT C. POOLE,
Captain United States Army, Indian Agent.

Twenty-eight sacks of flour, unfit for issue to Indians, delivered by J. W. Bosler, and held in store subject to his order.

WHETSTONE, D. T., *July* 18, 1870.

Captain Poole being absent, error in several of the articles herein-mentioned, supposed to have occurred in deducting gross weight from net weight, as furnished per invoices from Mr. Bosler—Mr. Bosler claiming that nothing but *net* weights were furnished, making a difference of 112½ pounds coffee, 2,711 pounds bacon, to be added to this receipt.

S. F. ESTES, *Acting Agent.*

THE UNITED STATES

To J. W. BOSLER, DR.

Salt	1,800
Soap	1,920

The above supplies are all in good order, and of good quality.

L. H. ROBERTS, *M. D.*,
Physician Cheyenne Agency, and Acting Indian Agent.

This is to certify that Dr. L. H. Roberts, physician to the Indian agency at this place, has been appointed by Brevet Major George M. Randall, Indian agent at this place, to act in his absence on official business at Washington, as Indian agent; that Brevet Major Randall is so absent at this date, and that Mr. J. W. Bosler has delivered

at this agency a large quantity of stores, which Doctor Roberts informs is in amount as stated above.

E. P. PEARSON, JR.,
Captain Seventeenth Infantry, Brevet Lieutenant Colonel U. S. Army,
Commanding Detachment.

[Special Orders No. 2.]

CHEYENNE AGENCY, D. T., *June* 25, 1870.

Doctor L. H. Roberts will attend to all duties appertaining to this agency, as Indian agent, during the temporary absence of Brevet Major George M. Randall, Indian agent, on official business at Washington, D. C.

GEO. M. RANDALL,
Captain and Brevet Major U. S. Army, Indian Agent.

No. 139.] CHICAGO, *September* 26, 1870.

I hereby certify to having examined all of lot 1,003 sacks clear rib bacon sides; branded Major J. A. Hearn, Grand River agency, D. T., contained in J. L. Hancock's house, Chicago, Illinois, with results as follows:

1,003 sacks clear rib bacon sides, weighing 180,174 pounds.

All sweet and in good order.

Marked, Major J. A. Hearn, Grand River agency, D. T., account E. S. Parker, Comsioner Indian Affairs.

EZRA TAYLOR,
Inspector Pork-Packers' Association.

Inspecting charges, $45.

No. 141.] CHICAGO, *September* 30, 1870.

I hereby certify to having examined all of lot 358 sacks clear rib bacon sides, branded Major Geo. M. Randall, Cheyenne agency, contained in J. L. Hancock's house, with results as follows:

358 sacks clear rib bacon sides, weighing 70,027 pounds.

All sweet and in good order.

Marked, Major Geo. M. Randall, Cheyenne agency, D. T., in account with E. S. Parker, United States Commissioner of Indian Affairs.

EZRA TAYLOR,
Inspector Pork-Packers' Association.

Inspection charges, $17 50.

No. 148.] CHICAGO, *October* 3 *and* 5, 1870.

I hereby certify to having examined all of lot 719 sacks clear rib bacon sides, branded Major De Witt C. Poole, Whetstone agency, D. T., contained in John L. Hancock's house, with result as follows:

719 sacks clear rib bacon sides, weighing 140,137 pounds.

All sweet and in good order. Consigned to Maj. De Witt C. Poole, Whetstone agency, D. T. Account E. S. Parker, United States Commissioner of Indian Affairs.

EZRA TAYLOR,
Inspector Pork-Packers' Association.

Inspection charges, $35.

No. 149.] CHICAGO, *October* 5, 1870.

I hereby certify to having examined all of lot 355 sacks clear rib bacon sides, branded Capt. W. H. French, jr., Crow Creek agency, contained in J. L. Hancock's house, with result as follows:

355 sacks clear rib bacon sides, weighing 70,007 pounds.

All sweet and in good order. Consigned to Capt. W. H. French, jr., Crow Creek agency, D. T. Account E. S. Parker, United States Commissioner of Indian Affairs.

EZRA TAYLOR,
Inspector Pork-Packers' Association.

Inspection charges, $17 50.

No. 150.] CHICAGO, *October* 7, 1870.

I hereby certify to having examined all of lot 355 sacks clear rib bacon sides, branded Major J. M. Goodhue, Yankton agency, D. T., contained in J. L. Hancock's house, with result as follows:

355 sacks clear rib bacon sides; weight, 70,388 pounds.

All sweet and in good order.

Consigned to Major J. M. Goodhue, Yankton, D. T., account of E. S. Parker, United States Commissioner Indian Affairs.

EZRA TAYLOR,
Inspector Pork-Packers' Association.

Inspection charges, $17 50.

WASHINGTON, D. C., *October* 14, 1870.

SIR: Inclosed please find account of bacon delivered to Indian Bureau, 530,733 lbs., at 18 cents, amounting to $95,531 94; also, inspection certificate of Ezra Taylor, and receipts of T. C. Hatch, agent Chicago and Northwestern Railway Company, for shipment of the same. Hatch's receipts, you will notice, are in name of John L. Hancock and Cragin & Co. These are the houses from which I purchased the bacon, and who attended to shipping the same for me; consequently the railroad company's receipts were made out in their names.

Have the amount paid to me in draft on New York.

Very respectfully,

J. W. BOSLER.

Hon. E. S. PARKER,
Commissioner of Indian Affairs.

DEPARTMENT OF THE INTERIOR,
OFFICE OF INDIAN AFFAIRS,
Washington, D. C., October 19, 1870.

SIR: I am in receipt of your letter of the 18th instant, requesting to be informed whether Mr. Bosler furnished the bacon, for which an account was stated in his favor on the 14th instant, by contract, and whether the United States agreed to pay inspector's charges.

In reply I have to say, that the contract entered into with Mr. Bosler has this day been forwarded to the Second Comptroller for file in his office.

By the terms of the contract, the contractor was to deliver the bacon at Chicago, Illinois, and arrangements were made by this Bureau to have the supplies inspected at Government expense.

Very respectfully, your obedient servant,

H. R. CLUM, *Acting Commissioner.*

Hon. E. B. FRENCH,
Second Auditor Treasury, Washington, D. C.

TREASURY DEPARTMENT,
Second Auditor's Office, January 7, 1871.

ARGUMENT OF MR. WELSH.

WASHINGTON, D. C., *February* 15, 1871.

To the Sub-Committee of the Committee on Appropriations, charged with the investigation of wrong-doing in the Indian Office:

GENTLEMEN: The duty that devolves on me of summing up the voluminous and somewhat contradictory testimony in the case under consideration is easy, because the law bearing on the subject is clear—the leading facts are substantiated by documentary testimony, and the United States Government has decreed that the market value of merchandise and of transportation is to be ascertained "by advertising a sufficient time previously, for proposals respecting the same." You certainly have shown consideration to Commissioner Parker, by allowing him to be represented by counsel, by giving him ample time to prepare his case, by summoning at his instance interested witnesses, and by listening patiently to their testimony.

To avoid repetition, I will condense my "statement of misconduct in the Indian Office," that you forwarded to Commissioner Parker more than a month since:

First, by uniting charges 1, 2, 5, and 8.
Second, " charges 3 and 4.
Third, " charges 6 and 11.
Fourth, charge 9.
Fifth. charge 12.
Sixth. charges 7 and 10.

I am prepared to furnish proofs of the 13th charge; but it was deemed best to defer it, that the committee might report at this session of Congress.

First. The law of March 2, 1861, section 10, contains this clause: "No contract or purchase shall hereafter be made, unless the same be authorized by law or be under an appropriation adequate to its fulfillment, except in the War and Navy Departments, for clothing, subsistence, forage, fuel, quarters, or transportation, which, however, shall not exceed the necessities of the current year." It appears from the evidence that the Commissioner of Indian Affairs did, in violation of this law, purchase, on the 17th of June, 1870, beef, flour, bacon, coffee, sugar, tobacco, soap, and salt, for which he paid the sum of $395,248 37. Although the War and Navy Departments are authorized to purchase supplies for public exigencies requiring an immediate delivery of the article, yet the other Departments are expressly prohibited from making contracts or purchases unless authorized by law. The importance of this prohibition is most apparent, for if the under officers in the several governmental Departments, or if the heads of those Departments themselves were warranted in determining what are exigencies, and meeting them by large contracts at extravagant rates by reason of anticipating an appropriation, the finances of the Government would soon be hopelessly embarrassed.

Another restrictive clause will be found in the law of March 2, 1861, section 10, as follows:

"*And be it further enacted*, That all purchases and contracts for supplies or services in any of the Departments of the Government, except for personal services, when the public exigencies do not require the immediate delivery of the article or articles, or performance of the service, shall be made by advertising a sufficient time previously for proposals respecting the same. When immediate delivery or performance is required by the public exigency, the articles or service required may be procured by open purchase or contract at the places and in the manner in which such articles are usually bought and sold or such services engaged between individuals."

It appears from the evidence that in the region of the Missouri River alone, one million forty-two thousand eight hundred and forty-six dollars and sixty-five cents were expended by the Commissioner of Indian Affairs for supplies and services under very private contracts, without advertising previously for proposals respecting the same. It seems hardly necessary to consider whether there was any exigency requiring immediate delivery of articles before July 15, 1870, when the appropriation bill became a law, as the Interior Department is expressly prohibited from meeting such an exigency, and this is well known at the Department, as is shown by the following extract from the testimony of ex-Secretary Cox, and by an extract from a letter from Secretary Delano:

"In emergencies where there was danger of an outbreak, or where there was danger

of starvation, I should regard it as within the power of the President to do what might be necessary to avoid an occurence of that kind. As for instance I remember a case in which the ——— Indians were supplied for a considerable period by the Army directly on the President's order, for the purpose of preventing destitution and starvation among them, where there was no other provision. And there has always been, as I have understood the action of the Indian Bureau, more or less of that kind of provision against temporary emergencies. * * * I simply want to say that a discretion of that kind had to be used occasionally, and I think it is within the discretionary power of the President at a time like that to save what he considers a calamity."

Secretary Delano, in his letter of January 25th, printed in the Congressional Globe of the 27th, says:

"An arrangement has been made with the Secretary of War to advance from subsistence stores immediate relief for Red Cloud and his confederates. This is done because the appropriation cannot be obtained in time to meet the urgent demand for assistance for these Indians; but the appropriation will enable us to reimburse the War Department and continue such assistance as may be necessary to preserve our present friendly relations with Red Cloud."

If in the case under consideration the Commissioner of Indian Affairs had applied to the President, he would undoubtedly have ordered the War Department to continue their supplies to these Indians, until they could be fed from appropriations made by Congress. These Indians had been fed by the Commissary Department for the year ending June 30, 1870, and all that Department needed was authority from the President to continue to feed them as hitherto. On the 27th of May, 1870, the Commissary General, by letter, advised the Commissioner of Indian Affairs that there would be surplus supplies of provisions beyond what was necessary to feed the Indians to June 30, and asked the Commissioner to instruct the Indian agents to receive such supplies as were contracted for. On June 1 Commissioner Parker issued the necessary order, but from his testimony it appears that he took no pains to ascertain the surplus stock that was likely to be furnished the agents under his instructions of June 1:

"Question. What means before the 17th of June did you take to ascertain the amount of surplus supplies which would be turned over to agents?

"Answer. I took none in particular that I am aware of. That letter of the Commissary General, which is printed, was the first intimation I had that there would be a surplus of stores."

As the Indian agents had been receiving their supplies from week to week from the Commissary Department, they were naturally and very properly urgent that adequate supplies should be placed within reach. On the 22d of June Captain Poole, the agent at Whetstone, learned at Sioux City that the Commissary Department had a surplus of 1,300 oxen which they desired to hand over to the Indian Department. He therefore telegraphed the Commissioner of Indian Affairs that he had a supply sufficient for three months at the Whetstone agency. This fact should have been ascertained at Washington long before, and directions given to have the surplus cattle distributed among the various agencies, which the contractor was bound to do under the existing obligation. This supply, with the stock on hand at the various agencies, would have sufficed until near the close of August, when supplies could have been ready if the usual means had been taken, as is indicated in the following extract from the testimony of Ex-Secretary Cox:

"The Indian Bureau has always been in the habit of making purchases, as I have understood it, when it was understood that the appropriation bill was prepared by the committee. They have made, if not direct contracts, they have made conditional contracts at different times, with the understanding that if the appropriation bill passed they could then call upon parties to act, in order to get them out speedily. That I remember having brought to my attention as having been the long-time practice among them, from the fact that when we began in March, 1869, there were arrangements already made for goods being purchased. I interfered and stopped some of these; I canceled contracts, and there was some trouble about it at the time, but it was then shown to me, and I think has been undisputably the fact that, in order to meet the times of transportation on the river and to get the goods out in time, there has been embarrassment constantly growing out of the fact of the lateness of the time of passing appropriations, and it has become the custom to make that kind of provisional arrangement that if the bill passed they would be required to furnish certain supplies; and if not, they would not."

As this so-called exigency had been known for a twelve-month, and as the absence of provisions is more alarming than a delay in providing new clothing, it is wholly unaccountable that an advertisement for bids was not made in the month of May, that the Texas cattle dealers might have been allowed to compete, and thus to have reduced the cost of cattle by saving the profits of the intermediate contractor. It is in evidence that the cattle to supply the first Bosler contract were purchased at Abilene, (in Nebraska,) a large market resorted to by cattle-drovers from Texas, and from

which oxen can be driven in twenty days to the Yankton or Whetstone agencies. The contract of June 17 shows that there was no public exigency requiring the immediate delivery of any large number of cattle, as the contractor was only bound to deliver one-third in July, and the remainder in August and September. The contract of August 10 is wholly unaccountable, and Commissioner Parker, on the 13th of July, wrote to Governor Burbank, the superintendent of Indian affairs in Dakota Territory, thus: "He (Captain Poole) should advise the Indians belonging to the Whetstone agency of the fact that all these cattle are intended for them, that they must last them six months at the least, and that care should be taken to prevent any of them from being lost or uselessly killed." Twenty-seven days after writing this letter, Commissioner Parker duplicates the contract of June 17 for beef at the same exorbitant price that he felt justified in paying before the appropriation bill passed; and he actually allowed this favored contractor to deliver some of the cattle as late as the 14th of November, a month after the cattle bought at $3 88, for delivery as needed, were due at all the reservations. The loss to the Government and the injury to the cause of Indian civilization by reason of the neglect to advertise for proposals will hereafter be shown. But before passing from this subject it may be well to refer to other violations of the law. In the case of a public exigency requiring immediate delivery of the article, the law says it "may be procured by open purchase or contract," while in this case lower bids were rejected, and assurances given that no purchases would be made until after the appropriation bill had become a law, when, at the same time, the Commissioner of Indian Affairs was privately negotiating with J. W. Bosler, as is shown by a certificate of the clerk of the returns office, certified to by the Secretary of the Interior, and hereto appended. The following law throws additional light upon those transactions with J. W. Bosler, for it appears, from another certificate, certified to by the Secretary of the Interior, and hereto appended, that the contract of June 17 with J. W. Bosler was not filed in the returns office until the 15th of July, and that the contract of August 10, for beef and flour, has not yet been filed in that office.

Payments to J. W. Bosler under contract of June 17	$395,248 37
Payments to J. W. Bosler under contract of August 10	361,464 19
Total	756,712 56

"JUNE 2, 1862. CHAP. 93.—AN ACT to prevent and punish fraud on the part of officers intrusted with making of contracts for the Government.

"*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled*, That it shall be the duty of the Secretary of War, of the Secretary of the Navy, and of the Secretary of the Interior, immediately after the passage of this act, to cause and require every contract made by them, severally, on behalf of the Government, or by their officers under them appointed to make such contracts, to be reduced to writing and signed by the contracting parties with their names at the end thereof, a copy of which shall be filed by the officer making and signing the said contract in the returns office of the Department of the Interior (hereafter established for that purpose) as soon after the contract is made as possible and within 30 days, together with all bids, offers, or proposals for the same; all the said copies and papers in relation to each contract to be attached together by a ribbon and seal, numbered in regular order numerically, according to the number of papers comprising the whole return.

"SEC. 2. *And be it further enacted*, That it shall be the further duty of the said officer, before making his return, according to the first section of this act, to affix to the same his affidavit in the following form, sworn to before some magistrate having authority to administer oaths: "I do solemnly swear (or affirm) that the copy of contract hereto annexed is an exact copy of a contract made by me personally with ———; that I made the same fairly, without any benefit or advantage to myself, or allowing any such benefit or advantage corruptly to the said ———, or any other person; and that the papers accompanying include all those relating to the said contract, as required by the statute in such case made and provided." And any officer convicted of falsely and corruptly swearing to such affidavit shall be subject to all the pains and penalties now by law inflicted for willful and corrupt perjury.

"SEC. 3. *And be it further enacted*, That any officer making contracts as aforesaid, and failing or neglecting to make returns of the same, according to the provisions of this act, unless from unavoidable accident, and not within his control, shall be deemed, in every case of such failure or neglect, to be guilty of a misdemeanor, and, on conviction thereof, shall be punished by a fine of not less than one hundred dollars nor more than five hundred dollars, and be imprisoned for not more than 6 months, at the discretion of the court trying the same. (U. S. Statutes at Large, 12, 1859-'63.)

It further appears from the following testimony that a written offer of June the 9th 1870, from a thoroughly responsible contractor, who was at that time supplying the

Winnebago agency with beef, was on file in the Indian Office. This offer, dated two days before the proposal of Bosler, and upon which his contract was based, was never sent to the returns office, although it is ordered that "all bids, offers, or proposals" should be sent there:

"WASHINGTON, D. C., *February* 8, 1871.

"THOMAS E. MCGRAW sworn and examined.

"By Mr. CHIPMAN:

"Question. How and where are you employed?—Answer. I reside in Washington City; I am a first-class clerk in the Indian Bureau.

"Q Do you remember the original letter signed by John Finn, dated June 9, 1870, offering to furnish beef to the Indian Bureau?—A. Yes, sir.

"Q. Examine the letter now shown you, and see if it is the original letter.—A. Yes, sir; that is the letter.

"Q. Was it signed by John Finn in your presence?—A. It was written by me at his dictation, and signed by him in my presence.

"Q. The letter now shown you is the original letter, and was taken from the files of the Indian Department?—A. Yes, sir; and was written in the Department."

The letter was read, as follows:

"WASHINGTON CITY, D. C., *June* 9, 1870.

"SIR: I have the honor to state that I have a large number of American and Indian cattle, left over from my late contract at the Winnebago Indian agency, which I propose to sell to the Indian Department for the use of the Sioux Indians at the Whetstone agency, at the following prices, viz: American cattle, from 4 to 7 years old, at 6¼ cents per pound, gross weight; Texas or Indian cattle, at 4¼ cents per pound, gross weight; said cattle to be delivered at Whetstone agency or reservation, as may be required, until the next contract is awarded.

"I am, sir, very respectfully, your obedient servant,

"JOHN FINN.

"Hon. E. S. PARKER,
"*Commissioner of Indian Affairs.*"

It further appears that the contract for transportation, amounting to $179,247 55, entered into on the 26th day of September, 1870, was not sent to the returns office until the 16th day of December, 1870. The contract with J. W. Bosler for bacon, in September, 1870, was sent to the returns office on the 3d day of February, 1871.

Second. The following letter from the member of the Committee on Appropriations of the House of Representatives who was charged with the care of the Indian appropriation bill, shows the design of Congress in introducing section 3 into that bill:

"COMMITTEE ON APPROPRIATIONS,
"HOUSE OF REPRESENTATIVES,
"*July* 20, 1870.

"DEAR SIR: In answer to your note asking my interpretation of the following provision of the new Indian appropriation bill, viz: 'It shall be the duty of said commissioners to supervise all expenditures of money appropriated for the benefit of the Indians in the United States, and to inspect all goods purchased for said Indians, in connection with the Commissioner of Indian Affairs, whose duty it shall be to consult said commissioners in making purchases of said goods,' I reply that it seems to me its meaning is on the surface. Congress desires that your commission shall oversee and advise in all contracts for, or purchases of, Indian goods; shall see that the articles bought are suitable, and the prices reasonable; that the kind and amount of goods contracted for are delivered; that annuities are properly paid; that presents are justly and judiciously given; in short, that you shall 'supervise all expenditures of money appropriated for the Indians.' This is expressly made your duty by the statute, and your board must fulfill it or resign. It makes it the duty, also, of the Indian Commissioner to consult your board in all purchases for the Indians. You do not expend the money, for that is the duty of the Commissioner. But you have a right to know of, and advise in, all expenditures, all receipts for goods, &c. In case of a difference of opinion between yourself and the officer charged with the disbursement, you can only advise and report to the Secretary the facts which induce your dissent. I do not think, however, in view of the earnest desire of the Secretary and the Commissioner of Indian Affairs for an honest and efficient administration of Indian affairs, that your board will have any difficulty in complying with the requirements of the provision in question.

"Respectfully,

"A. A. SARGENT.

"VINCENT COLYER, Esq.,
"*Secretary Board of Indian Commission.*"

Mr. Brunot, the president of the board of Indian commissioners, in his testimony, gives the following answers to questions put by the counsel of Commissioner Parker:

"Question. Was the question ever discussed among you whether the term 'goods' embraced everything for which there was to be an expenditure?—Answer. Yes, sir; I believe it was.

"Q. But did you discuss the meaning of the word 'goods,' as used in the law?—A. Yes; I think it probable that we did at the first meeting of the board or at its organization.

"Q. What was your determination at that time?—A. We came to the conclusion that it was intended to cover all the expenditures of the Indian Department.

"Q. For whatever purpose?—A. Yes. It was not for me or for our board to stand over the Commissioner of Indian Affairs, watching his movements, and demanding of him to come to us for the purpose of consulting us.

"Q. The language used by the act of July 15, 1870, is, that it shall be the duty of the commission to supervise all expenditures, &c. Did you take that to mean consistently with the duties which you owed to your private positions, or did you receive that duty as a public officer would, to the exclusion of your other responsibilities?—A. Not to the exclusion of all our other responsibilities. We had made very great sacrifices of our private affairs in order to perform this duty.

"Q. You did not feel yourselves acting under the obligation of an official oath; you were not paid?—A. We were not paid.

"Q. Your services were voluntary?—A. Yes, sir.

"Q. You recognized no pecuniary liability to the Government for your conduct?—A. No, sir.

"Q. There were, therefore, none of the responsibilities connected with your office that are thrown around officers appointed by law?—A. Much higher responsibilities."

It was admitted by the Commissioner of Indian Affairs and testified to by the president and secretary of the board of Indian commissioners, that said board was not consulted in the purchase of provisions; that it was not called upon to inspect them, or to supervise the expenditures of money for transportation. The board was only called on for such duties as it had performed before the passage of the law of July 15; therefore no effect was given to that law by the Commissioner of Indian Affairs. The board, before the passage of the law, say June 3, had advised the Commissioner of Indian Affairs of its readiness to act; three days after the passage of the law Commissioner Parker notified President Brunot that he would meet the commissioners in New York on the 21st of July, for consultation as to the best method of proceeding expeditiously in making the necessary Indian purchases. At that interview the importance of the new powers intended to have been conferred on the board became manifest. Mr. Colyer, the secretary of the board, testified as follows:

"Q. Has the Indian commission in any way acted under that section of the law?—A. Yes, sir.

"Q. To what extent?—A. In the matter of the purchase of annuity goods in New York on the 21st, 22d, and 23d of July.

"Q. What class of goods were they?—A. What is known as annuity goods—dry-goods, clothing, hats, shoes, blankets, cloaks, &c.

"Q. And did your board inspect all of these goods purchased since the passage of the last appropriation bill?—A. We inspected the great bulk of what was advertised for, but there were other goods afterward purchased as presents, and sent out to the Indian country, which we did not inspect.

"Q. Were you called upon to inspect them?—A. Not that I know of.

"Q. Do you keep the records of the board?—A. Yes, sir.

"Q. Would there have been a record of it if inspection had been made?—A. I think there would be. I should have heard of it. The presents that were purchased were purchased some little time after the commission had made their great purchases in the latter part of August.

"Q. Do you know how the prices and quality of the goods inspected compared with those bought without inspection?—A. The contrast was very marked. The method of advertising, under our superintendence, was changed from the old method. By the old method the proposals were worded that the bidding should conform to a specimen in the possession of the Department. Our committee on purchases conceived that that was a disadvantage to many of the manufacturers; that it gave the manufacturer of that particular article, of which there was a sample in the Indian Department, an advantage over other manufacturers, because those that bid had to have goods conforming to that particular sample. The committee changed this, and made it so that every merchant or manufacturer should bring in his own samples and his prices, and the committee could thus judge between the goods presented for their examination, and between the prices, and they purchased those which they thought best and cheapest for the Indians. The committee not only changed the mode of advertising, but took special pains that the advertisements should be in the papers longer than usual, and should be generally circulated. They extended the time for the advertisements, and also took

pains to see that the advertisements were cut out of papers and copies sent to the most prominent manufacturers and merchants. The committee also addressed circulars to the leading merchants and manufacturers.

"Q. What effect had that on the purchases?—A. It had the effect of making more men send in proposals. A better class of bidders were induced to compete; such men as A. T. Stewart, H. B. Claflin, and others. They sent in specimens, and informed us that it had not been their custom heretofore to compete for the contracts, as they had no probability of getting them, but that, as they saw there was likely to be fair dealing now, they were willing to take the trouble to send us specimens and prices.

"Q. What was the effect as to the quality and prices of the goods?—A. We purchased our goods at first hands. We bought our blankets from the manufacturer, Mr. Dobson, of Philadelphia. We also bought from H. B. Claflin & Co., and from the manufacturers, at first prices.

"Q. What was the result as to quality and prices?—A. The advantage was that we got much better goods at much lower prices."

Had the design of the act of Congress of July 15 been fully carried out, so that the course pursued in the purchase of annuity goods had been applied to all expenditures of money under that act, there would have been a thorough reformation in the Indian Office. The following facts from the testimony in this case indicate the mode of conducting purchases when not under the observation of the board of commissioners:

Commissioner Parker says, when speaking of purchases made by him a few days after he had ceased to consult the commissioners, "I gave an order to Buckley, Welling & Co., a house in New York dealing largely in Indian goods, for the goods which I proposed to send out to the Osages." * * * * * *

"Presents given to Indians who have been convened in council are generally intended for the chiefs and head men, and are intended to be of little better quality than those ordinarily supplied."

A sample of the blankets so purchased was shown to experts in the presence of the committee, and although $8 a pair was paid, yet the experts pronounced those blankets to be inferior in dye and texture, and worth from $1 10 to $1 15 less than the blankets purchased by the commissioners at $7. It is in evidence that the blankets purchased by Commissioner Parker at $8 were the same that had been rejected by the commissioners a few days before at $6 80. It also seems that the commissioners broke up the old Indian rings and combinations by which the Government had been so long defrauded. Mr. Thomas J. Buckley, of Buckley, Welling & Co., testified as follows:

"Q. State whether you made any arrangements with the manufacturers of blankets to bid for them.—A. We proposed an arrangement. I believe Mr. Dobson accepted it.

"Q. At whose instance did he back out; did you hear?—A. I have not heard Mr. Dobson say so. I understood it was Mr. Stuart who requested him to put in a bid for himself."

The reference is to Mr. George H. Stuart, the chairman of the purchasing committee of the board of Indian commissioners.

Commissioner Parker, in his letter to the Secretary of the Interior, dated January 12, 1871, says: "Respecting the allegation that the board of Indian commissioners were not consulted in the purchases made of beef and flour, I have only to say that the act authorizing such consultation and inspection passed on the 15th of July, 1870, while the contract complained of was made June 17, 1870, nearly a month preceding the passage of the act."

On the 24th of January Commissioner Parker, being sworn, gave the following answers to queries put by his counsel:

"Q. Did the matter come up in your mind as to whether the term 'goods,' used in the appropriation act approved July 15, 1870, embraced the matter of supplies generally; and if so, what interpretation did you give to the statute?—A. I have never had but one impression until recently on this subject, which was that the term 'goods' generally used in the appropriation act did not embrace what we call subsistence or provisions.

"Q. Do not the laws distinguish between the two; and in this same appropriation act do not these two items appear separately?—A. They appear separately as a general thing, and I suppose there is where I got my impression.

"Q. Did you feel that it was your official duty to consult the board of commissioners in regard to this matter of provisions or subsistence, and did the question come up in your mind as to whether it was your duty to consult them?—A. I did not regard it as my duty to consult them.

"Q. Was that the reason you did not consult them?—A. That was the only reason."

Commissioner Parker made the following replies to queries by Mr. Sargent, the chairman of the committee of investigation:

"Q. Do I understand you to say you think the words 'Indian goods' do not include flour, bacon, tobacco, coffee, and sugar?—A. My impression is, that in a reading of the law goods are made a separate item.

"Q. Where the law of 1869 provided that they should exercise joint control over the

disbursements of appropriations made by that act, did not that, in your judgment, include expenditures for cattle, flour, tobacco, and coffee?—A. Very likely it did, but the execution of that law, absolutely with such a construction, would be utterly impossible, for they would have to come to the Indian Office and supervise every disbursement made under the Indian bill.

"Q. Would it be impracticable in respect to the disbursement of large sums?—A. No; but if you were to carry out that construction literally, it would be impracticable.

"Q. Could it not be carried out substantially where immense contracts were made, like these you have been speaking of this evening?—A. Yes, sir.

"Q. By the act of 1869 it is provided that $25,000, or as much as may be necessary, is appropriated for the transportation, subsistence, and clerk-hire of said commissioners while engaged in that service. Is your construction that that amount was provided for transportation and subsistence in buying a few dry goods in New York or elsewhere?—A. No, sir."

Commissioner Parker estimates that the dry goods supervised by the commissioners cost from $350,000 to $400,000, while it is in evidence that in the region of the Missouri River $1,138,511 09 were expended without the supervision of the commission, and contracts are pending for $280,000 yet to be paid.

It is in evidence that on August 6, 1870, Durfee & Peck were paid $53,494 37 for supplies to Indians at Fort Berthold, on the Missouri River, a point to which freight was carried at two cents a pound until the end of August, under the advertised contract.

As this voucher was not the subject of discussion before the committee, it may be that there was some exigency like that of June 17, where the contractor felt justified in charging extravagant prices owing to the uncertainty of being paid. It would have been a satisfaction to tax-payers if that voucher had been supervised by Messrs. Stuart, Campbell, Dodge and Farwell, the committee of the Indian commission that is charged with that duty. Three-point blankets, at $17 50 a pair, sugar at 30 cents a pound, bacon at 40 cents, corn meal at 22 cents, and flour at $20 a sack, *seem rather high!* Tax-payers are very patient people, and Congress has manifested much forbearance with the Indian Office, but the time of reformation is approaching. Congress requested the President to give the board of unpaid commissioners, of his own selection, joint control, with the Secretary of the Interior, over Indian appropriations. No such controlling power was given; and at its next session Congress directed the Commissioner of Indian Affairs to call upon the board of unpaid commissioners to supervise all expenditures. Their mandate was not heeded. Now, by the action of the House, if concurred in by the Senate, payment cannot be made until vouchers are examined and approved by the board of commissioners. Surely the tax-payers will not be satisfied by anything short of this.

Third. Exorbitant prices paid for provisions and the consequent waste of the public money. In ascertaining the market value of supplies for the Indian Department there is no authority for being guided by the testimony of dealers when there were existing contracts made in conformity with legal requirements. It is in evidence that the Commissary Department was paying $4 20 per 100 pounds for cattle, to be delivered weekly to all those Indian reservations, at the expense and risk of the contractor. It is also in evidence that two cents per pound is a fair difference between contracts for the delivery of the whole herd immediately on its arrival, and compelling the contractor to keep the cattle at his own expense and risk, delivering them from time to time as needed. The bids for cattle opened September 12, give a market value somewhat unfair for the Government. Instead of being advertised for thirty days to elicit bids from first hands, intermediate dealers alone could make offers, as the advertisement was to be inserted for only nine days in Washington, and three to five days in the western cities. The time was, however, extended for a week by order of the Secretary of the Interior. There were seventeen bids for 7,140,000 pounds of cattle to be delivered monthly for nine months—the first delivery to be made from the 1st to the 15th of October. One bid was at 3¾ cents per pound, one at $3 88, and one at $3 90; one at $3 90 to $4 13; one at $3 93 to $4 37; one at $4 20, &c. As the bid at 3¾ cents was by a good man with good security, it affords legal testimony of the market value of cattle to be delivered on the reservations up the Missouri, monthly, as required. There is a striking correspondence between this price and two other existing contracts with the Indian Department, say Dr. Burleigh's for deliveries weekly at the Santee Sioux reservation at $7 22 net, or $3 61 on the hoof, and John Finn's contract for the delivery of beef to the Winnebago Indians, near the Missouri River, at $6 90, net, or $3 45 on the hoof. An allowance of one cent a pound for the care and risk of keeping cattle, being only half the rate testified to, brings the bid of 3¾ down to 2¾, the precise rate that Captain Poole saw in the contract for cattle delivered at the Whetstone reservation. There is a somewhat striking contrast between this price and 6½ cents for immediate delivery, as per contracts of Commissioner Parker, dated June 17 and August 10, the deliveries on which were made from the end of July to the 14th of November.

The existing contract for flour delivered on the Santee reservation was at $3 35 per sack delivered monthly. Three dollars and thirty cents was paid for delivery at the

Ponca reservation, and $2 15 per sack for delivery at Council Bluffs, on the Missouri River. The contract of Commissioner Parker with J. W. Bosler, of June 17th, was at $6 50 per sack. For salt 8 cents per pound, when an existing contract with Finn was at 2 cents per pound. For sugar made from molasses, 18 cents per pound; coffee, 28 cents; tobacco, 85 cents; bacon, 25 cents, and soap 15 cents.

The profit to the contractor may be fairly estimated as follows:

7,911,837 pounds of beef delivered, profit estimated at 3¾ cents per pound....	$296,693
$141,557 under July contract for flour, salt, &c., 40 per cent. profit.....	56,622
$100,950 for flour under contract of August 10, 33⅓ per cent. profit.....	33,650
Estimated profit on freight, as hereinafter stated	114,104
Estimated profit of J. W. Bosler and his associates, if he had any.....	501,069

It will be hardly necessary to estimate the profit made by Green & Wattles by furnishing groceries to the extent of $81,481 in New York, August 26; say, sugar made from molasses at 11½ cents, coffee 21½ cents, tobacco 65 cents. Private purchases were also made from others to the extent of $25,000 and more.

As Commissioner Parker attempted to justify the extravagant prices indicated in the contract of June 17 by reason of a possible delay in making payment, the following extract from the contracts of Burleigh & Finn, already referred to, is significant: "All articles of subsistence furnished must be of good quality, and subject to inspection and rejection by the agent of the ———. The right is reserved to increase or diminish the amount of supplies, at the discretion of the superintendent of Indian affairs for ———, also to terminate the contract that may be entered into on giving the contractor six weeks' notice. Payment shall be made by the superintendent of Indian affairs at ———, when funds are placed in his hands for that purpose; but in the event of the superintendent of Indian affairs being without funds, then payment to be made as soon after as funds may be received for that purpose." Commissioner Parker testified as follows:

"Q. Who was the commissary contractor?—A. His name, I have learned, is Fenlon.

"Q. What price was the War Department paying that commissary contractor at that time?—A. Four cents and forty-four one-hundredths.

"Q. To be delivered at the agencies?—A. Yes, sir.

"Q. Why did you pay 6½ cents when these commissary contractors were furnishing it at these agencies at 4.44?—A. No such offer was made to me. I got the impression from my daily intercourse with these people, that they did not want to supply any more at that rate; that they had lost money under their arrangement with the Commissary Department, and I had the impression that they would not do it.

"WASHINGTON, *January* 27, 1871.

"Major B. DUBARRY sworn and examined.

"To Mr. WELSH:

"I am a commissary of subsistence of the United States Army; I am on duty in the office of the Commissary General of Subsistence, as one of the assistants to the Commissary General of Subsistence.

"Question. State the price and number of cattle contracted for, to be delivered on the Missouri River, in the contract made June 18, 1869, which was to terminate on June 18, 1870.—Answer. I have here a copy of the contract made on the 18th of June, 1869. It was made with Edward Fenlon, at the rate of $4 44¾ per hundred pounds live weight.

"Q. Were the cattle to be kept at the contractor's risk and expense until needed, or were they to be delivered in bulk?—A. Their delivery was to commence on the 31st of July, 1869, and to continue until the number provided for by the contract was delivered, at specified rates per month, the rate being different for the different points at which they were to be delivered. The contract runs that the 'beef cattle provided for at the respective places named are required to be held by the contractor sufficiently near thereto that he may with certainty and at the rate and under the conditions above specified, deliver them weekly, semi-monthly, or monthly, as the officer or agent of subsistence of the Department may require.' The whole number comprised in this contract of the 18th of June was 9,075.

"Q. After the completion of that contract was any other contract made?—A. On the 6th of July, 1869, a supplementary contract was made with Edward Fenlon. The supplementary contract was for the same rate as the other and for the same number of cattle; it only made a change in the points of delivery from the first contract.

"Q. Then it is only a repetition of the first contract, changing the place of delivery?—A. Not exactly a repetition, because it does not repeat all that is in the first contract, but it refers to the first contract. Subsequently, a proposition was made by the con-

tractor, Edward Fenlon, to furnish any additional number of cattle that might be required at the five points named in the supplementary contract, (three points only being named in the original one,) at $4 20 per hundred pounds, gross weight, during the continuance of said contract—that is, up to June 30, 1870. That proposition was accepted by General Clark. The date of it was 21st of September, 1869. That was to extend up to 30th June, 1870, and was to embrace all the cattle delivered over and above the total of 9,075, provided for by the first contract.

"Q. Is there any limit as to the amount of cattle you could call for under the proposition of 21st September, 1869?—A. I find no limit assigned in it. The contractor agrees to furnish all the cattle required at $4 20 per hundred pounds."

(The papers referred to by the witness are annexed to the testimony.)

"Q. If the Commissioner of Indian Affairs had called on you for cattle before the 30th of June, 1870, could you have furnished him with cattle under that contract?—A. Yes, at those points. All what the contractor furnished in excess of 9,075 was to be furnished at $4 20 per hundred pounds, gross.

"Q. Did the Commissioner of Indian Affairs send to your office to ascertain what supplies would remain over on the 30th June, 1870, or what supplies it would be possible for you to give him?—A. I do not recollect of it.

"Q. Have you charge of the office here?—A. I have not charge of the office; but as assistant to the Commissary General I see pretty much everything that comes in. My province at that time was to see everything that came into the office. The papers pass through my hands, and I open and hand them to the chief, or distribute them, according to their nature."

General Cox, the then Secretary of the Interior, seemed to have been impressed with the belief that some legal arrangement had been made with the commissary contractor for temporary supplies, if they should be needed, and in his testimony he distinctly disavows having given authority to make the Bosler contract or any other contract without the warrant of law. Any one familiar with the routine of the Interior Department knows full well that *pro forma* letters, like that from Secretary Cox requesting military escorts, are signed on the representation of clerks without perusal. That letter, and the others relating thereto, were, as you know, placed in evidence after the testimony had closed. Instead of its being available to contradict the testimony of Secretary Cox, it shows a special consideration for this favored contractor, who alone, so far as it appears from the testimony, was allowed a military escort. Little consideration need be given to J. W. Bosler's apprehension of loss by the contract of $3 88, in which he is half interested, as he testified that he did not know the cost of the cattle being delivered under that contract.

Fourth, (No. 9 in statement.) On the 11th day of July, 1870, L. H. Roberts, M. D., acting Indian agent for the Cheyenne agency, receipted to J. W. Bosler for flour, bacon, sugar, coffee, tobacco, salt, and soap, giving the weights indicated in the bill of said Bosler. On the 29th of July he also receipted for 270,000 pounds, net, of good merchantable beef for Cheyenne Indian agency, equal to 540,000 pounds on the hoof. He testified that there were 450 oxen which he averaged at 1,200 pounds each, as is alleged, at the instance of an officer who rode through the herd. Roberts said, "I told him I was not competent to judge." Roberts was asked, "Did you ever send the certificate of Captain Irvine or any other officer on that subject?—A. No, sir.

"Q. Have you any such certificate in your possession?—A. No, sir.

"Q. You say you were not accustomed to estimating the weight of cattle; do you recollect the form of the receipt which you gave for these cattle?—A. I do not. I committed an error in not retaining a copy of the receipt.

"Q. Did you know the weight of these cattle at any other agency?—A. I did not."

The other testimony of Doctor Roberts is self-condemnatory, and no evidence of any kind was produced by him or by Commissioner Parker to verify these exceedingly loose vouchers. Doctor Roberts says that cattle were killed every Saturday. Therefore, if the large cattle-scales were out of order, as is alleged, he could have weighed quarters of beef on the scales that were used in weighing sugar, bacon, &c. Prairie fires are very unusual in July, and as nutritious grass superabounds in that region, it is hardly likely that the herders would stint cattle. On the 20th day of August, Captain George M. Randall, an Army officer of high standing, and the Indian agent at Cheyenne agency, notified Commissioner Parker that he had weighed a sufficient number of the cattle to ascertain that they averaged 934 pounds each, gross weight. The weight of the soap (as ascertained by weighing) corresponded with the bill, but the weight of all the other articles was short—say, tobacco 30 pounds, salt 120 pounds, coffee 1,155 pounds, bacon 1,770 pounds, sugar 1,405 pounds, and flour 3,120 pounds. This deficiency is ascertained by comparing the weights paid for with Captain Randall's certificate. He said in his letter of August 20th: "I shall take up the subsistence at the weights according to the inventory taken. No invoices were received from the contractor, and therefore I am unable to ascertain what amounts were received and receipted for. All the papers I have to show are the steamboat's bills of lading, which will not answer my purpose. If the memoradum receipts given by

Doctor Lorenzo H. Roberts have not been paid, I must respectfully request that they be withheld, and I be directed to furnish correct vouchers." An intelligent agent of high standing notifies the Commissioner of Indian Affairs that he will not allow his account to be charged with erroneous or fraudulent memorandum receipts given during his absence, as is known, on official duty. The Indian Department certifies this erroneous or fraudulent voucher for payment, and then does not notify the Second Auditor of the fraud or error, that it may be corrected before the next payment is made. The following question was asked Commissioner Parker:

"Was the Second Auditor ever notified of the receipt of a communication from Agent Randall of August 20, 1870?—A. Not by me."

The excess in the payment over the proper voucher given by the accredited agent, amounts to $2,473 20. It is more than probable that the same mode of obtaining vouchers was practiced elsewhere, possibly through error, as there were no invoices, and bills of lading give the gross weight, including packages. It further appears that the following excess of weight has been paid for beyond the quantity indicated in the contract:

Flour, 59,200 pounds; coffee, 3,700 pounds; tobacco, 1,843 pounds; sugar, 8,997 pounds; salt, 150 pounds; soap, 1,500 pounds; beef on the June 17th contract, 392,934 pounds; beef on the August 10th contract, 1,007,903 pounds.

It also appears that at the Whetstone agency, when the cattle were all weighed, one drove averaged 915 pounds, another 1,017 pounds. At Crow Creek one drove averaged 976 pounds, and at Cheyenne, when Captain Randall was present, 1,025 pounds. The average weight at other agencies cannot be ascertained, as, like Dr. Roberts's receipt, the number of cattle is not mentioned, therefore it is possible that some of the vouchers may resemble it in other particulars.

Fifth, (No. 12 in statement.) The law of March 2, 1861, chapter 84, section 10, disallows contracts for services in any of the departments of the Government, except for personal services, when the public exigencies do not require the immediate performance of the service, without previously advertising a sufficient time for proposals respecting the same. As this legal requirement was fulfilled by the Quartermaster General, and as he, by public advertisement and by specific contract, included all the Indian goods, all other testimony in regard to freight is irrelevant. Indian goods were sent up the river under these contracts prior to June 30, and the Indian Office ought to have availed of them thereafter, instead of making a private contract (September 26) in violation of one law, and keeping it back from the returns office until December 16, in violation of another law. It appears from the evidence that this private contract was arranged in New York in August last, between Charles D. Woolworth, secretary of the Northwest Transportation Company, and General Parker, the Commissioner of Indian Affairs. Woolworth testified that the company for which he was negotiating had contracted in the name of Hiram K. Hazlett, their clerk, with the Quartermaster General for the transportation of Indian goods from Chicago, via Sioux City, to all the points up the Missouri River. He also knew that George K. Hazlett had contracted with the Quartermaster General for the transportation of Indian goods from St. Louis, Sioux City, and intermediate points up the Missouri River, and that the Northwestern Transportation Company had become a party to the latter contract, by agreeing to carry the quartermaster's stores and Indian freight at fifteen per cent. less than the contract price. Charles D. Woolworth testified as follows:

"Q. Had you any talk with General Parker ever about carrying Indian goods under those contracts? A. No, sir.

"Q. When you made a bargain with him for specific work, did you notify him that there was already a contract for carrying Indian goods?—A. No, sir.

"Q. Are you not aware that Indian goods could have been shipped on either of those contracts?—A. Any Indian goods delivered to us at Chicago, I suppose, we should have been obliged to carry under that contract.

"Q. Then what is your understanding of these contracts as to time? When Indian goods are delivered to you on the 1st day of September at Chicago, you date it from their receipt at Chicago; and when delivered to you on the 1st day of September at Sioux City, you date it at Sioux City?—A. Yes, sir.

"Q. Then the date is from the time these goods are delivered to you as being ready for shipment?—A. Yes, sir. But they have got to give us ten days' notice. They cannot come to us with goods without notice.

"Q. But that ten days' notice could have been given ten days before the time of receiving the goods?—A. Yes, sir."

It thus appears that under existing contracts all Indian goods delivered to the transportation company in Chicago or Sioux City before the 31st day of August could have been carried at the minimum rates—say from Chicago at an average of $1 88, which sum, less 65 cents a hundred, the railroad freight from Chicago to Sioux City, gives an average of $1 23 from Sioux City to all the agencies from Yankton to Berthold. The average freight on the other contract from Sioux City to the several agencies is $1 33 per 100 pounds during August, and $2 60 during September. The freight

under the Chicago contract, from the 1st of September to the 31st of October, less the railroad charges, is equal to $3 11 from Sioux City to all the agencies. The private contract made by Commissioner Parker at New York, in August, averages, from Sioux City to all the reservations, $4 80½, but practically it equals nearly $5 20, as $179,247 55 were paid for the transportation of 3,281,498 pounds of freight. Of this sum $1,218 82 was paid on goods sent to Berthold in April, when the freight, under the contract of the quartermaster, that extended to Indian goods, was 2 cents a pound, while the Government paid 7½ cents a pound, by including it in the private contract of September 26. As it appeared by the books of the Second Auditor that the entire freight of $179,247 55 was paid to C. D. Woolworth, secretary, in care of J. W. Bosler, the drafts were examined in the United States Treasurer's office. They appear to have been indorsed by C. D. Woolworth, secretary, to the order of J. W. Bosler, and by him indorsed to the order of Jay Cooke & Co., New York. From the evidence of J. W. Bosler, it appears that he wrote the name of C. D. Woolworth, secretary, on the back of each of the notes, and it does not appear that he gave any intimation to the Treasury Department that he wrote Woolworth's name. He alleges, however, that he had a letter of authority, but he did not exhibit it, although C. D. Woolworth testified that he had given that authority. This strange transaction made it important that J. W. Bosler's account with Jay Cooke & Co., New York, should be investigated by the committee. It is in evidence, and from that account it appears, that the $179,247 55 were placed to the credit of J. W. Bosler, while the drafts in favor of the president and secretary of the Northwestern Transportation Company amount to $65,143 75, or 2 cents a pound on the freight shipped up the Missouri River, being about the average freight under the advertised contract—say to the 30th of September from Sioux City and the 31st of October from Chicago. Commissioner Parker, in his letter of January 12, to the Secretary of the Interior, which is in evidence, says:

"Respecting the transportation, to which reference is also made as being high, and, therefore, conclusive of fraud, I reply that nearly all the Indian freight, consisting of annuity goods and some other supplies, reach Sioux City in October, at a time when navigation on the Upper Missouri had nearly ceased on account of low water and the near approach of cold weather, and I made the very best terms I could with the most responsible parties running boats on the upper river to insure the certain delivery of the Indian freight. The prices paid, in my judgment, were reasonable, and will compare favorably with what has been paid in former years, and that paid by the Army for the fall months of the present year. It must be borne in mind that the season was late; all Indian freight was bound to be taken up to their respective destinations, or endless trouble would be the result of failure, and water transportation was cheaper than by land, though both were high."

It appears, however that most of the annuity goods and groceries, and a large quantity of flour, had actually been shipped before September 26, the date of the contract, and that J. W. Bosler was bound to deliver the bacon on or before the 20th of September. It should have been delivered at Sioux City in time to ship it at the average freight of $2 60 per hundred pounds. Flour ordered August 10, should have been delivered daring that month at Chicago, Sioux City, Council Bluffs, Omaha, and other points down to St. Louis, as the freight under the contract from Sioux City advanced more than 1¼ cents per pound in the next month.

Sixth, (Nos. 7 and 10 in statement.) It seems necessary, in conclusion, not only to consider the subjects embraced in Nos. 7 and 10, of the statement of misconduct in the Indian Office, but also to refer briefly to facts of a like nature that are in evidence.

"WASHINGTON, D. C., *February* 3, 1871.

"JOHN FINN sworn and examined.

"By Mr. SARGENT:

"Question. State your residence and occupation?—Answer. I reside in St. Louis; I am at present engaged in pork-packing; I am also a cattle-broker.

"Q. Do you know General Parker, Commissioner of Indian Affairs?—A. I do.

"Q. Did you in June last have any conversation with General Parker in his office, with reference to putting in a bid to furnish cattle for Indian purposes?—A. I did.

"Q. About what time was that conversation?—A. It was frequent in May, June, and July.

"Q. You spoke to him frequently about it in May, June, and July?—A. Yes, sir; I do not know the dates.

"Q. Did you make any proposition to him to furnish beef for these purposes?—A. I did.

"Q. Did you have any conversations on that subject about the time of the letting of the Bosler contract in June?—A. I did.

"Q. How near to the time of the letting of that contract?—A. The same day; I think the day before and the very day.

"Q. What did you propose to furnish him with beef for?—A. I offered him Texas

cattle at 4½ cents a pound, and American cattle at 6 or 6½ cents a pound, gross; I cannot say which.

"Q. Did you make any further offer to him in that connection?—A. I did; I told him I had cattle at the Winnebago agency, and that if he did not consider them worth 4¼ cents a pound, I would take less for them; that I wanted to sell them.

"Q. Had you a contract at that time to furnish cattle to any of the agencies; and if so, for how much and to what tribes?—A. I supplied the Winnebago agency for 7 cents, net, or 3½, gross.

"Q. Did you have cattle enough on hand to take a large contract on the Missouri River?—A. No; I could not fill a large contract with the cattle I had on hand, but I could fill any contract; I could get the cattle.

"Q. What reply did Commissioner Parker make to this proposition to furnish cattle at those rates?—A. He told me he had not any money appropriated by the Government to buy cattle; that if I would give him all the cattle I ever owned at half these rates, he could not take them, because he had no money appropriated for the purpose; that he could not let a contract.

"Q. Was anything said about the condition of the Indians or the necessity of furnishing beef to them?—A. Yes; I told him I had heard from the agent at Whetstone and from other reservations that the Indians were in great need of stock, and asked him if he was not going to buy them. He told me he would not do it. I asked him what he was going to do in regard to supplying these Indians. He said the Indians would protect themselves the same as they did previously; that they could take to the plains and subsist the best they could.

"Q. Did he refuse to accept your proposition?—A. He did.

"Q. On what day was this particular conversation that you allude to with reference to the time of making the Bosler contract?—A. I could not swear to that; I think it was the 16th or 17th of June.

"Q. With reference to the time of making the Bosler contract, was it on the day you heard the contract was made, or the day before?—A. It was the same day. I cannot swear positively to that. I know from other parties that he made a contract that day. I never saw the contract; I understood that it had been made.

"Q. How long after the contract was made did you hear of it?—A. I heard within two or three hours, that same afternoon.

"Q. Did you have the facilities for executing such a contract, the herders, &c.?—A. I did.

"Q. State to what extent you had such facilities at that time.—A. I refer to General Sherman, General Allen, chief quartermaster, and General Meyers for that.

"Q. State what facilities you had in the way of herders, buildings, &c., for filling such a contract.—A. I had the means and the money. I could fill any contract the Government could give me at that time.

"Q. Did you have men in your employ to do that business, at that time?—A. I had; I had horses and cattle at the agency, and I was able at that time to fill any contract the Government would give.

"Q. Was your contract for the Winnebagoes for a part of the year, or the whole year?—A. For the whole year, twelve months.

"By Mr. CHIPMAN:

"Q. State whether you feel unfriendly, or not, toward General Parker.—A. No, sir.

"Q. Have you never expressed any unfriendly feelings toward him?—A. I did on one occasion, last year. I thought he might as well have let me have the contract at 4½ cents, as Bosler at 6½. I thought I could fill a contract as well as Bosler. That is the only time I expressed anything in that way toward General Parker, to my knowledge.

"WASHINGTON, D. C., *February* 6, 1871.

"JOHN T. BALDWIN sworn and examined.

"By Mr. SARGENT:

"Question. State your residence and occupation.—Answer. I reside in Council Bluffs, Iowa. I am a kind of general trader in real estate, a miller, and other things.

"Q. Do you deal in any kind of merchandise?—A. No, sir.

"Q. Were you ever present at any conversation between Mr. Finn and the Commissioner of Indian Affairs, at the office of the latter, in Washington City; and if so, when was it?—A. I was present with Mr. Finn, I think, about the middle of June, 1870.

"Q. State what passed in that conversation between Mr. Finn and Mr. Parker in relation to a contract.—A. I think Mr. Finn asked Mr. Parker if he should continue to

furnish supplies to Indians after the 1st of July. Mr. Parker replied that he did not want him to continue. Mr. Finn asked him what he was going to do with the Indians, and how he would get provisions and supplies. Mr. Parker remarked that he could not make any arrangement for supplies until there was an appropriation by Congress; that the Indians would have to hunt, or to do as they had been doing before they were getting any supplies from the Government.

"Q. Was anything said by Mr. Finn with reference to a desire on his part to have another contract?—A. I do not recollect anything.

"Q. What was your object in going there?—A. I went in company with Mr. Finn to see if Mr. Parker did not want some flour for the Indians.

"Q. Did you make any proposition to Mr. Parker with reference to it?—A. I simply told Mr. Parker that I had been engaged in furnishing contractors with flour for quite a number of years, and that I would like to make a direct sale to him or to the Government in place of selling to the contractors.

"Q. What was his reply to that?—A. He remarked that he was not prepared to make any contract at that time with me for flour, but that as soon as the appropriation bill passed he would advertise in the Chicago and Omaha papers, and would send me a copy of the advertisement. I asked him where the letting would take place. He said he did not know, but that it would take place here or at Sioux City.

"Q. How soon thereafter did you hear of the Bosler contract being let for beef and flour?—A. I learned it through Mr. Finn some two or three days afterward. That was the first intimation that I had of it. I then saw Mr. Bosler about ten days afterward.

"Q. Did Mr. Bosler tell you that he had a contract?—A. Yes, sir.

"Q. Was that before the passage of the appropriation bill, which passed on 15th July?—A. It was before that. It was in the latter part of June that I saw Mr. Bosler.

"Q. Did you receive any copy of an advertisement from Mr. Parker after the appropriation bill passed?—A. No, sir; I did not.

"By Mr. WELSH:

"Q. Did you name any price for the flour to Mr. Parker?—A. No, sir.

"Q. At what rate were you prepared to furnish it then?—A. I would have been willing to have contracted for flour at about $2 50 a sack on the cars at Council Bluffs.

"Q. Or at the same price on the steamboat?—A. Yes.

"Q. What was the average price of flour at Council Bluffs in July, August, and September, 1870?—A. It ranged at about $2 25—from $2 25 to $2 50 per sack of ninety-eight pounds.

"Q. Is that a double or a single sack?—A. A single sack.

"Q. Do you know Mr. Hoffmeyer, of Council Bluffs?—A. Yes.

"Q. Do you know anything of a contract that he had with the Government to furnish flour, at $2 15?—A. No, sir; I am a partner of Mr. Hoffmeyer; I was aware of a sale of flour made at the mill; the sale ranged at from $2 to $2 75, according to the quality of the flour; he sold some 1,250 sacks to Mr. Bosler; most of it was sold at $2 75; that was in October.

"Q. Do you recollect a sale of flour at $2 15 a sack, bought on October 27 and paid for on November 29?—A. I recollect that."

The negotiation with Bosler referred to by Finn and Baldwin must have been going on at the time of their conversations with Commissioner Parker, as appears by a letter from J. W. Bosler, dated Carlisle, Pennsylvania, June 11, a certified copy of which is hereto appended. That letter should not have been separated from the contract of June 17, as it is appended to it in the returns office, and in fact forms part of the contract, being a description of the quality of the beef. The prices of every article correspond precisely with the contract, the beef being described as American cattle, at 6½ cents per pound, gross. The contract says "the beef is to be of good, merchantable quality, and to be delivered on foot; one-third, or thereabouts, to be delivered on or about the 15th of July; one-third on or about August 1, and the residue on or about the 1st of September, 1870."

It is somewhat significant that J. W. Bosler should have been released from his offer to furnish American cattle and allowed to substitute Texas cattle without any abatement in the price, although it is in evidence that there is a difference of two cents per pound in the market value in favor of American cattle. This contract was, in violation of law, kept in the Indian Office until July 15, when the appropriation bill became a law. It is deceptive in its appearance, as the beef is stated at so many pounds, net, while it is to be paid for per pound, gross, therefore the contract is for double the weight indicated. On the next day, June 18, the following instructions were sent from the office of Indian Affairs:

"You will receive from Mr. Bosler the supplies to be furnished under said arrangement; and should the quantity vary from the amount herein given in each or any case, either more or less, you will receipt to him accordingly; that is, you will give proper receipts for the amount of each article delivered, at the time of the delivery.

You will, also, make the necessary preparation to properly care for the supplies after they have been delivered.

"Very respectfully, your obedient servant,

"W. F. CADY,
"*Acting Commissioner.*

"Major J. M. GOODHUE,
"*Indian Agent, Yankton Agency, Dakota Territory.*
"Captain WILLIAM H. FRENCH,
"*Indian Agent, Crow Creek Agency, Dakota Territory.*
"Major G. M. RANDALL,
"*Indian Agent, Cheyenne Agency, Dakota Territory.*"

From these instructions, and in one case from subsequent instructions of a like tenor, the agents were constrained to receive 75,420 pounds of flour, sugar, coffee, soap, tobacco, and salt, beyond the weight indicated in the contract; also, 392,394 pounds of beef beyond the contract of June 17, and more than 1,000,000 pounds in excess of the contract of August 10. The agents were also compelled to relieve the contractor from his obligation to keep one-third of the cattle until August and one-third till September at his own expense. They were thus obliged to hire herders at the expense of the Government, and to assume the risk of stampeding and other casualties. Commissioner Parker testified on the 24th of January, as follows:

"Q. Did you send invoices or descriptions of the various kinds of goods, sugars, coffee, and other stores sent up to the various agencies, so as to enable them to examine as to weight, quality, &c.?—A. I did not send them personally. I gave instructions that it should be done.

"Q. Do you know that they were sent?—A. Not of my own knowledge.

"Q. Can you produce evidence that they were ever sent?—A. I presume I could bring from the office witnesses who would testify that they were put into the mails. It is a rule always to send copies of invoices to the consignee, and I am perfectly satisfied that they were sent; but as I did not do it myself, I cannot give it as a positive statement. I had returns from the agents sometimes stating that something was missing, showing that they had the invoices."

On the 3d of February the following communication was made to the committee:

"No invoices were sent from the office to agents of the supplies furnished under the June 17th contract by Mr. Bosler. The agents receipted to Mr. Bosler for what they received.

"Very respectfully, your obedient servant,

"E. S. PARKER, *Commissioner.*

"Hon. A. A. SARGENT, *House of Representatives.*"

As there was no description of the quality of the goods, or any account of the net weight, the agents were left at the mercy of the contractor, although the Commissioner of Indian Affairs says, "It is a rule always to send copies of invoices to the consignee." The contract of August 10th is as follows:

"DEPARTMENT OF THE INTERIOR,
"OFFICE INDIAN AFFAIRS,
"*August* 10, 1870.

"SIR: It being exceedingly doubtful whether, under any advertisement for supplying the Sioux of Dakota with beef and flour, they can be furnished in proper season to prevent a deficiency, I have to request that you will at once supply 1,500,000 pounds, net, more of beef, to be distributed at the various agencies on the Missouri River, in such amounts as shall be hereafter designated to you. Said beef will be paid for at the same rates per pound as is provided in your contract with the Indian Bureau, dated June 17, 1870. This beef must all be on the hoof, and of as good quality as was furnished under your contract, and must all be delivered at the several agencies on the Missouri River on or before the 15th day of October, 1870.

"You will also be pleased to collect for the Indian Bureau, for the use of the Sioux Indians of Dakota, from 2,000,000 to 3,000,000 pounds of good extra wheat flour, to be delivered in Sioux City, at as low rates as possible, which rates should not exceed 3½ cents per pound when delivered in Sioux City, ready for shipment by boat.

"Your accounts for beef will be settled in Washington, D. C., upon your presenting the receipts of the amounts received by the respective agents, who have this day been instructed to receive from you and receipt to you for the beef you may furnish under this order.

"The flour will be settled for in Washington, D. C., upon your presenting bills of lading from such transportation companies as may transport the same to the several agencies.

"Very respectfully, your obedient servant,

"E. S. PARKER, *Commissioner.*

"J. W. BOSLER, Esq., *Sioux City, Iowa.*"

The same plan of deceiving the eye by inserting half the number of pounds paid for was pursued as in the former contract; 703 of these oxen were forced upon Captain Poole at the Whetstone agency, although Commissioner Parker knew that he had a six months' supply, as appears by his letter of July 13, to Superintendent Burbank. Commissioner Parker allowed J. W. Bosler not only to deliver more than a million of pounds of cattle in excess of this contract, but also to delay the time of delivery beyond the period at which the cattle purchased at $3 88 cents were due. The order for the purchase of flour seems to have been without limit as to price or time of delivery, and it is not claimed that there was any exigency requiring immediate delivery. With the range of markets indicated in the two contracts for the transportation of Indian goods, this quantity of flour could have been had at short notice. John T. Baldwin testified that he would have furnished it at $2 50 a sack, and if bids had been solicited by advertisement in accordance with Commissioner Parker's promise to Mr. Baldwin, what is called Indian flour could have undoubtedly been procured at $2. This grade of flour is made not from wheat, but by grinding the boltings from superfine flour.

The charge of 6¼ cents a pound freight on flour to Grand River and 7½ to Berthold, instead of $1\frac{60}{100}$ and 2 cents, was the contract price, is rather hard on the Government and on the cause of Indian civilization.

Although the Bosler contract was sent on the following day to the agents, requiring them to receive all that was brought to their reservations, yet it appears that the Morrow contract of September 17 was not sent until December 2. This is significant, as J. W. Bosler had acquired half interest in the contract, and Captain Poole testified that the drovers expected to deliver all the nine months' supply at once to the agents, and that no provision for wintering cattle had been made by the contractor. I could have testified still more strongly to that fact from personal observation, as my presence alone checked the consummation of an immediate delivery. A brief reference to the history of this contract throws some additional light on this plan.

On the 27th day of August, 1870, Commissioner Parker advertised in the Washington papers for bids to furnish seven million one hundred and forty thousand pounds, gross weight, of beef cattle on the hoof, and a large quantity of bacon. The cattle to be delivered at the various Indian agencies on the Missouri River, one-ninth to be delivered from the 1st to the 15th of October, and one-ninth monthly thereafter, in such quantity as the respective agents shall require. The time of bidding was to cease on the 5th of September, at noon, and the contract then to be awarded. This would have allowed but a few days for advertisements in the western cities, and too short a time for bids, with proper security, to have been received from any distant point. It appears that J. W. Bosler bid 6½ cents for beef and 18¼ cents for bacon, but it does not appear in what manner the contract was to be allotted to the various bidders, whether by averaging the bids for beef and bacon, as has been quite customary, or by considering the beef and bacon as separate transactions. The former course seems the more likely, for although the bacon is deliverable at Chicago, and the beef at the Indian reservations, yet the bacon is also allotted to five agencies. From evidence, it appears that the Secretary of the Interior interfered, by directing the proposals under the advertisement to be extended seven days, say to September 12. By this extension of time, seventeen bids for beef were made, and it is in evidence, that after the extension, J. W. Bosler united with J. A. Morrow, of Omaha, in his bid of $3\frac{90}{100}$ per pound. It also appears in evidence, that J. McCormick, of Omaha, is a partner with J. A. Morrow, in the contract.

General William Meyers testified that John McCormick, of Omaha, sent to his office a bid by J E. Boyd, to be taken to the Indian Office on the last day that bids could be received. This bid was at 3.90 cents per pound, the same rate as the bid by Morrow, in which Bosler and McCormick were partners. On the morning of the 12th of September, the day the bids were to be opened, a telegram was received, signed by J. W. Bosler and J. A. Morrow, reducing the bid of $3 90 per 100 pounds for beef to $3 88, and the bid for bacon one-fourth of a cent per pound. When the bids were opened the contract was awarded to Joseph F. Gibbs, of St. Louis, his offer being 3¾ cents per pound. It is in evidence that his first-named surety is a responsible man. Gibbs was informed that the contract had been awarded to him, and on the 14th of September telegraphed thus: "I am compelled to decline my bid for furnishing beef to Indians, being unable to furnish required bonds," The natural inference is that he had been bought off by the next bidder, as is quite customary. The Indian Office seems to have quietly released the principal and his bondsmen, and awarded the contract, at an advance of 13 cents a hundred, to J. A. Morrow, J. W. Bosler having half interest in it. The control of this contract was most important to Bosler, for if it had been in the hands of others he would have been unable to force on the Government over one million pounds of beef in excess of his August contract at 6¼ cents per pound; and, if the beef under the Morrow contract had been delivered at the stipulated time, Bosler would also have been shut out from his late deliveries, which were made long after the time that had been agreed upon. If the scheme for immediate delivery that Captain Poole referred to in his testimony had not been thwarted, and the cattle had been delivered promptly,

there would have been a profit on the Morrow contract of eighty thousand dollars, if all the cattle cost the same as those delivered at Whetstone.

As it is the province of the Committee of Investigation to draw its own inferences from the testimony, and to form its own conclusions, I leave the subject with you after this hasty review of the case. It should be borne in mind that more than two hundred pages of closely-printed testimony were placed in my hands yesterday, with directions to furnish a written summary to-day. Allow me to thank you for your uniform courtesy toward one trained wholly in mercantile pursuits, and quite ignorant of legal forms and usages. I had supposed that the investigation would have been conducted by the committee; but when Commissioner Parker employed counsel to procure testimony, and to train and to question the witnesses, it became apparent that I must, to a certain extent, conduct the investigation or also employ counsel. The former course, although in most respects less advantageous to the case, seemed more kind, therefore I adopted it.

If, on examining the evidence, you find, as I believe you will, the wrong done to the Government and to the Indian to be much greater than it appeared to be in my letter to the Secretary of the Interior, I know you will not attribute it in any wise to skill in conducting the case, but to the development of malpractices that have become chronic. The unusual freedom from personalities during the progress of this long investigation, affords one pleasant reflection, although there is still much that is painful in the performance of this, one of the sterner duties of life. From your intelligent and earnest consideration of the case I feel confident that the cause of Indian civilization will be promoted, therefore the sole object that I had in revealing the alleged wrongs to the Secretary of the Interior will be accomplished.

WM. WELSH, *of Philadelphia.*

LETTER OF MR. PARKER.

MR. CHAIRMAN: In asking you to consider the suggestions submitted by my friend and counsel in this investigation, General Chipman, it is proper, perhaps, that I should say a word myself. I will not attempt to go over the testimony, as that has been done by my friend, nor could I do so with any satisfactisn to myself, or in any way to aid your committee, for I have not been able to attend the investigation, during its progress, and am not familiar enough with the facts of record to assist you in your examination of it. I do not know, either, that I can now add anything to what I have said under oath, in reply to questions asked me by the committee, and which I suppose were intended to cover the whole ground of this investigation. When I entered upon the discharge of the duties of my office, I knew how sensitive the public were with regard to the administration of our Indian affairs. I knew, too, the solicitude with which Congress has always regarded that Bureau of our Government service, and firmly resolved that I would administer the office to the b st of my ability, and in such a manner that no taint of dishonor, at least, should ever attach to my conduct. To what extent my ability has proved equal to the duties devolved upon me, it is not becoming for me to speak. I know that I have spared no pains, no sacrifice of personal convenience and pleasure, to discharge my whole duty faithfully. I do not claim that I have made no mistakes, for that is more, I think, than can well be claimed by any public officer; but, Mr. Chairman, I do say, and I speak it in as solemn a manner as I am capable, and to this extent I have already sworn, that I have never profited pecuniarly, or indeed otherwise, by any transaction in my official capacity while I have been serving as Commissioner of Indian Affairs. I cannot know in advance how you will regard the various matters which have been made the subject of your investigation, as they effect my personal honor and official integrity; but whether they are sufficiently explained by the facts in the record or not, no view which you may take of them can change the knowledge within my own breast. that I have never sought to defraud the Government out of one penny, or have knowingly lent my aid to others with that view. There is not to be found anywhere in connection with this trial—if I may speak of it as a trial—a single transaction about which I had at the time, or until Mr. Welsh published his letter of December last, the slightest suspicion that my conduct would be inquired into. All of my official acts now before your committee were performed in the usual routine of my official duties. I gave them no further thought afterward than such as would naturally come up in the mind of a public officer in the casual review of his past administration. When I was, in January, suddenly called upon to explain transactions of my office, six months previous, I could only rely for explanation upon such records as happened to remain in my office, and upon such facts as I could from other sources, bring to the attention of the committee. As to the effect of these records and facts, you are to be the judges, and I leave them with you in the full belief that you will weigh them well before you condemn my action. If human tes-

timony is to be believed, and if my sworn statements, as well as the sworn statements of others with whom I was suspected of being in complicity, are to be credited, I think I may safely leave the question of my personal honor in your hands. As to the wisdom of any particular act of mine into which you have been examining, of course your judgment and mine may differ, and as to this I can only rest upon the circumstances surrounding me at the time, and the facts in the record, tending to show whether I acted wisely or not.

You must admit, Mr. Chairman, that the matter is one of great moment to me, and while I have no right to ask at your hands any report other than that which may be the result of your own convictions, I think I have the right to ask that at the time you make it to the House of Representatives, you will also state all the material facts upon which your conclusions should rest. I do not shrink from any responsibility which I have incurred, or its just consequences, and I only ask that that body which ultimately determines upon the result of this investigation, shall have that full knowledge of my conduct which will enable them to form a correct judgment in a matter of such great importance to me.

E. S. PARKER.

Hon. A. A. SARGENT,
Chairman, &c.

REMARKS OF MR. CHIPMAN.

Mr. CHAIRMAN: In presenting to your committee what I shall desire to say with respect to the charges against my friend General Parker, it may not, perhaps, be improper to give the origin of this inquiry, although it may not be of much consequence in an examination of the merits of the charges themselves. On the 7th day of December last, Mr. William Welsh, a citizen of Philadelphia, addressed a letter to the Secretary of the Interior, which he caused to be published in the newspapers of this city, at or before the time it had reached the Secretary's eye. This letter contained no specific allegations of guilt against the Commissioner of Indian Affairs, and yet its statements were of such a character as to attract public attention; and on December 12, following, the matter was brought to the attention of the House of Representatives by Mr. Sargent of California, and the following resolution passed:

House Resolution, December 12, 1870.

"*Resolved*, That the Committee on Appropriations be directed to inquire and report to this House what effect, if any, has been given to the following provision of the act 'making appropriations for the current and contingent expenses of the Indian Department, and for fulfilling treaty stipulations with various Indian tribes for the year ending June 30, 1871, and for other purposes,' namely: 'It shall be the duty of said board of Indian commissioners to supervise all expenditures of money appropriated for the benefit of Indians in the United States, and to inspect all goods purchased for said Indians in connection with the Commissioner of Indian Affairs, whose duty it shall be to consult said commission in making purchases of such goods.' Also, to what amount moneys have been expended on goods purchased in disregard thereof; also, whether the contracts for the purchase of flour or beef cattle for the Indian tribes on the Missouri River have been corruptly or improvidently made, or for greater quantities than required by the service; also, to investigate the charges of fraud and improvidence against the Indian service made in the report of William Welsh, esq., to the Secretary of the Interior; also, whether any portion of the sum of $90,000 appropriated in said act for the Quapaw Indians has been paid to other parties or diverted from its intended use; and that they have power to report at any time, and send for persons and papers."

At the time Mr. Welsh's letter appeared, and these proceedings in the House of Representatives occurred, General Parker was absent in the Indian Territory, upon business connected with his Bureau. He returned in the early part of January, and, on the 12th of that month, addressed a letter to the Secretary in reply to Mr. Welsh.

Meanwhile, however, a sub-committee of the Committe on Appropriations, consisting of Messrs. Sargeant, Lawrence, and Beck, had been appointed to inquire into the matters contained in the House resolution, and on January 9, Mr. Welsh, in reply to what he styles "an official note" from the sub-committee, submitted thirteen charges, which I think it my duty here to state in full. They are as follows:

"STATEMENT OF MISCONDUCT IN THE INDIAN OFFICE.

"First. Extensive purchases of cattle, flour, groceries, &c., by private contract, about June 17, August 10, 1870, and at other times, in direct violation of a law of the United

States, which requires such supplies to be advertised for in the public newspapers before purchases are made.

"Second. Large purchases made nearly a month before the passage of the appropriation bill, and therefore without warrant of law, and to an extent not warranted by any exigency—the payments to one individual alone amounting to more than three hundred and thirty-five thousand dollars. The letters of June 18, 1870, from the Indian Office to Agent Poole and others, show conclusively that there was no exigency requiring large purchases, as one-third of the cattle were to be delivered about July 15, one-third August 1, and one-third September 1, 1870.

"Third. A violation of the appropriation bill passed July 15, 1870; section 3 making it the express duty of the Commissioner of Indian Affairs to consult the board of commissioners in making purchases of all goods to be paid for under said appropriation bill; large purchases of beef, flour, &c., having been made without the knowledge of said board of commissioners.

"Fourth. Section 3 of said appropriation bill makes it the duty of the board of Indian commissioners 'to supervise all expenditures of money appropriated for the benefit of the Indians in the United States, and to inspect all goods purchased for said Indians, in connection with the Commissioner of Indian Affairs, whose duty it shall be to consult said commission, &c. This well-defined duty imposed on the Commissioner of Indian Affairs was only complied with in the supervision and inspection of dry goods, and wholly neglected in other and far more extensive and important expenditures of money.

"Fifth. Culpable neglect in not ascertaining by telegraph or otherwise how much beef and other supplies were likely to be furnished by contractors under the Commissary Department before making large purchases of beef, &c., as per contracts of June 17 and August 10, 1870.

"Sixth. Exorbitant prices paid for provisions about June 17 and August 10; six and one-half cents per pound being the contract price for Texas cattle on the hoof, to be received and receipted for by the agent immediately on the arrival of the herd. The Commissary Department was at that time supplying the agencies at 4.45 cents per pound, and a contract, when properly advertised, was subsequently made by the Indian Department at 3.88 cents per pound. In both cases the contractor was bound to keep the cattle at his own expense and risk, deliverable as required by the agent from time to time during the period of nine months. The contractor for the cattle at 6½ cents is also a partner in the contract at 3.88 cents. He and others in the cattle business admit that the cost and risk of keeping Texas oxen in that stormy region and near hostile Indians for delivery as needed, exceeds 1¼ cents per pound, which, deducted from the 4.45 and 3.88, make the purchase at 6½ cents for prompt delivery equal to an advance of 100 per cent. on the commissary's contract, and 150 per cent. on the contract made by the Indian Office in pursuance of law, after proper public advertisement. I was credibly informed, and believe, that the cattle delivered in November at 6½ cents a pound cost but 2¾ cents at some reservations, 2.85 cents at others, and 3 cents at the most remote. I am offered oxen in full supply for the next season at 2¾ cents a pound, delivered on the banks of the Missouri River, from June 15 to July 1, although the price of cattle has materially advanced in Texas since last spring. The best of the cattle, say 4,000 head, of the 3.88-cents contract, cost 3 cents a pound, because they were bought so late that they could not reach Grand River before the close of November. I was credibly informed, and believe, between two and three thousand cattle under the same contract, were very inferior to the others, and that some of them cost 2½ cents a pound, or less.

"Seventh. The following wrongful and censurable instructions to agents, dated Indian Office, June 18, 1870: 'If the quantity of any or all of the articles delivered should vary from the foregoing, either more or less, it will make no particular difference. You will give Mr. Bosler proper receipts for all the supplies furnished by him at the time of the delivery.' 'The foregoing instructions' notified the agents at Whetstone that one-third of the cattle would be delivered, each, about July 15, August 1, and September 1, 1870. Mr. Bosler notified the agent that he would thrust upon him about one thousand cattle by July 20. The agent remonstrated, as he had then nearly three months' supply on hand. A telegram from the honorable Commissioner of Indian Affairs, dated July 20, 1870, compelled him to receive from J. W. Bosler all the cattle he brought, say 839 head, in addition to the 1,200 already on hand at the agency. The agent reports that these additional cattle will cost him $600 per month for herders, in addition to stampeding and other casualties. As these letters of instructions show that the contractor might deliver in July, August, and September, a plea that the contract for supplies was made to meet an exigency has no foundation in fact; and the reason for this very peculiar clause became manifest on this, and especially on subsequent occasions, for deliveries of 6½-cent cattle were made in November, and attempts were made in the same month to force 7,000 additional oxen on the agents, contrary to contract.

"Eighth. The neglect to advertise for proposals to furnish cattle, immediately after

the passage of the appropriation bill, July 15, is not culpable, but seems to be something worse, when coupled with the fact that additional cattle, to the extent of more than $155,000, were purchased privately on or about August 20, and were allowed to be delivered as late as November 14, when, under the advertised contract, cattle were to be ready for delivery as early as the 15th of October, at 3.88 cents a pound.

"Ninth. Neglect in not notifying the Second Auditor of the receipt of a notification from Agent Randall, of Cheyenne, that his sub-agent had receipted for Texas cattle at twelve hundred pounds, instead of nine hundred and thirty-eight pounds, the actual weight, &c. Also, culpable remissness in paying large sums of money on vouchers from irresponsible persons, not officially known to the Department, said vouchers not giving the number of the cattle, or stating whether they had been weighed or estimated, and by whom, or, in the case of net weight of beef, whether the oxen had been killed, or how the estimate had been made.

"Tenth. Neglect in not sending a copy of the contract of September 17 to the various agents, as had been done with the private Bosler contract. The instructions of June 18, to receive without restriction, had not been revoked, but had been strengthened by the telegram of July 20, from Commissioner Parker, ordering Captain Poole to receive without limit. That there was a collusion in an attempt to defraud the Government is more than probable from the following reasons: 1. J. W. Bosler, the contractor at 6½ cents, is also a partner in the contract of September 17, at 3.88 cents, and he avers that Governor Carney, the representative of another ring, or combination of bidders, offered $40,000 if the bid of 3.88 was withdrawn. 2. A nine months' supply of oxen, say nearly 7,000 cattle, would not have been driven to the Missouri region in November if the contractors had expected to be held to their bargain. 3. No preparations were made by the contractors to keep the cattle, or to kill them and freeze the beef. That is, no hay was provided, no horses purchased, no herders hired, and no houses erected for protecting frozen beef. 4. A partially-successful attempt was made by the contractors, or their agents, to force these cattle on the Indian agents; and they would have been largely, or perhaps wholly successful, if I had not, when in Washington, demanded to see the contract, and was therefore prepared to caution the Indian agents. Before I reached Crow Creek some 400 of these cattle had been forced on an agent who had already resigned. He averred that he had given a temporary receipt under false representations. These new cattle caused his whole herd to stampede.

"Eleventh. Wastefulness of the public money in purchasing other articles, all from the same favored contractors; say bacon, (with the rib bones,) at 25 cents per pound; coffee at 28 cents per pound; common sugar, made from molasses, at 18 cents per pound; inferior tobacco at 85 cents per pound, and flour at 6½ cents per pound, delivered at the agencies. Also, in buying from the same person, a resident in Pennsylvania, 25,000 ninety-eight-pound sacks of second-quality flour, at $3 50 a sack, delivered at Sioux City, where the market price was $2 20, purchasing all privately from one person instead of advertising according to law, and not allowing bids of one thousand sacks or more, that persons living near the reservation might find a market for their products and manufactures. Wheat could have been contracted for at from 1 to 1½ cents per pound, and a more nutritious diet manufactured on the reservation, with existing machinery, at less than half the cost of the flour furnished.

"Twelfth. Exorbitant rates paid for freight up the Missouri River, by not encouraging or allowing competition.

"Thirteenth. Grievous wrongs to the Indian service by allowing peculiar facilities to a superintendent or superintendents, agent or agents, having strong political friends, by which the Government has been defrauded or the welfare of the Indians retarded.

"WM. WELSH.

"PHILADELPHIA, *January* 9, 1871."

To the charges General Parker replied as specifically as possible, in a communication dated January 13, as follows:

"WASHINGTON, D. C., *January* 13, 1871.

"DEAR SIR: I have the honor to acknowledge the receipt of your communication dated January 11, 1871, in which, by instructions of the Committee on Appropriations of the House of Representatives, you forward me, inclosed, a copy of a communication of William Welsh, esq., dated Philadelphia, January 9, 1871, and stating that you will receive any reply that I may be pleased to make.

"I do not understand, from your communication, that I am personally or officially called upon to answer before your committee for any misconduct in office, or that, beyond the accusations contained in the letter of Mr. Welsh and matters connected therewith, there is anything pertaining to my administration, as Commissioner of Indian Affairs, into which you propose an investigation. I address myself, therefore, at once to the charges made by Mr. Welsh.

"First. That I made extensive purchases of cattle, flour, groceries, &c., about June 17 and August 20, 1870, and at other times, in violation of law, I deny.

"Second. That I made large purchases a month before the passage of the appropriation bill, (of July last, I suppose he means,) without warrant of law, and not warranted by any exigency, I deny.

"Third. That I made purchases, in violation of section 3, appropriation act, approved July 15, 1870, I deny.

"Fourth. That I violated said section 3, by reason of matters contained in said charge, I deny.

"Fifth. That there was any culpable neglect, on my part, in not ascertaining the quantity of supplies likely to be furnished by the Commissary Department, before making purchases June 17 and August 20, 1870, I deny.

"Sixth. As to many of the allegations in charge sixth, I have no knowledge. That I purchased beef cattle in July and August, 1870, at prices greater than subsequently paid for beef cattle delivered under contract, is true. But my action in the matter was based upon the necessities and circumstances then surrounding me, which I will fully explain to the committee if it is desired.

"Seventh. That I issued any wrongful and censurable instructions to agents, relative to receiving supplies in July or August, 1870, or at any other time, as alleged, I deny. My instructions are to be found in the Office of Indian Affairs, and will be furnished, together with any explanation your committee may require.

"Eighth. That I was guilty, as charged, of any culpable neglect in the matter of advertising for proposals after the passage of the appropriation bill of July 15, 1870, I deny. As to purchases subsequently to the passage of the act, I will make full answer, whenever informed by the committee that such answer is desired.

"Ninth. That I was guilty of culpable neglect and remissness in failing to give proper notice to the Second Auditor in any matter whatever, or that I was so guilty in paying vouchers of any character, as charged, I deny.

"Tenth. That I was guilty of neglect in not sending a copy of the contract of September 17, 1870, to the various agents, as had been done with the contract of J. W. Bosler, or that there was any collusion between Mr. Bosler and myself, I deny. Whether 'there was collusion in an attempt to defraud the Government' between persons other than myself, as is by Mr. Welsh asserted to be probable, for reasons stated by him, I know not. But that I had knowledge of any such collusion, or had aught to do with it, if such attempt was made, I deny.

"Eleventh. That I was guilty of 'wastefulness of the public money in purchasing other articles from Mr. Bolster,' as alleged by Mr. Welsh, I deny. That I should have provided cracked wheat for the Indians instead of flour, is a matter of policy, in supplying these people, about which there may be honest difference of opinion, and I suppose I need suggest nothing further in reply to the charge that I preferred to furnish flour.

"Twelfth. That 'I paid exorbitant rates for freight up the Missouri river, by not encouraging or allowing competition,' I deny.

"Thirteenth. That I was guilty of 'grievous wrong to the Indian service by allowing peculiar facilities to a superintendent or superintendents, agent or agents, having strong political friends, by which the Government has been defrauded, or the welfare of the Indians retarded,' I deny.

"Your committee will observe, upon reading the charges numbered from one to thirteen inclusive, that in some cases they contain statements of facts of which I have no knowledge; that they abound in inferences of the person making them which do not necessarily follow from the facts themselves; that they cover a wide range of inquiry, not only into particular transactions, but the general policy of the Indian Office; that they are often vague and uncertain in allegations of facts, but of this I care little. There are substantial averments which concern me personally and officially, and all such I stand ready to answer.

"Your committee now have the charges and my reply.

"I suppose the just and proper course in such investigations will be pursued, and that the accuser will be called upon to make good his charges.

"To the extent of all knowledge in my possession I offer my assistance.

"I only ask to be permitted to be present when witnesses are called and have the privilege of cross-examination; to be furnished with a copy of the evidence, if consistent with your rules of procedure; and to be permitted to call witnesses myself to explain any matter deemed important where witnesses may be necessary.

"I have the honor to be, your obedient servant,

"E. S. PARKER.

"Hon. A. A. SARGENT,
"*Chairman Sub-Committee, &c., House of Representatives.*"

I think, Mr. Chairman, that no one who will take the trouble to read the record in this case will doubt the thoroughness of your investigation. Certainly, whatever of knowledge that persistent, patient, and searching inquiry could produce will be found here. The prosecutor, Mr. Welsh, has been denied no facility in any quarter, official or otherwise, which would lead to the discovery of any important fact connected with his

charges. He has had access to the files and records of all the departments and bureaus of the Government, and has used this privilege freely. He has even caused to be brought before the committee the private bank account of at least one person with whom he suspected General Parker may have been in collusion. And I do not doubt that the same zeal which led him into the examination of this bank account has also led him to make the same fruitless search with regard to the private bank account of General Parker elsewhere.

I believe I do not state more nor less than the truth, when I say that the committee, for the purposes of the investigation, proceeded upon the theory that the charges were true, and that it was its duty to establish their truth, if possible, leaving the accused to defend himself without the aid of the committee. No one can read carefully the examination of witnesses without perceiving the truth of this remark. I mention this, Mr. Chairman, with no view of complaining, but rather that no one shall say there was any dereliction of duty on the part of this committee. There is a theory in military prosecutions before courts-martial, that the judge advocate is counsel both for the accused and the Government. But this is impossible in practice, as I think it is impossible for any committee to investigate charges against individuals, with the prosecutor standing at their side, without itself becoming more or less the prosecutor.

But that duty of the committee is discharged. You are now to enter upon a consideration of the evidence as judges. You are to drop the character of investigators, and assume a higher function. To the committee as judges, then, I shall address myself.

The record in the case is a large one, the charges are somewhat numerous, and I do not find it possible to thoroughly analyze the evidence in any very brief space. I trust, therefore, I may be heard patiently through. Recurring to the resolution introduced into the House, as well as the charges preferred by Mr. Welsh, the basis of this prosecution, I find what contains the basis of inquiry. The House resolution directed inquiry into the following matters:

1. To inquire and report what effect, if any, has been given to the third section of the appropriation act approved July 15, 1870, which is as follows:

"And it shall be the duty of said commissioners (referring to the board of commissioners created by the act approved April 10, 1869) to supervise all expenditures of money appropriated for the benefit of Indians in the United States, and to inspect all goods purchased for said Indians, in connection with the Commissioner of Indian Affairs, whose duty it shall be to consult said commissioners in making purchases of such goods."

2. As to what amount of moneys have been expended on goods purchased in disregard thereof.

3. Whether the contracts for the purchase of flour or beef cattle for the Indian tribes on the Missouri River have been corruptly or improvidently made, or for greater quantities than required for the service.

There are many things stated in the series of charges presented by Mr. Welsh upon which no proof has been adduced. I suppose I need only present those questions for consideration which seem to have been regarded as important by the committee, and upon which evidence is to be found in the record. Laying out of view, then, entirely for the present, the order in which the charges are presented, or matters of inquiry mentioned by the House resolution, I will endeavor to take up, as near as may be in order of time, the several official acts of the Commissioner of Indian Affairs of which complaint is made.

J. W. Bosler's contract, June, 1870.

First, then, as to the contract made on the 17th of June, 1870, with J. W. Bosler for the supply of beef, bacon, flour, coffee, sugar, salt, soap, and tobacco, to the various Indian agencies along the Missouri River, from the lowest or Yankton agency to the highest or Grand River agency. It is alleged that this contract was made in violation of the third section of the appropriation act approved July 15, 1870. But this allegation need not be considered, as the contract was made previously to the passage of the act. And if it should be said that, notwithstanding this fact, yet the supplies delivered under the contract should have been inspected by the board of commissioners where the delivery occurred after the passage of the appropriation act referred to, I answer that the supplies, except beef, were all delivered before the passage of the act. As to the beef I will reply further along.

It is also alleged that this contract was made in violation of law, in that the supplies or provisions embraced in it were not advertised for, and the contract was made in the absence of any exigency warranting it. The provision of law with regard to the making of contracts is as follows:

"All purchases and contracts for supplies or services in any of the departments of the Government, except for personal services, when the public exigencies do not require the immediate delivery of the article or articles, or performance of the service, shall be made by advertising a sufficient time previously for proposals respecting the

same. When immediate delivery or performance is required by the public exigency, the articles or services required may be procured by open purchase or contract at the places and in the manner in which such articles are usually bought and sold, or such services engaged between individuals." (Sec. 10, act March 2, 1861, 12 Stat., p. 220.)

It will be perceived that the same law requiring advertisments authorizes the making of contracts where an exigency exists. It then becomes a question only as to what constitutes an exigency. Now, I take the position, Mr. Chairman, that we are not bound to show an exigency to have existed. It is sufficient to show that the officer believed an exigency upon him and acted with reference to it; and unless it appears that the officer acted corruptly, we have no right to question his judgment in the premises. The administration of Indian affairs is peculiar to itself. Indeed, it can hardly be said to do violence to reason, by assuming that exigencies in the Indian service constantly arise, and that the Bureau of Indian Affairs could not well be managed if the strict letter of the law were pursued in all cases.

This question of exigency has much to do with the inquiry now before us; and that the theory of it here presented may be shown to be not new, I desire to refer to adjudicated cases in courts.

I call attention to the case of The United States *vs.* Speed, 8 Wall., 77.

This was a suit upon a contract made by Major Simonds, a commissary in the Army, for slaughtering hogs for the Army at Louisville, in 1864. No advertisements for bids or proposals were put out before making the contract.

The validity of the contract was afterward denied, and suit was brought in the Court of Claims, and judgment rendered in favor of the claimant.

The United States appealed to the Supreme Court, and at the trial, among other objections to recovery, the Assistant Attorney General plead the act of March 2, 1861, (12 Stat., 220,) and urged that the contract was not binding, because there was no advertisement for proposals.

The Supreme Court, by Mr. Justice Miller, says:

"But that statute, while requiring such advertisement as the general rule, invests the officer charged with the duty of procuring supplies or services with a discretion to dispense with the advertising, if the exigencies of the public service require immediate delivery or performance.

"It is too well settled to admit of dispute at this day, that where there is a discretion of this kind conferred upon an officer or board of officers, and a contract is made in which they have exercised that discretion, the validity of the contract cannot be made to depend on the degree of wisdom or skill which may have accompanied its exercise."

The learned justice cites Pha. and T. R. R. Co. *vs.* Stimpson, 14 Peters, 448; Martin *vs.* M—t, 12 Wheaton, 19; Royal British Bank *vs.* Turquand, 6 Ellis and Blackburn, 327; Reas *vs.* Reed, 1 Wheaton, 482; 25 English Law and Eq. R., 1 4.

I cite also V——— *vs.* Young, 11 Johnson, 158; Wilkes *vs.* ———, 7 Howard, 89; Gould *vs.* Hammond, 1 McAll, 235.

I cannot now stop to examine adjudicated cases. The law, however, is well settled, and no lawyer will dispute it, that where a discretion is devolved upon a public officer he is the sole judge of the facts which move him to the exercise of that discretion. No one at the time can question his judgment and *a fortiori* can no one afterward assume to say he acted unwisely.

But this case does not rest upon abstract principle unsupported by fact. Commissioner Parker did not make this contract without the strongest reason impelling him. It is in evidence that early in the spring, when the leading representatives of the Sioux Indians were at Washington, the importance of keeping ample supplies for those Indians along the Missouri River who were disposed to come in and submit themselves to the workings of the President's policy, which contemplates feeding rather than fighting the Indians, was fully discussed; and the faith of the nation was pledged, through its Executive, that there should be no failure on the part of the Government in carrying out its promises in this particular. An arrangement existed by which these Indians were being fed by the Commissary Department; but this arrangement was to conclude on the 30th of June, and the correspondence between the Interior Department and the War Department, in the latter part of May and the 1st of June, shows that beyond this time the Indian Bureau could not look to the Commissary Department for supplies.

See letter of Commissary General Eaton, May 27, 1870; letter of Commissioner Parker to General Eaton, June 1, 1870; letter of Commissioner Parker to Governor Burbank, superintendent of Indians for Dakota Territory, June 1, 1870; requisition of Lieutenant Woodson, acting commissary of subsistence at Whetstone agency, June 4, 1870; letter of Acting Commissary General of Subsistence Clarke, of Military Division of Missouri, to General Eaton, June 15, 1870; letter of General Eaton to the Secretary of War, June 8, 1870; letter of Adjutant General Townsend to the Secretary of the Interior, June 18, 1870.

In one of Governor Burbank's letters, (June 18,) he says:

"Allow me to call your attention to the statement of Major Hearn, that the flour,

bacon, sugar, and coffee will last only to July 1. You are well aware that we must feed or fight the Indians in this superintendency, and, by failing to have full supplies on hand, we furnish the disaffected with an argument, or pretext at least, to compel those who are disposed to be friendly to join them.

"I trust that you have the means at your command to send a full supply at once; but, if not, I hope that you may devise some means whereby subsistence can be kept on hand at this and all the other agencies."

Agent Hearn, from the Grand River agency, June 2, 1870, writes:

"I earnestly request that supplies be forwarded as soon as possible, as the deportment of the Indians deserves that the Government should promptly comply with the conditions of their treaty."

Again, July 1, Agent Hearn writes:

"We are entirely out of flour and bacon. * * * Many Indians are dissatisfied, and think the Government is going to stop feeding and clothing them, as their supply of provisions for the coming year has not arrived, and they are living on corn and beef. I respectfully request that supplies be forwarded as soon as possible, if they are not already on the way."

Agent Hearn writes from Grand River agency, July 31.

"I received provisions on the 15th of July, and the Indians were very well pleased, as a great number supposed that the Government was going to stop feeding them."

To go back in point of time, we find Captain French, agent at Crow Creek agency, writing as follows, June 7, 1870:

"SIR: I have the honor to report that the supply of bacon for the agency was exhausted on the last of March, and that I have but three weeks' issues of sugar and coffee on hand.

"The bacon is an indispensable article with the Indians, without which they cannot cook their flour, they having no baking powders, nor the means to purchase them with, and have to rely entirely upon grease to make their bread rise.

"The Lower Yanktonais at this place will be left in a very destitute condition should Congress fail to make an appropriation for their support. There is no game on their side of the Missouri River, and were they to hunt upon the territory of the Teton Sioux, they would be massacred by the hostile Indians.

"Very respectfully, your obedient servant,

"WILLIAM H. FRENCH, JR.,

"*First Lieutenant and Brevet Captain U. S. A., U. S. Indian Agent.*

"Hon. JOHN A. BURBANK,

"*Governor and ex-officio Superintendent Indian Affairs, Dakota Territory.*"

Governor Burbank, superintendent of Indian affairs, Dakota Territory, forwards a letter, June 11, in which he says:

"Allow me to most respectfully request that you take the proper steps to have a supply of the articles named sent at the earliest moment possible."

On the 15th of June Major Goodhue, the agent of the Yankton agency, writes to Commissioner Parker, submitting an estimate of provisions necessary for that agency, and remarks:

"I cannot too strongly urge upon the Department the importance of making provisions for the Indians of this agency, commencing with the month of July. All the rations provided for them under contract of last year will have been consumed by that time, and, in my judgment, if the Department should cease to feed them at this time, the Indians will scatter, many of them joining the disaffected Sioux, who are now committing depredations along the line of the Union Pacific Railroad. The Indians of the upper agencies are constantly taunting the Yakntons with a statement of the fact that they, (the Yanktons,) who are peaceable and friendly to the whites, have never received the presents and provisions from the Government that they, the hostile and unfriendly ones, have. If the Government should feed the Indians of the Whetstone, Cheyenne, Crow Creek, and Grand River agencies during the coming year, and withhold supplies from the Yanktons, it will result in the disintegration of the tribe, and have a strong tendency to alienate the friendly feeling now existing toward the Government. And if perchance there should be an uprising of the Sioux Nation this year, the Yanktons, smarting under what they deem the neglect of the Government, would in all probability join the hostiles. It is of the first importance, in view of the past and present efforts to advance these Indians in civilization, to pursue a policy that will induce them to remain contentedly on their reservation. If they become scattered and disaffected, in a very short time they will relapse into the same degree of wildness and barbarism that now characterizes their brothers of the Upper Missouri.

"In view of these facts I would earnestly invite the attention of the honorable Commissioner of Indian Affairs to the importance of making ample provision for subsisting the Yankton Indians."

I have given here but a small portion of the evidence tending to show the emergency under which the Commissioner made this contract in June.

In his examination before the committee, in reply to a question put by Mr. Beck, as follows: "What was the exigency that required a contract of that magnitude?" he replied: "The Sioux of Missouri, in 1870, had five agencies along the Missouri River, covering a distance up and down the river of, I suppose, between six and eight hundred miles. They had recently come into these agencies and located under the stipulations that they should be subsisted there according to their treaty with the peace commission. In the appropriation bill for the fiscal year ending June 30, 1870, was the appropriation of two millions in bulk for the use of the Indians generally. After the passage of the appropriation bill an arrangement was made with the Commissary Department of the Army to subsist the Indians wherever it was necessary, to be paid out of that two million fund. These Sioux Indians, while they were not really friendly, were not absolutely hostile. The appropriation bill was hanging here in Congress. On the 15th of June, two weeks before the arrangement with the Commissary Department was to terminate, we saw before us very serious difficulties. If the office took no action at all for continuing the supplies after the Commissary's had ceased, we feared the Indians would either leave the agencies or subsist themselves by depredating upon what they could find about them. We did not want them to leave the agencies, or enter into any kind of depredations. My idea was, that if we could subsist them for three months, we could in the ordinary routine of the office be able to make regular arrangements for subsisting them after that time. And in making this contract of the 17th of June, my intention was to cover the exigency which then seemed to arise for subsistence for about three months from the 1st of July."

I cannot believe that any one will seriously doubt the presence of an exigency at this time, or the duty of the Commissioner to meet it. On the contrary, he would have deserved censure not to have acted promptly and boldly to meet the impending danger; and as he has testified that he acted up to his best judgment, and with the best guides then within his reach, he ought not now to be called to answer for his conduct. But it may be said that he acted improvidently, and involved the Government in a wasteful expenditure of public funds. If he did this, but did it honestly, he ought not to be blamed. Yet it might be urged that he is unfit to hold the position he occupies on this account, admitting that he is not morally culpable. It then becomes necessary to notice whether he did, in fact, act improvidently; whether he paid too great a price for the supplies purchased by him. As this question of prices for supplies purchased runs through subsequent transactions, I will treat of that as a separate subject, and not stop here to discuss it. I cannot see that any question as to the magnitude of purchases can be made, except it shall be shown that they were greatly in excess of the requirements. An exigency is not to be judged of by the proportions. It may require a large outlay of money, or a small one, but the magnitude of the expenditure can have nothing to do with the exigency. It must be borne in mind that there were many thousands of these Indians; that the number varied. The policy of the Government was to invite all to come into the agencies who might choose to do so. To show this I quote from a letter of Major Randall dated April 9, 1870, in which he says:

"I have the honor to state that I am at present subsisting six thousand five hundred Indians at this agency, (Cheyenne,) and, at the least calculation, three thousand more than was expected here for subsistence, and they are daily arriving."

I might further quote from testimony to show that the prompt action of the Commissioner probably saved an outbreak, but I do not see that question will be made now of the fact that he wisely met the emergency, except as to the means by which he met it.

PURCHASE OF BEEF FROM J. W. BOSLER.

There is, perhaps, more question made as to the price paid for beef than any other item of purchase inquired into by your committee, and as the amount of beef in quantity and in value was quite large, I deem it important to examine at some length the testimony upon this point.

There were but two purchases of beef about which question is made—one of June 17, 1870, by contract with J. W. Bosler, at six and one-half cents a pound, gross; and the other by an extension of that contract, dated August 10, 1870. I quote from the Commissioner's testimony with regard to prices, (p. 19:)

"Q. You speak of having inquired; what means did you take on the 17th of June or thereabouts, to ascertain the lowest prices at which cattle could be furnished?—A. For several weeks previous to the 17th of June, I had been in the habit of talking almost daily with parties visiting my office, upon the subject of whether articles of subsistence could be had for an emergency in the region of these agencies, and, in my own mind, I had come to some conclusion as to what we would have had to pay, in a sudden emergency, for these articles of supply. The only means I could take was conversation with parties who were familiar with the country, and who were dealing in cattle."

There was at the time a contract in existence with the Commissary Department, by which beef was being snpplied to these agencies and to the Commissary Department at 4.44 cents gross. That contract had been let the year previous, and ran during the years 1869–'70, and expired June 30, 1870; but, as we have seen, the arrangement by which the Indian Department could be supplied under that contract expired at that time, and could not be continued. I quote from the Commissioner's testimony, (p. 25,):

"Q. What price was the War Department paying that commissary contractor at that time?—A. Four and forty-four hundredth cents.

"Q. To be delivered at the agencies?—A. Yes, sir.

"Q. Why did you pay 6½ cents when these commissary contractors were furnishing it at these agencies at 4.44?—A. No such offer was made to me. I got the impression from my daily intercourse with these people, that they did not want to supply any more at that rate; that they had lost money under their arrangement with the Commissary Department, and I had the impression that they would not do it.

"Q. Did you make any effort to ascertain whether or not you could have continued to have received supplies during this contingency that occurred at 4.44 or at the rates at which the Commissary Department had been supplied?—A. I talked with the Commissary General about it.

"Q. Who was he?—A. General Eaton. I had frequent conversations with him."

I have no doubt that this commissary contract has been put in evidence for the purpose of instituting a comparison between the price paid under it and that paid by Commissioner Parker, the difference being a trifle over two cents a pound. The Commissioner doubtless knew the price paid under this commissary contract, but there is no evidence showing that he had any personal knowledge of the contractors, or any personal intercourse with them, by which he could ascertain whether they were prepared to supplement their contract at the same rate in an emergency, and under the circumstances surrounding the Bosler contract. This commissary contract was let the year previous, upon ample notice by advertisement, and provided for deliveries through the succeeding year. The contractors had every opportunity to take advantage of markets and provide themselves with the means of complying with their contract. It does not by any means follow, because that contract existed during the years 1869–'70, and expired the 1st of July, 1870, that therefore the contractors were willing to furnish the large amount required immediately at the same rates. Indeed, it is very probable, if they desired to do so, some representative of the parties interested in that contract would have made known their wish to the Indian Bureau at the time. Nothing of the kind is shown, and I think by no fair comparison can that contract figure in this investigation, further than as showing the fact that a contract had been in force the year previous, at the rate of 4.44 cents gross; but it must be remembered that the contract provided for supplying not only the agencies along the Missouri River, but for various posts of the Army, and at points more accessible than these agencies, and where the delivery of cattle would cost less and involve fewer risks. These posts were also included at the same rate of 4.44; and to show that the rate of 4.44 does not necessarily govern and does not show the maximum price which would be reasonable for these agencies, I call the attention of the committee to an extract from the report of the Commissary General, printed in the report of the Secretary of War to Congress for 1870, on page 266, in evidence here, (p. 152.) It is shown that the average price paid for beef in Dakota Territory, for the years 1869-'70, was 4.88 gross; and this also embraced military posts which were more accessible than the Indian agencies referred to. This beef was furnished after ample time for advertisements, and where the deliveries ran through the year.

I call the attention of the committee also, in this connection, to a table referred to in the testimony of Colonel DuBarry, an officer of the Commissary Department, (p. 99.) At Omaha, for the years 1869–'70, the Department paid 4.45 gross; at Fort Kearny, 5 gross, for the present year, 5½; Fort McPherson, 1869–'70, 5 gross; North Platte, 5 gross; Sidney Station, 5 gross; Fort Sedgwick, 5 gross, present year, 5 gross; Fort D. A. Russell, 5 gross; Fort Laramie, 5 gross; Fort Fetterman, 5 gross.

In May, 1869, the Commissary Department purchased in open market, to be delivered in June, 1869, for the Yankton and Ponca Indians, two lower agencies, at $5 75 gross; and in April, 1870, to be delivered in July, 1870, for these Indians, at $4 75 gross; again, in April, 1870, to be delivered in July, for these Indians, another purchase at $5 90 gross. In August of 1870 another purchase was made to be delivered in October, 1870, for these Indians at five cents gross; another purchase, to be delivered in July, 1870, at $5 15 gross. These last-mentioned purchases were made upon advertisements and proposals. In May, 1869, to be delivered in July, 1869, there were purchased for the Whetstone Creek agency and the Cheyenne and Grand River, 825 head, at 5½ gross.

It is in evidence that the prices of 1868, 1869, and 1870 did not materially vary. The table from which we have been quoting will show that the prices being paid for this year are in some instances higher than last year. It will be remembered by the committee that a considerable difference is made between delivering cattle along the line

of the Pacific Railroad (and the forts which we have named are along that line of road) and at these various Indian agencies along the Missouri River. That difference I will hereafter notice; but when we come to add to the prices paid by the Commissary Department the difference in delivering at the Indian agency, it will be seen that the price paid by Commissioner Parker was not high; indeed, if the testimony is to be credited, he paid less than the prices along the Pacific Railroad, with the difference added.

To return a moment to the commissary contract at 4.44, which, doubtless, will be kept constantly before the committee, I desire to call attention to the testimony of Mr. Hedges, a cattle dealer. I quote from his testimony, (p. 65:)

"Q. Did you sell any beef to the contractor who was supplying the Commissary Department for the various posts up the river last year?—A. I had a half interest in the 400 head of cattle sold to Colonel Denman last spring.

"Q. Were they sold to fill the Fenlon contract?—A. That is what he said.

"Q. What did you sell for?—A. Five cents, at Sioux City.

"Q. As they came from the scales?—A. Yes.

"Q. When was that?—A. I think it was in the month of May; he had exhausted the supply on hand, and this purchase was to fill up.

"Q. At the time you made this sale, were there other cattle in the market in Sioux City?—A. Yes, in the vicinity.

"Q. Do you know whether Colonel Denman had made efforts to get cattle?—A. Yes; he said that he found mine to be as cheap as any that were offered. H. T. Booge & Co. had a half interest in this 400 head.

"Q. What was the difference, if any, between the prices of cattle in Sioux City in May and in June, 1870?—A. There was very little change in that time." (See also p. 109, testimony of J. W. Bosler.)

I do not urge that from this circumstance it is to be inferred that the commissary contract was too low, but I do say that it shows the commissary contract not to be an unfailing guide; for it is quite sure that there was no money in a contract for beef delivered in that remote region along the Missouri River at 4.44 which was filled by purchases at five cents at Sioux City.

It is in evidence also (p. 102) that the Sherman-Harney peace commission paid in 1868–'69, 7.90 gross for supplying these same agencies, which was one cent more than was being paid by the Commissary Department for their regular supplies at that time. I am aware that the committee thought that incompetent testimony, as tending to show the price of beef in 1870, but the evidence is that the price did not materially vary during those years, and I still insist that the testimony is competent. But leaving out of view comparisons with contracts in existence prior to and at the time the Commissioner made his, let us examine what seemed to be to the committee the best evidence of the prices of beef at that time. This, it will be remembered, was arrived at by ascertaining the price of beef along the line of the Pacific Railroad, where the market is steady and the supply of beef somewhat constant.

It is in evidence that the price of cattle at Omaha and Sioux City and at Schuyler, along the railroad, are to some extent controlled by the prices ruling in Chicago, that is, the price would be the price at Chicago, less the freights and commission. The cost of shipping is about a half a cent a pound, and the commission 50c ents a head. (Pp. 66 and 109.)

On pages 185 and 186 will be found the prices current for the cattle in Chicago in June. 1870. The prices there given are gross weight. The sales for June 15, 1861 head, range from $6 75 and $7 for light cattle, to $9 for extra and prime shipping beeves per hundred, gross, (see testimony of J. W. Bosler, p. 109.) June 18, sales 875 head, $3 25 to $4 50 for common to fair Texan steers; $4 to $6 65 for stock and butchers' cattle; $6 25 to $8 25 for fair to choice; $8 45 to $8 60 for extra shipping steers. Market active, but prices low and variable. June 20, receipts 2,005 head; sales, 997 head, at $3 75 to $5 25 for Texan steers and native cows; $5 50 to $6 50 for fair to good butchers' steers; $7 to $7 87½ for good to choice; $8 to $8 87½ for extra shipping steers. June 22, receipts 1,617 head; sales 515 head, from $6 to $7 12½ for light to fair, $7 50 to $8 50 for good to choice. June 27, sales 1,618 head; $3 25 to $6 10 for Texan steers and cows; $6 75 to $7 62½ for fair to medium; $8 to $8 75 for good to extra shipping steers. Premium lot, averaging 1,403 pounds, sold at $9 25. June 29, sales 1,040 head, at $4 25 to $6 for common to fair cows and light steers; $6 25 to $7 50 for medium to good; $7 87½ to $8 25 for good to choice fleshy steers. June 30, receipts 2,130 head; sales 962 head, $6 to $7 for fair to medium; $7 25 to $8 25 for good to choice; $8 50 to $9 for extra premium shipping steers.

The cattle furnished by Mr. Bosler under his contract did not come within the grade of common or light steers, or fair cows, or stock cattle, but belonged to that class denominated good to medium. They averaged over a thousand pounds each, and, according to all the testimony in the case, Texan cattle averaging that are to be considered among the higher-priced and better classes of Texan cattle. Now, if we deduct half a cent a pound from Chicago prices, and the trifle of fifty cents a head commission

for selling, and something possibly for loss of weight, it will not be possible to bring the prices upon that basis along the Pacific Railroad, west of the Missouri River, below four and one-half cents a pound gross, and that is what Mr. Bosler paid for the cattle which he delivered under the contract.

Leaving the Chicago prices, let us examine the testimony of witnesses as to the value of beef cattle in the beef markets west of the Missouri River. I quote from the testimony of Charles E. Hedges, cattle dealer, resident at Sioux City, Iowa, (p. 65:) "has been in the business largely for six years."

Attention has already been called to the fact that this witness sold beef at five cents at Sioux City to fill the commissary contract.

I quote again from this witness:

"Q. Did Mr. Bosler apply to your firm for cattle in the latter part of June, 1870; and, if so, what were your prices?—A. He asked us what we would furnish cattle for, and we told him at 4½ cents a pound. That was in June, 1870, at Sioux City."

The cattle furnished by Mr. Bosler, for which he received 6½ cents, he bought at 4½ cents a pound, he to furnish escort, and to be responsible for all damages from Indian raids, (p. 62.) These cattle were bought in the neighborhood of Schuyler, on the Pacific Railroad.

In Mr. Walter A. Burleigh's testimony, (pp. 89, 90,) reference is made by him to a small contract for furnishing beef to the Santee agency, which was the lowest down of those furnished by Mr. Bosler. This was in 1869 and 1870. He was paid at the rate of 7.22 net. The kind of cattle furnished by him, he says, were cows, calves, yearlings, and steers; a very different class of cattle it will be remembered from those furnished by Mr. Bosler, and of much less value in market. They were butchered upon his farm, and he retained the hide, tallow, &c. His contract, he says, amounted to some $16,000 or $18,000; but he says (p. 92) that he lost $6,000 on it.

"Q. What was the occasion of that loss?—A. I took the contract too low, and I lost some cattle.

"Q. By stampeding?—A. Not altogether, but because I took it too low."

The witness also speaks of having made a proposition in March to supply these agencies at four cents, but the proposition itself is not in evidence, nor is the reply of the Indian Bureau. The proposition was not renewed, and cannot be fairly considered in connection with this investigation. It looked to the supply for the succeeding year, and looked also to the fact of his having ample time to make his preparations and his purchases accordingly.

This witness was asked by the chairman what he would have supplied the beef under the Bosler contract for, and assuming that the deliveries were in three installments—the first on the fifteenth of July, the second the first of August, the third the first of September—he answers:

"A. I do not think I would have delivered the first installment for less than 6½ cents, the second installment less, and the third installment still less.

"Q. How much less would you have delivered the second installment for?—A. I think a cent a pound less.

"Q. How much less the third installment?—A. I should think there would be half a cent more.

"Q. So that the first installment would be 6½ cents, the second 5½, and the third 5 cents?—A. Yes, sir. I believe I would have taken the contract for that, with the assurance that the money was to be paid as soon as the cattle were delivered."

But it will be remembered that the cattle were not delivered in installments, but were delivered at one time under this June 17th contract; and according to Mr. Burleigh's testimony 6½ cents was a reasonable price.

By the testimony of John Finn, (p. 99,) if his testimony is to be considered in this case, it will be seen that he got 3½ cents gross for cattle delivered at the Winnebago agency, which is below Sioux City. These cattle were like those furnished by Mr. Burleigh, and were what the witness denominates "common run;" that is, some cows and some steers.

This witness offered to furnish at the Whetstone agency, one of the lower agencies, at 4½ cents gross, which I suppose should be taken into consideration in arriving at the prices of beef, although it by no means follows that he would have complied with his offer had it been accepted.

Without stopping now to make further reference to the testimony as to the prices of beef along or near to the line of the Pacific Railway, I think sufficient has been shown to show that 4 or 4¼ cents a pound would be a fair price for beef at that time, in the beef-markets along that line of railway. With this as a foundation, let us ascertain from the testimony what would be a fair price for beef delivered at the Indian agencies alluded to. It is well to remember that the dangers increase as you advance up the Missouri River. The country is wild and uninhabited, and open to incursions from hostile Indians. Many witnesses have explained what the risks are, and how sometimes a trifling circumstance will stampede a herd of cattle, which will result in total loss. One Indian emerging suddenly from ambush with his blanket raised in the

air, and with an Indian yell, would stampede a whole herd. All of the witnesses who have spoken of the risk attach the greatest importance to that arising from stampeding; but without explaining this more fully, as it is familiar to all. I will only call attention to the computation made by witnesses, so as to arrive at the money value, so to speak, of this risk.

Mr. Ward, a witness familiar with the whole country and particularly with the risks of driving cattle among the Indians. I quote from this witness, (p. 16:)

"Q. Can you state the difference between the price of furnishing beef along the line of the Pacific Railroad and in furnishing it on contract for the posts running from Yankton up to Grand River?—A. Taking the risk and everything, I should say not less than seventy-five per cent. in favor of furnishing beef along the line of the road."

[The printed testimony says "75 *cents*," but the committee will remember, and the error is a patent one, that the testimony was "75 *per cent.*"]

"Q. Upon what do you base that difference?—A. Upon the risk of capture by the Indians, of crossing the streams, and of the stampeding of the cattle.

"Q. Have you had experience to enable you to speak of that matter from your own observation in that country?—A. I think so; that is as little as I would be willing to do it for."

In this connection, I may as well, perhaps, as elsewhere, give the opinion of this witness as to what he would have furnished cattle for to these agencies:

"Q. State as nearly as you can the value of beef in that country in June, 1870; what would be a fair price for supplying the Indian posts from Yankton up to Grand River?—A. There is a difference between Texan cattle and American cattle. I should not be willing to take a contract for less than seven cents to deliver them along up at the different posts."

I quote from the testimony of Mr. Hedges, (p. 65:)

"Q. What percentage would the risks and expenses of delivery from Sioux City, up the Missouri River, at the various agencies, reaching as high as Grand River, be beyond delivering the same cattle at Sioux City?—A. It would be owing a great deal to a man's luck. I suppose somewhere from 20 to 40 per cent., I think."

I quote from the testimony of the witness, A. C. Leighton:

"Q. State what per cent. of difference you would make in filling a requisition to deliver goods at the Indian agencies along the Missouri River, extending up as high as the Grand River agency, and delivering them along the line of the Pacific Railroad?—A. I have never delivered goods in that country, but I consider the risk a great deal more. I would consider it at least a hundred per cent. in advance of delivering them on the line of the railroad.

"Q. Why would you consider the risk greater?—A. From my experience in delivering goods in the Indian country, I would require at least one hundred per cent. more for delivering them in the country you speak of, than along the line of the Pacific Railroad, whether cattle or anything else.

"Q. Do you know the dangers that are involved in driving cattle through the Indian country?—A. I do, for all kinds of stock. I have been in the Indian country ever since posts have been established along up there. I was at the Powder River post and in that country until the abandonment of that post."

By Mr. SARGENT:

"Q. Have you ever bought and sold cattle?—A. No; I never had anything to do with cattle.

"Q. And never had any delivered in that way?—A. No, sir."

By Mr. CHIPMAN:

"Q. But I understand that you know something about the risks that are involved?—A. Yes, I have never driven cattle, but I have driven horses and mules, and am familiar with the risk attending the driving of any description of stock.

"Q. On what data do you base your estimates?—A. I make them from my own experience in driving horses and mules, and in supplying any kind of goods."

As further illustrating this difference, I might again refer to the testimony of John Finn, who furnished cattle at the Winnebago agency, which is near the Pacific Railway, at a cent less than he offered to furnish at one of the lower agencies above the Pacific Railroad, and where the risk would be comparatively little to those attending the driving of cattle as far up as Grand River. This is also illustrated by the testimony of Mr. Hedges, who furnished beef of the character which Finn supplied under his Winnebago contract, which were a low grade of cattle, at 3½, while he was selling cattle of a better quality at 4½ and 5, and makes a difference of from 20 to 40 per cent. in the delivery at the upper agencies and at Sioux City; and this difference may also be arrived at from the testimony of Dr. Burleigh, who makes a difference of two or three cents a pound.

The committee will perceive how widely the witnesses differ in this estimate. Mr. Hedges says it depends a great deal upon luck, and he estimates from 20 to 40 per

cent. difference; Mr. Ward puts it at 75 per cent.; Dr. Burleigh about the same; Mr. Leighton at a hundred per cent. If we take 50 per cent. as the average, (and that would seem to be a fair one,) we will find the amount paid to Mr. Bosler, of 6½ cents, to be less than the price of beef cattle along the Pacific Railroad, with 50 per cent. added. In this estimate I have left entirely out of view the circumstances under which Mr. Bosler made his contract. I have said nothing with regard to the risks on account of there being no appropriation at the time; for while this is an important element with contractors, and did enter into the contract of June 17, it could not be said to have done so in the extension of that contract of August 10; and I believe that consideration may be laid entirely out of the question, and the price of beef under both contracts be found to be a fair one. Certainly it is in the contract of June 17.

But there is an element which may also be considered in this connection as enhancing the price of beef, and that is the ordinary delays of payment. It has been said by several witnesses that money is worth from one to two per cent. a month in that country. (See testimony of Hedges, Charles, and others.) It is also in evidence that the difference between dealing with a man of prompt payment, such as Mr. Bosler, and with the Government, where nothing but the ordinary delays of payment occur in sending vouchers on to Washington to be audited for payment, that there is a difference of from 15 to 20 per cent. (See testimony of Hedges, Charles, and others.) Any one at all familliar with the transactions of the Government knows that this is but a fair margin to cover contingent delays. Any contractor will tell you that in making his estimates, where advertisements for proposals are published, this delay of payment always enters into his computations. I think, therefore, if the question of there being or not being appropriations at the time this beef was purchased is not considered, the price will still be a fair one, when we add to the market prices for beef the risks, and a proper per cent. for ordinary delays of payment. Take 4 cents as the value of good merchantable Texas cattle, such as those that were furnished, as the basis in the markets along the Pacific Railroad, and how does it figure out? If we add 50 per cent. for risks of delivery, the result is 6 cents. If to this be added 10 per cent. for delays in payment, we have about the price paid to Mr. Bosler. How much of that was net profit is not in evidence, but if we deduct from it what the witnesses all agree to be a fair estimate, to cover risks, &c., there is absolutely nothing left for profit. If the contract proved to be a profitable one, it was Mr. Bosler's good fortune that made it so, and no reasonable man ought to conclude, that because in this case he was lucky, that the Commissioner, therefore, made an improvident contract, when, according to all the probabilities which govern men in that country in making contracts of this character, it was only his good fortune and good luck which made it profitable, and not the probabilities themselves. If luck had been against, rather than in favor of Mr. Bosler, it is not difficult to see how he might have lost a large amount of money. There may be wise men, who, looking back over the transactions at this time, and knowing how Mr. Bosler came out in this contract, would say that he was paid too much; but I doubt whether any responsible man could have been found at that time who would have undertaken what Mr. Bosler did, under the circumstances, for a less sum.

I suppose, Mr. Chairman, that in connection with this matter of beef purchases, the contract of Mr. Morrow, made in September, for supplying these same agencies, upon advertisements and proposals, at 3.88 cents gross, will be offered in comparison, to show that 6½ cents was an extravagant price. Whatever effect that contract may have upon other questions involved in this investigation, it does seem to me that, in view of the testimony adduced, it cannot fairly be considered as furnishing any basis for the value of beef supplied by Mr. Bosler under the contract in June and August. We do not know what were the circumstances which led to the letting of that contract at that low figure. We do know that, if the testimony of witnesses is to be believed, it cannot be complied with except at great loss to the contractor. Mr. Bosler is himself interested in that contract, and he has testified (p. 63) that it cannot possibly be filled except at a loss of from $75,000 to $100,000. Mr. Morrow was subpœnaed to testify to the same effect, and it was admitted by the committee, that if present he would swear to that fact. The admission is as follows, (p. 108:)

"That there would be a loss to the contractor on the Morrow contract, with the most prudent management, of $75,000 or $100,000."

Everything in the testimony corroborates the truth of this statement. Beef cattle ready for delivery cannot be purchased in the beef markets in Kansas and Nebraska, for less than the price under this contract.

The whole amount to be delivered at 3.88 amounts to $277,032. If we add to that the loss at the lowest figure, $75,000, we have $352,032 as the actual cost of delivering the cattle at these agencies, or 4.93 gross, leaving nothing for profits. Can this contract, then, be any guide in ascertaining the value of beef cattle at the time the contract was made with the Commissioner which we have examined?

I suppose, Mr. Chairman, the case is to be decided upon the evidence in the record. We cannot, if we would, judge of this case fairly, upon any other rule; nor can we profit, in our judgment, by the experiences of the past year, and from an opinion which

must be set up as the infallible one, by which to test the judgment of Commissioner Parker in June, 1870. He acted upon the light he then had, and, I think the testimony shows, wisely; but if not, it would be unfair to censure him to-day, because, if he had the opportunity, he might again do better, or might have at the time done better, if he had known what he now knows. If public officers are to be held responsible for all the bad bargains which they may honestly make, and which, though prudently made at the time, are afterward found to be imprudent or bad bargains, who would escape censure, and who would be willing to undertake the responsibility of office if that were to be the rule by which he is to be governed?

PURCHASES OF FLOUR.

Another ground of complaint made against the Commissioner, is his purchase of flour without advertisement, and other articles, besides beef, by contract with J. W. Bosler, of June 17, 1870. I believe there is no evidence as to the prices of other articles, which need now be noticed besides the flour and beef, mentioned in that contract, and I am not aware that any one challenges the reasonableness of the prices, except as to those two articles. It is true Mr. Welsh makes some sweeping assertions as to bacon (with ribs) and sugar made of molasses, but the record is barren of evidence to support his charges. No evidence has been adduced to show that the Commissioner paid too much for coffee, sugar, and other articles mentioned in the contract, except as to beef and flour, and I suppose he may rest, in the absence of proof, upon the presumption that the prices were fair. The contract price for flour purchased at this time was six and one-half cents per pound, delivered at the various agencies reaching to Grand River. The supplies mentioned in this contract were to have been delivered between the 1st and the 15th of July, and were delivered promptly within that time. It will be remembered that these supplies were contracted for and delivered before any appropriation was made by Congress, out of which payment could be made. The contractor had but a few days in which to make his purchases and provide the means of delivery at the various agencies. The quantity required was considerable, and the means to which the contractor could resort were somewhat limited. Placing the flour at $3 50 at Sioux City, (the price subsequently paid by the Commissioner for an additional supply of flour at that point), and adding to it transportation and insurance, and considering the circumstances which we have mentioned, I do not think that any fair mind could attribute exorbitancy to the prices named in this contract. But the committee will remember that the objection to prices paid for flour was directed chiefly against the purchases made under anthority of the Commissioner's letter of August 10, to James W. Bosler; and while upon this subject of the price of flour, I may as well consider here the objection to that purchase of August 10. Laying out of view, then, all other questions except that of price, let us look at the evidence.

The amount furnished under this contract of August 10, was about 23,000 sacks, at $3 50 a sack. Of this amount, John H. Charles, a flour merchant of Sioux City, furnished 23,000 sacks, (see p. 72,) for which Mr. Bosler paid him $3 a sack, (see p. 72.) The Commissioner's idea in making the purchase in the way he did, was to avoid combinations and the appreciation of prices beyond a reasonable figure, and I think the testimony will show that he acted wisely in the premises. The amount of flour required was fully up to the capacity of that region of country to produce at that time. Indeed, before the millers and dealers were aware of the fact that a large quantity of flour would be required, they were bound up by articles of agreement to grind for Mr. Bosler's agents, (see deposition of Charles, p. 72,) and so complete was this arrangement, that some of the mills purchased back from Mr. Charles at a higher rate than they had charged, in order to supply their customers, (p. 72.)

The witness testifies as follows:

"Q. If it had been known at the time by you, and by the mills there generally, that 20,000 or 30,000 sacks would have been required, what effect would that have had upon the market?—A. If it had been understood that 25,000 sacks of flour were wanted, it would have raised the price of flour, and brought it very near to the rates for which it could be procured from Chicago, say $3 75 per 100 pounds. It would not have brought it up to that price exactly, but would have kept just inside of it, so as to prevent shipments of flour from Chicago.

"Q. Did the quiet way in which you made your purchases have any effect upon the market?—A. Yes, sir; taking out that much flour left the mills bare, and left the merchants bare. One of the merchants came to me and bought some flour, giving me twenty-five cents advance on the price which I paid to him on the same flour. He had his granary full of wheat at the time, but he could not get it ground, because the mills were working for me. The Chicago prices of wheat went up, and of course the city prices went up.

* * * * * * * *

"Q. If the Commissioner of Indian Affairs had advertised for 20,000 or 30,000 sacks of flour, to be delivered at Sioux City in August and September, 1870, what would have

been the effect on the flour market, and what would it have cost?—A. It would have cost me just inside the Chicago prices. For that quality of flour, it would have been in the neighborhood of $3 70 or $3 75. It would have cost that to bring it from Chicago, and we could have bought it just inside of that price. That is all that anybody would have done.

"Q. Why would it have had that effect?—A. Because very few people thereabouts could handle 25,000 sacks of flour, and they should have fixed their price at that point.

"Q. If you had known that Mr. Bosler wanted that amount of flour, could he have got it out of you at that price?—A. He could not. If I had not sold him the 5,000 sacks I had on hand, I would have got $3 50 for it, and in all probability a little over that." (Pp. 72, 73.)

There is an element, Mr. Chairman, entering into transactions with the Government which must not be overlooked, either here or elsewhere, in this investigation, and that is the difference between dealing with a private citizen of prompt payment, as Mr. Bosler is shown to have been, and dealing with the Government, where the customary delays in sending vouchers to Washington occurred. I invite your attention to the following questions and answers of this same witness:

"Q. What is the difference between selling to a man who pays promptly, and selling to the Government, where there is nothing but the customary delays in sending vouchers on to Washington and having accounts audited?—A. I would make twenty-five per cent. difference in favor of a man who would pay promptly, and whom, if he failed to pay, I could sue. I would want to charge the Indian Department twenty-five per cent. more than I would Mr. Bosler, or a man like him. * * *

"Q. What do you have to pay for the use of money up there?—A. From one to two per cent. a month. A low rate is one per cent. The usual bank rate is two per cent."

Now, if we take these two facts into consideration, it will be seen at once that the profit of fifty cents per sack, which Mr. Bosler derived, was not too large. Twenty-five per cent. of three dollars, the price which Mr. Bosler paid, is seventy-five cents, which added to the $3 would make $3 75 against $3 50 which the Government paid him. If we add the value of money to this computation, it will be seen that the difference is still greater. But, leaving those considerations out of view, still it will be admitted that the Government ought not to expect to make purchases from reliable men, and to look to them for prompt execution of contracts, without allowing some margin of profit. Men do not deal with each other upon any other theory, and it is a false notion to suppose that men deal with the Government upon any other. I read again from the testimony of this witness:

"Q. What would have been a fair margin or profit to warrant a prudent man in making a contract for 20,000 or 30,000 sacks of flour with the Indian Department at the time you have mentioned; do I understand you to fix it at twenty-five per cent?—A. That would be my rate; I should not want to do it for anything less. When we handle flour for merchants and people who pay promptly, our usual profit is twenty-five or thirty cents a sack. That is a fair wholesale profit; it is less than ten per cent."

According to the testimony of this witness—and we shall see he is fully corroborated by others familiar with the subject—Commissioner Parker, in the purchase of the 28,000 or 30,000 sacks of flour in August last, by the course he pursued instead of by advertisement, has saved to the Government not far from ten thousand dollars. I do not forget, Mr. Chairman, that upon the cross-examination of Mr. Burleigh, to whose testimony I will soon refer, you asked a question tending to show that the Government could have sent an agent to Sioux City for the purpose of purchasing this flour, and thus avoided the profits accruing to the middle-men or to Mr. Bosler. I do not know to what extent the questions and answers may have influenced the minds of the committee, and I beg, therefore, here to quote them, (p. 93:)

"By Mr. SARGENT:

"Q. If flour was to be bought here and there quietly, by the few hundred, say for two or three thousand sacks in amount, could the agent of the Government do that as well without employing a contractor?—A. I do not believe he could, for the very reason that the moment an agent of the Government goes out there, they mistrust something is up. If he went out there without being known at all, I have no doubt the flour could be picked up, but not that amount of it.

"Q. Is it necessary that the agent of the Government, going there for that purpose, should advertise it, either by his conduct or in any other way, so as to defeat his object?—A. I should not suppose it was. Still if a stranger should buy a large quantity of flour in that way, dealers would find it out very quick.

"Q. If a contractor finds it to his advantage to employ a resident commission merchant to make such purchases, paying a commission therefor, could not the Government act through those same means with advantage?—A. I see no reason why it could not if so disposed."

It is possible, Mr. Chairman, that if the Commissioner had turned his sole attention to this matter of purchasing flour, he might have devised a scheme by which to have

got the flour a trifle less. But, in applying to Mr. Bosler, he did no more than he would have done had he applied to a commission merchant. But I do not believe that any responsible commission merchant at Sioux City would have undertaken the purchase of this flour, in this quantity, taking the risks of combinations that might have been put up against him, at a less rate than Mr. Bosler. It is not possible in the nature of things for the Government to act in the matter of purchases of this character with the caution and business shrewdness of private individuals. The Government can only deal with responsible men on what seems to be a fair basis, leaving the contractor to make the best bargains he can, but always to make good his contract, no matter if it involves loss to him.

I have said that the testimony of Mr. Charles is corroborated by all who have spoken upon that subject; and while I feel compelled to avoid, as much as possible, lengthy quotations from testimony, yet so much has been said of this particular transaction, that I must be pardoned for calling your attention further to the testimony. Mr. Walter A. Burleigh, who has resided long in that country, and is familiar with the prices of flour and the flour market, gives the following testimony:

"Q. What would be the effect upon the flour market if an immediate demand was made, (and it was publicly known, by advertising or otherwise,) say for 20,000 or 30,000 sacks to be furnished at once?—A. The effect would be, in my judgment, to bring up the price of flour to the rate that you could get it from abroad, deducting the freight. When I took this contract of mine with General Clark, before going out myself, I sent out parties to purchase the flour, and they had to go to Cedar Rapids and buy it, in consequence of its being impossible to obtain that quantity nearer home. Besides, the capacity of the mills in that country is limited, so that a large quantity could not be furnished at once.

"Q. How was it in August, 1870; could this result have been avoided then?—A. It is one of the tricks of the trade out there, and I suppose everywhere else. They probably would have put up the prices, so that it would cost the same as if it was bought at a large market, with the freight out; I always found it so; and I have bought a great deal of flour for the Indians.

"Q. If you were then intending to purchase ten or twenty thousand sacks in that market, what course would you pursue if you wanted to get it cheapest?—A. I would buy it quietly, unless I expected to pay the Chicago or St. Louis price, less the freight," (pp. 90, 91.)

The witness meant, as his testimony elsewhere shows, that freight should be added, and this is what other witnesses say.

The witness Charles E. Hedges, who is familiar with trade in that vicinity, testifies as follows:

"Q. What effect upon the flour market would an immediate demand for 28,000 sacks have, if it were generally known—say in August last?—A. It would have the effect of immediately appreciating the market price.

"Q. Up to what point?—A. It is pretty difficult to determine.

"Q. Can you state what appreciation it would make in the price?—A. From fifty cents to a dollar a sack.

"Q. Why?—A. Everybody in the country would know that it would require nearly all the flour in the country to fill such a contract, and they would be satisfied that they could get their own prices, and would regulate their prices by what it would cost to ship it there from Chicago.

"Q. If you were going to purchase 28,000 sacks of flour in Sioux City at the best rates, would you advertise for it, or would you buy it quietly?—A. If I wanted to get it at good prices, I think I would go round and buy it quietly," (p. 67.)

A contract is in evidence between Superintendent Janney and Walter A. Burleigh, for the supply of flour at the Santee agency, one of the agencies lowest down the river. This flour was purchased at $3 35 per sack, (see testimony, p. 90.) He furnished about 2,600 sacks during the year. The witness (Burleigh) says:

"I bought a good deal of it in Yankton out of the wagons, and some at the nearest mills in Dakota, and the balance I bought in Nebraska, below the agency." (p. 90.)

I suppose it will hardly be urged that the difference of fifteen cents between this and the price paid to Mr. Bosler should influence the minds of the committee. The amount furnished by Mr. Burleigh was such as could have no effect upon the market, and could be bought in the neighborhood and at ordinary prices.

This, Mr. Chairman, is the testimony upon which you are to base your judgment as to the wisdom of Commissioner Parker's conduct in this transaction. We are not now discussing whether he ought to have advertised in order to have kept himself within the letter of the law, or that he ought to have called upon the board of commissioners to supervise the purchase and delivery, or that there was an exigency which governed the purchase; but we are simply to inquire whether the course taken by the Commissioner was a prudent one, and resulted in good or evil to the Government. The witnesses all concur in the opinion that the course pursued by the Commissioner was a

wise one, and I do not see how a candid mind can fail, in the light of the testimony, to come to any other conclusion.

TRANSPORTATION CONTRACT.

Among other subjects inquired into by the committee, as to which charges were preferred by Mr. Welsh, is the contract made by the Commissioner with the Northwest Transportation Company for the conveyance of the goods and supplies of the Indian Department for the latter months of the year 1870. It is alleged, first, that he ought to have availed himself of the transportation contracts in existence with the Quartermaster General's Department; secondly, that he paid too high a price for this transportation; thirdly, and I suppose it will also be urged that he ought to have consulted the board of commissioners with regard to this matter.

As to the first allegation I have to remark:

First. That the Commissioner of Indian Affairs had no knowledge of the existence of any contracts with the Quartermaster's Department for transportation of Indian goods and supplies. General Parker so testifies, (p. 24.) Quartermaster General Meigs, being recalled to explain his first deposition, also so testifies, (p. 96.)

Second. I do not see how the Commissioner can be held responsible for not availing himself of the bargains made by other departments of the Government, or that it should be expected of him to inquire of other departments of the Government as to whether they had existing contracts which could be resorted to for the benefit or the uses of his department. The Interior Department, and its bureaus, in the conduct of its affairs, is as distinct from the War Department and its bureaus as the Treasury Department and the Interior Department. If Commissioner Parker had known that the Quartermaster General was prepared to take his supplies, there might be some reason in calling upon him to answer why he did not do so. But in the absence of such knowledge, it seems to me as though it would fix upon him a responsibility that ought not to attach to him, for omitting to make inquiry upon this subject, any more than upon any other matter of administration in his office. The Indian Department has always made its own contracts, both as to supplies and transportation, except in special cases where supplies were to be furnished from the Commissary Department, in which case the War Department, through the Quartermaster General's Bureau, usually delivered the supplies. But always when purchases have been made by the Indian Bureau, or the Interior Department, for Indians, provision has been made for their delivery by this department. General Meigs explains that the clause in the quartermasters' contracts for transportation covering Indian goods was put in as a matter of routine, and grew out of an arrangement in 1869, by which the Commissary Department had furnished supplies to the Indians, and, in doing so, had availed itself of the Quartermaster General's contract.

Third. Even if the Commissioner had desired to avail himself of the quartermaster's contract, it does not follow, by any means, that he could have done so. He had a large amount of freight to be sent up the Missouri River, including the necessary supplies to the Indians, and the annuity goods. It was not known precisely when they could be ready for shipment to Sioux City. With the Commissioner it was a matter of greatest moment that there should be no failure in their delivery, sooner or later, and, as the responsible head of his Bureau, he was compelled to be satisfied in his own mind as to the best means for their delivery. He had talked with men engaged in transportation, and had got their ideas with regard to prices. I quote from his testimony, (p. 30:)

"Q. Explain with regard to the question of transportation. The contract was dated September 26, yet some of the goods were forwarded, agreeably to your understanding, prior to that time. Did you complete, so far as you regarded it, the contract of Mr. Woolworth prior to his receiving any goods for transportation?—A. We had a full talk, prior to his receiving any goods at all, as to all matters connected with the transportation of Indian goods. He gave me a general idea of what they would do it for, with the exception, it may be, of one or two points high up the river. They did not want to take the Berthold goods, which they subsequently did take. He said they would not go up with a boat with less than 150 or 200 tons, or something of that kind. There were two or three minor points like these, which had not been settled when he went West, but I said to him that there must be no delay in forwarding the goods; that when they reached Sioux City, if there is a boat there, they must be forwarded at once, and for him to execute the contract as soon as he could, and send it back to me, and I would execute it on my part.

"Q. Did you inform yourself with regard to the responsibility of this transportation company to carry out a contract of that kind?—A. I did inform myself as far as I could, and satisfied myself, in my own mind, that they were the only parties on that river that could do the transportation I wanted without being subjected to inconvenient delays."

The annuity goods were late in being shipped from New York, and in their arrival at Sioux City, although every effort was made to hurry them forward. Large pur-

chases of flour were made in August, also to be transported, and a large quantity of bacon had been purchased under contract of September 26, at Chicago, which also had to go forward for shipment up the river, making it more than probable that shipments would extend into the month of November, and possibly December; and hence the contract was made to cover both of those months. The vouchers from the Second Auditor, (in evidence,) for the payment of transportation, show the dates of shipment, and from these it will be seen that while considerable freight went forward in September, by far the largest portion of it was late in October, and a large quantity in November. Now, the quartermaster's contract for freights from St. Louis expired the 31st of October, and ten days' notice at Sioux City was required in order to bind the contractor to take the goods, which would reduce the time of delivery to the 21st of October. Furthermore, General Myers, a quartermaster of long experience in the Department, and familiar with the manner in which this contract was made, testifies as follows:

"Q. State, if you know, whether there is an understanding between the contractors and Quartermaster's Department in bidding for these rates, that the bulk of the goods are to be sent up early in the spring, on the spring rise.—A. The rule with regard to the transportation of supplies by the Missouri River, is to advertise early in the spring, ascertaining beforehand the exact amount, as nearly as possible, which will be required at the different posts. The quartermasters usually inform those interested in bidding of the amount intended to reach each particular post, and the bids are made upon the presumption that the bulk of supplies will be shipped at the most favorable period of navigation of the Missouri River, which is the spring rise, commencing in May, and extending through the month of June and a part of July. And all the officers of the Government usually make it a point to have their supplies ready for that condition of the river, in order to get the supplies to their posts, and also to secure more favorable rates for freights. As a matter of fact, that theory is carried out, or at least has been carried out, to my certain knowledge, during the last ten years in which I have assisted in supplying these posts.

* * * * * * *

"Q. The object, then, of providing for later freights was to cover any contingencies of smaller lots to be sent up, which could not be provided for earlier in the season?—A. Yes, sir."

I do not say that, as this understanding is not embodied in the contract, that it would be binding. Yet it might have been a ground of objection on the part of the contractor, which would have led to delays in the shipping of the goods, leaving the Government only to its remedy upon the bond. But in a case like the present one, such a remedy could not be made adequate to the loss in not supplying the Indians promptly. Again, the quantity of supplies to be shipped under the quartermaster's contract, was limited; and although it appears that the limit was not reached by the Department, it was not at all certain at the time the Commissioner made his contract, that the War Department, through some emergency, or otherwise, might not have required the full amount of transportation provided for in the contract. However, I do not desire to pursue this point, for it would only be important in case Commissioner Parker had known the contract existed, and that he could have availed himself of it, which knowledge he did not possess.

As to the other contract with the Quartermaster's Department for transportation from Chicago, it provided for through freights from Chicago. It expired October 31, 1870, and could have been used by General Parker only for the transportation of bacon, which was purchased at Chicago. But of this contract he had no knowledge, and it ought not to be considered in judging of his conduct, except by way of comparison as to the rates provided for, when we come to examine the question of prices paid by the Commissioner under his contract, and this comparison will not be unfavorable to the Commissioner.

We come now to notice the second point stated with regard to transportation, viz: that Commissioner Parker paid too high prices for his transportation. One means of establishing this charge, and I may say the only one resorted to by the prosecution, has been the introduction of the quartermaster's contract heretofore alluded to; and the contract of freights up the Missouri River from St. Louis has been the one chiefly relied upon, and I suppose I may safely leave the other out of view. That contract provided for what are known as summer rates, that is to say, up to and including August. But as none of these goods and supplies were shipped during these months, the rates are therefore out of the question. According to the terms of the contract, the September rates were one hundred per cent. above those of the other months, and the October rates two hundred per cent. in advance of the summer months. I do not think that any fair comparison can be made between the quartermaster's contract and that of Commissioner Parker. There were certain advantages of great profit to the contractor in the quartermaster's contract, that were not in Commissioner Parker's contract at all. Some of these I will mention by way of illustration. It provided for the transportation of officers and soldiers. For example, from Sioux City to Yankton agency, the con-

tractor got $10 for each officer, furnishing him cabin room, but not subsistence; to Fort Randall, just above Yankton agency, $20; Whetstone agency, $26; Lower Brulé agency, $32; Crow Creek agency, $42; Fort Sully, (just above Crow Creek agency,) $48; Cheyenne agency, $52; Grand River agency, $56; Fort Stevenson, $86; Berthold, (the highest point of shipment by Commissioner Parker,) $100.

For soldiers, who were furnished room upon the decks without subsistence: From Sioux City to Yankton, $6; Fort Randall, $8; Whetstone agency, $10; Lower Brulé, $12; Crow Creek agency, $14; Fort Sully, $16; Cheyenne, $18; Grand River, $20; Fort Rice, $22; Stevenson, $26; Berthold, $32.

This contract also provided for horses, mules, and cattle. For carrying a horse, mule, or ox from Sioux City to Yankton, the contract pays $16; to Fort Randall, $28; to Whetstone, $40; Lower Brulé, $56; Crow Creek, $58; Fort Sully, $62; Cheyenne, $68; Grand River, $74; Berthold, (the highest point shipped to by General Parker,) $110.

Wagons and ambulances were provided for at equally high rates. This contract also provided for way freights between the various points from St. Louis to the highest point, and some of the rates paid I will state, to illustrate the advantages of this contract:

Rates paid, per hundred pounds, for transportation of way freight, under Hiram K. Hazlett's contract with the Quartermaster General, computed from contract for March 20 to October 31, 1870.

	March to July inclusive.	September.	October.	Table of distances.
				Miles.
Sioux City to Yankton agency	$0 75	$1 50	$2 25	142
Yankton to Randall	75	1 50	2 25	104
Randall to Whetstone	95	1 90	2 85	25
Whetstone to Brulé	1 00	2 10	3 00	120
Brulé to Crow Creek	1 00	2 20	3 00	11
Crow Creek to Fort Sully	1 15	2 20	3 45	79
Fort Sully to Cheyenne	1 15	2 30	3 45	65
Cheyenne to Grand River	1 10	2 20	3 30	115
Grand River to Fort Rice	1 15	2 30	3 45	110
Fort Rice to Stevenson	1 30	2 60	3 90	164
Stevenson to Buford	1 50	3 00	4 50	455

Table of distances from Sioux City to—	River distances.
	Miles.
Yankton agency	142

Fort Sully agency	482
Cheyenne agency	541
Grand River	661
Fort Rice	776
Fort Stevenson	935
Fort Berthold	946
Fort Buford	1,201

I have been quoting from the September rates. The October rates are one hundred per cent. above the September rates, which will still further assist in showing the advantages of the quartermaster's contract to the contractor. The secretary of the Northwest Transportation Company, Mr. Woolworth, explains the advantage of this kind of freight, irrespective of the largely disproportionate prices paid for it. The tabular statement which I have just quoted was shown to the witness, and is appended to his testimony, from which I quote, (p. 83:)

"Q. Am I to understand from this tabular statement that the rates shown for way freights are the amount paid for the distances as shown in the same table?—A. Yes, sir.

"Q. Was or not this part of the contract favorable or otherwise to the contractor?—A. The way freights, so far as my knowledge has been, are always taken into account in making up the other rate to the principal points; that the way freights are much

larger, and go to make up a better rate on the other freight; that it is an advantage on a contract. Soldiers are a very large advantage on a contract.

"Q. What is the advantage of having soldiers, and cattle, and things movable?—A. The advantage in having soldiers is that you can load a boat with about all the freight you want to put on her, putting the freight in the hold, and then putting two hundred troops aboard of her is no disadvantage at all. If you run on a bar the soldiers can get off and walk around, and they are of great assistance on the boat if they are under discipline; and the receipts from the transportation of soldiers are always large.

"Q. In making bids for transportation with the Quartermaster's Department, have you heretofore had reference to representations made by Government officers that the bulk of freights would go up in the early months?—A. We did this year—for 1870.

"Q. In 1870 that was taken into consideration?—A. Yes, sir. We lost before for that reason, and before we bid on these contracts we had an interview with General Rucker, and were assured that this year he would not burden us in that way; that the freight should be hurried off, and come in under those contracts, on the early months.

"Q. How does that affect your rates, as shown in this Hazlett contract, for the late months; are they as high as they would be otherwise?—A. The estimate on that contract is made by adding the rates of each month together and dividing it by the number of months for which it is bid for, taking the average. When we bid, we were assured there would be little or no October freights; hence we did not put the rates high, because we were afraid of raising the average on account of competition.

"Q. What am I to understand from you, in regard to those October freights, with reference to their being put at a higher price?—A. I would say that a man bidding on that contract, understanding the business, if he had no assurance that he would have little or no October freights, he would make it higher.

"Q. If he had a large bulk in October, what would be the result?—A. In ordinary seasons he would lose a good deal of money. We had as good a rate as that before; but last year I do not think any money would have been lost under that contract, perhaps—that is, 1870."

I quote also from this same witness' testimony, (p. 82:)

"Q. Was the quartermaster's contract with Hiram K. Hazlett more advantageous to the contractors than the one made by Commissioner Parker with you?—A. I consider it so.

"Q. Why?—A. Under the quartermaster's contract large rates—full rates—were paid for way freight. There were soldiers, and the transportation of wagons, horses, and mules, and they would pay a much larger rate than common freight; and there were very often down-stream freights, by which the boats could double their receipts. The freight under that contract—the bulk of it—was shipped during the best months of navigation.

"Q, How was it with Commissioner Parker's contract in that respect?—A. The freight under that contract was shipped late in the fall.

"Q. And was liable to go to what month?—A. The expiration of the contract was the 1st of January. There were no down-stream freights under that contract; nothing but up-stream freights; no way freights included; nothing but up-stream freights."

I have already called attention to the fact, as shown in evidence, that contractors in bidding for the quartermaster's contract, expected the large bulk of supplies to go up at the earlier rates in the earlier months. And Mr. Woolworth explains that the rates for the later months of September and October were made lower than they ought to be, to reduce the average on the whole, by which the lowest bidder is finally determined. And all the witnesses concur in stating that there is more profit in freights at the lower rates taken in the early months, than at the higher rates taken in the later months. (See the testimony of General Myers, Mr. Charles, Mr. Hedges, and Mr. Burleigh.)

All the witnesses concur, and General Myers, who has had long experience in contracting for transportation up that river, states it distinctly that a contract made early in the season embracing summer and fall freights, where it is understood that the bulk of the freights are to go up in the early months, can be made more favorable in its terms for transportation during the late months, for whatever may be then required to be made late in the year, for the late freights. All these things considered, it would seem to me unfair to make the Quartermaster General's contract an unfailing guide in determining whether Commissioner Parker's contract was fair or otherwise—made late in the season, and under totally different circumstances, and embracing only pound-freights, with no down freights, no way freights, no large prices for movable articles, and at a time when, in all human probability, a large amount would have to be shipped by wagons. I find upon actual computation, that of the freights shipped by Commissioner Parker under this contract with the Northwestern Transportation Company, there was taken to the various agencies in the month of September, after the 24th day, a trifle over one million pounds. If we are to be governed by the Quartermaster General's rates for that month, Commissioner Parker paid too high. But this we have seen is not a fair standard, and ought not to govern in the case. On computation for the month of October, I find there were a little over two million and a half pounds shipped, the greater

part of it after the middle of the month, and a very large portion of it delivered at the agencies on the last days of the month; and, in the month of November, during which there were no rates provided for by the Quartermaster General's contract, there were delivered about half a million pounds of freight, and the most of this after the middle of November.

Now let us look, as briefly as we can, at the testimony in regard to the navigation above Sioux City at that season of the year. In the first place, the witnesses concur in stating that it would not be safe to send freight by water to a point higher than Whetstone agency (which is about 270 miles from Sioux City) after the 10th or 15th of October. Upon this point I refer to the testimony of Mr. Woolworth, Mr. Charles, Mr. Hedges, Mr. Burleigh, and General Myers.

It will be seen, then, that although the quartermaster's contract provided for freights during the month of October, it never could have been contemplated that they were to be sent at that late season of the year, for no such terms could have been secured in the contract. Upon this point General Myers is clear in his testimony.

There is much testimony in the record explaining the perils of navigation at that season of the year. I do not feel warranted in quoting it at length here. I think I can state, briefly, enough of this to remind the committee of the testimony in the case; and if any doubt exists as to my accuracy, I refer to the testimony of the witnesses just named. It is shown that the water is always low at that season of the year, and that there are high winds prevailing, which are unknown in the early months of the year. This alone, as witnesses have stated, often delays boats many days. There is danger of ice after the middle of October. A boat caught in the upper river by ice seldom escapes. Insurance is 25 per cent. upon hulls, and late in the season cannot be obtained at any rates. It is also shown that last year was an unusual one, and that this stroke of fortune was all that saved the transportation company from loss under their contract. I suppose that such a thing as the delivery of freights by water at Fort Berthold, in the latter part of November, and the return of the vessel safely, has not occurred upon that river before last year within the memory of man. To show something of the peril of navigation during the carriage of this freight, I read from the deposition of Mr. Woolworth, (p. 84:)

"Q. Did you lose a boat during the execution of the Parker contract?—A. Yes, sir.

"Q. What was her value?—A. She was valued at $10,000, but cost more.

"Q. How did you deliver what freight you saved?—A. We sent another boat to her. The crew saved about half her cargo; saved her deck cargo, put it ashore, and we sent up another boat which delivered it.

"Q. At what cost?—A. It cost us $1,000, I should estimate, over the receipts."

I must ask the pardon of the committee for quoting again from the testimony of this witness, (pp. 83, 84.):

"Q. Did you make a contract in 1869?—A. Yes, sir; with Captain James Gillis, quartermaster at Sioux City. We made that contract in September—I think about the middle of September—to Fort Buford. We got 8 cents for that.

"Q. Where is Fort Buford?—A. It is above Berthold—250 miles above.

"Q. Did you carry any private freights at that time?—A. Yes, sir.

"Q. What freights did you get?—A. Ten cents.

"Q. Was that contract let upon proposals?—A. It was.

"Q. Do you remember any instances of starting boats as late as in August, 1869?—A. Yes, sir; we started two boats to Fort Benton in August.

"Q. How loaded?—A. Loaded light with Government freight, under a contract we had with the Quartermaster General.

"Q. How far did those boats go up?—A. To the mouth of Milk River.

"Q. Where is that?—A. I think about 400 miles above Fort Buford.

"Q. What time did they reach there?—A. About the 1st of September.

"Q. What was the result of that trip?—A. The water was so low that the boats could not go any further than the mouth of Milk River. There they put their freight ashore, and the captain divided the crews, and left part of them there with the freight, and sent the boats home.

"Q. How were they at last delivered?—A. The captain sent a messenger to Fort Benton and got an ox train of a hundred wagons, and hauled the freight up to the fort from there.

"Q. What was the result of that operation financially?—A. The company lost $20,000 on the two trips."

Now, Mr. Chairman, I desire to call your attention to Exhibit B, (pp. 87, 88,) attached to the deposition of this witness. I prepared it during the course of the trial for the purpose of illustrating the comparative prices paid by Commissioner Parker under his contract last year, and for the purpose, also, of comparison with the contract made in 1868 by the then Commissioner of Indian Affairs, and the contract made in 1869 by Commissioner Parker. I have taken from the quartermaster's contracts in this exhibit the rates of freight for the month of October. I think it is not too much to say that the difference between the September and October rates provided for in the quarter-

master's contract, and the rates in Commissioner Parker's contract, are more than balanced by the difference in the character of the contracts, and the circumstances under which they were made. And yet it will be seen that the rates paid by Commissioner Parker were but little in excess of those paid in October by the Quartermaster General, and that a large amount of the Indian freights were sent forward late in the month of November, during which no provision was made in the quartermaster's contract, and during which time, as General Myers told you, it would have been almost impossible to have made a contract at any price. The tabular statement is as follows:

EXHIBIT B.

October freights, per hundred pounds, under Hiram K. Hazlett's contract with the Quartermaster General, computed from contract for March 20 to October 31, 1870, inclusive.

Sioux City to Yankton agency	$2 25
Fort Randall	2 25
Whetstone agency	3 00
Lower Brulé agency	3 30
Crow Creek agency	3 75
Fort Sully	3 90
Cheyenne agency	4 80
Grand River agency	4 80
Fort Stevenson	6 00
Fort Buford	6 75

Fort Berthold is between Stevenson and Buford. Quartermaster General's contract had no rate to Fort Berthold. The rate would be governed by rate to next point above Berthold, which would be Buford.

Rate of freights, per hundred pounds, under contract of Northwestern Transportation Company with Commissioner Parker, dated September 26, 1870, for September, October, November, and December, 1870.

Sioux City to Yankton agency	$2 25
Whetstone agency	3 25
Lower Brulé agency	4 25
Crow Creek agency	4 25
Cheyenne agency	5 25
Grand River agency	6 25
Fort Berthold	7 50

Transportation contract of March 25, 1868, from April 1 to October 1, 1868, between Northwestern Transportation Company and N. G. Taylor, Commissioner of Indian Affairs; rates per hundred pounds.

New York City to Yankton agency	$7 72
Whetstone agency	7 72
Brulé agency	7 72
Crow Creek agency	7 72
Cheyenne agency	8 72
Grand River agency	8 72
Berthold agency	10 72

The average railroad rates from New York to Sioux City were $2 60 per hundred pounds, which, deducted from this table, shows as below:

Sioux City to Yankton agency	$5 12
Whetstone agency	5 12
Brulé agency	5 12
Crow Creek agency	5 12
Cheyenne agency	6 12
Grand River agency	6 12
Berthold agency	8 12

Yankton, Whetstone, Brulé, and Crow Creek agencies are between Sioux City and Fort Sully; Cheyenne and Grand River are between Forts Sully and Rice; Berthold is between Fort Union and Muscleshell.

Commissioner Parker's contract of May 13, 1869, is at same rates as contract of Commissioner Taylor for 1868.

Rates paid under contract with same company, September 28, 1870, for September, October, November, and December, 1870.

Sioux City to Yankton agency	$2 25
Whetstone agency	3 25
Lower Brulé agency	4 25
Crow Creek agency	4 25
Cheyenne agency	5 25
Grand River agency	6 25
Berthold agency	7 50

I think that any one examining this table, and keeping in mind the facts to which I have called attention, will not discover any improvidence or wastefulness of public funds in the matter of Commissioner Parker's contract of last year.

It is not in evidence whether the Northwest Transportation Company derived any profit from their contract, nor does it appear that they suffered a loss. That company is not on trial here, nor is it important whether they made or lost money. But I feel authorized to say, in connection with the developments with regard to the transportation of the Indian goods and supplies, that I do not believe anything short of the most commendable enterprise could have ever accomplished what this company did in the delivery of those goods. And I do not believe that Mr. Welsh, or any other man, could have made provision for the delivery of such an amount of freight as Commissioner Parker was called upon to deliver at that late season, upon better terms, or could have more successfully executed the work. I know that it was a matter of congratulation among all who were interested in the delivery of the goods, that it had been so successfully accomplished; and I know that the transportation company were accorded no little credit among shippers and merchants for accomplishing what seemed an impossibility at the time.

But that is of no consequence. You are to say whether the bargain Commissioner Parker made was a fair one under the circumstances. You are not to split hairs in looking back over this matter, to say whether here and there a dollar, or a thousand dollars, may have been saved. But you are to say whether, in view of all the facts, you, yourselves, in the honest discharge of the duty then devolving upon the Commissioner, and with the information he then possessed, would have done as he did, and in making this inquiry, I feel quite sure you will discover no wastefulness or improvidence.

A third point was suggested in opening this question of transportation, which was, as to the duty of the Commissioner, to consult the board of commissioners in relation to the making of this contract. I have not treated that question in any of the subdivisions of this summing up, but have reserved it for a separate examination. It is admitted by Commissioner Parker that he did not consult the board with reference to the making of the contract of June, 1870, or its extension in August, nor was the board called upon to inspect the articles delivered under those contracts, nor was it consulted in the making of the transportation contract just noticed, nor to inspect the bacon purchased at Chicago on advertisement, nor in the making of the purchases of presents for the Osage Indians. I will address myself to that branch of the case shortly. As the same reasons apply in all these instances, it will hardly be necessary to examine each separately, although some remarks may be made in passing with reference to each.

CIRCUMSTANCES CONNECTED WITH LETTING THE CONTRACTS.

I propose now, Mr. Chairman, to group together as fully as possible, the various circumstances connected with the letting of the contract of June 17 to Mr. Bosler, and the extension of the contract of August 10, as to beef and flour, and the making of the transportation contract of September following, with the view of looking at the worst features of the case, as they affect the conduct of Commissioner Parker.

I have given somewhat fully, though not all, the evidence, which showed the presence of an exigency which had to be met in some way in June last. I think I need not again refer to the testimony bearing upon that point. Assuming, then, that the exigency will be admitted, let us see how far he honestly and fairly met it.

Commissioner Parker has told you in his testimony, that he consulted the Secretary of the Interior fully and freely. As the two contracts of June and August were made under what the Commissioner regarded similar circumstances, and to provide for a similar state of things, it will be as well, perhaps, to treat of the two together in this connection. On page 29 I read as follows:

THE BOSLER CONTRACTS.

"Q. Had you any previous acquaintance with Bosler prior to the contract made in June, 1870?—A. I may say that I hardly had any at all. I had seen him two or three times before this contract was entered into, or perhaps three or four times altogether.

"Q. Had you any information as to his responsibility or reliability for complying

with any contract he might undertake?—A. I did inquire as to his responsibility from parties who I supposed would know respecting his capacity to execute or fill any contract he might enter into, and my information was that he was a good contractor, perfectly responsible and reliable.*

"Q. About the extension of the 10th of August, what, in your mind, was the controlling reason for making this extension, what were the necessities at that time which required it?—A. The main reason I had in my mind was simply to prevent the agencies from running short of supplies for the Indians on the Missouri River. I looked at it in this way: The beef supply, under the arrangement of June 17, was becoming exhausted, and before I could advertise, contract, and get beef under the contract, the agencies would probably be entirely out of supplies, and the Indians would have left the agencies, which I wished to avoid if possible. That was my reason for ordering the extension.

* * * * * *

"Q. Was your conduct in the matter, or not, based upon your best judgment, as an officer of the Government in charge of the Bureau of Indian Affairs?—A. It was based upon my best judgment. I thought, at the time, I was doing the best I could under the circumstances surrounding the case.

"Q. Had you any reason to favor Bosler in any particular?—A. None at all.

"Q. Did you ever favor him purposely?—A. No, sir.

"Q. The contracts spoken of were made with a view to the best interests of the service, as far as you could judge, at that time?—A. That was my idea.

* * * * * *

"Q. In regard to advertising for bacon and beef, in August, did you purposely defer that advertisement in order to give Bosler an extension of his June 17 contract?—A. No, sir; it never entered my mind.

"Q. Had you any correspondence with Bosler in regard to the June 17 contract whatever, in which you gave him to understand that you intended to give him an extension?—A. No, sir; I had no communication whatever with him to that import.

"Q. State whether or not the first knowledge he had of your intention to give him an extension was your letter of August 10.—A. I suppose that was ths first intimation he had. I did not indicate to any one my intention to do anything of the kind. I found that it became absolutely necessary to extend his contract, or make a new one with somebody else, instead of waiting for a contract under an advertisement."

The witness then explains the circumstances attending the advertisements, after which the following question and answer are found, which I read:

"Q. Then, to meet an emergency, your office has never regarded it safe to wait for contracts by advertisement?—A. We could not do it very well. When an emergency occurs, we must take all the precaution we can to inquire into the responsibility and ability of the party to execute what he proposes to do, see that the price named is a reasonable one, and make the best contract we can."

WHY ADVERTISEMENTS WERE NOT PUBLISHED.

I think it not improbable, Mr. Chairman, that you will attach importance to the fact that advertisements were not published immediately after the passage of the appropriation bill, thus avoiding the extension of Mr. Bosler's contract, which took place August 10. And it may, perhaps, not be easy for the committee to perceive why this advertisement was deferred. But it will take a great deal of testimony and many suspicious circumstances to convince any one who knows Commissioner Parker, that he purposely deferred publishing that advertisement in order to give Mr. Bosler the benefit of an extension of his contract of June; especially is this so, when the Commissioner testifies so directly and ingenuously upon the subject. To one who will reflect upon the multifarious duties of his office, it will readily appear, after reading the testimony, that he might very naturally overlook this matter in the press of other and equally important business, and during his necessary absence in New York, making the purchases of annuity goods.

With regard to this matter, ex-Secretary Cox testifies, page 77:

"Do you know of any reason why the advertisement could not have been inserted a week or fortnight earlier?—A. None, except that the general was in New York, busy with the purchases there, and having a good deal on his hands. I could see how, in the rush of work after the appropriation bill was passed, he might leave other matter unattended to for a time.

* * * * * * * *

"Q. Was anybody left here to attend to the business of the Department?—A. Of course. The chief clerk is, by law, the acting Commissioner in the absence of the head of the Bureau, just as Judge Otto is Secretary in the absence of the Secretary.—Q. Was there anything to prevent his inserting it a week earlier?—A. Nothing that I

---

*Several witnesses, among them General Myers, testified to Mr. Bosler's uprightness of character and reliability as a business man.

know of, except that he seemed to hesitate to take the responsibility, and that was the case during the whole of Commissioner Parker's absence. I think it might be said that Mr. Cady was hesitating to take the responsibility, and consequently the general was attempting to do, by telegraph from New York, pretty much all the work." (P. 78.)

Upon this question of advertising, the Commissioner testifies, (page 31:)

"Q. Do you remember when your attention was first drawn to the matter of advertising for beef and bacon?—A. No, sir. I suppose it had been on my mind at different times after the passage of the appropriation bill as well as before, but I could not get to work preparing the thing until probably a week before the 26th. I was in New York, and the matter was overlooked in the office.

"Q. I find here in the correspondence, printed, a letter of Mr. Cady, acting Commissioner, to the Secretary of the Interior, dated August 13, stating that the office was about to advertise for proposals for subsisting the Indians. Do you remember whether you were here in Washington, yourself, previous to that?—A. I was in New York. I came here on the night of August 9, and was here the 10th and 11th. I think I left for New York the night of the 11th.

"Q. And while you were here in town you extended the Bosler contract?—A. Yes, sir; and at the same time I probably suggested to Mr. Cady that the preliminary steps be taken toward advertising, under the law, for beef and bacon, providing it had not been done. I have no recollection of that, but that is what I naturally would have done. I have no memorandum on the subject.

"Q. In your administration of the office, have you, or not, had frequent consultations with your superior officer, the Secretary of the Interior?—A. I had daily conference with him upon every subject relating to Indian affairs.

"Q. State whether there was any concealment, upon your part, about what you were doing in regard to supplying these Indians, or whether the Secretary was informed upon the subject?—A. There was no concealment upon my part. My communications were open and free with the Secretary. I wish to say here, as a matter of explanation, that a great deal of the business of the Indian Office, and of the administration of the office, is carried on by verbal conversation with the Secretary of the Interior, of which no memorandum or record is kept. As a matter of course, they result in an order or instructions or directions in writing from the Indian Office, and nothing appears on record showing the consultations taken between the Secretary and the Commissioner on the subject.

"Q. That is, you take your portfolio and talk with the Secretary verbally about it?—A. Yes, sir.

"Q. Explain whether you talked with him in regard to supplying the Indians as provided for in this contract of June 17?—A. I had frequently talks with him in reference to entering into this contract of June 17. He was aware of the whole of it.

"Do you remember whether you consulted with him when you came over from New York?—A. He telegraphed me to come over August 9, the day before the extension.

"Q. Do you remember whether you talked over matters relating to the supplies of Indians at that time?—A. I do not recollect particularly whether we did or not. I know I was in the habit of mentioning all these things, which I considered necessary to be done.

"Q. Had you any reason to conceal from him any facts in relation to it?—A. None at all."

On page 33:

"Q. You say you followed the custom of the office in regard to purchasing in open market; has or not that been the uniform custom of the Indian Bureau, extending back for many years, to your knowledge?—A. So far as my information goes, they have always done that every season.

"Q. Have you, in any particular, departed from the custom and usages of the office in executing the law?—A. I simply followed the custom of the Department in every respect. There are a good many things it is impossible for us to advertise, and which we must purchase in open market, or we cannot get along in the administration of the Indian affairs."

And again:

By Mr. SARGENT:

"Q. Can you give any reason why an advertisement for beef could not have been made on the 15th of July last, to be awarded within ten days or two weeks, or any later time before the 10th of August, when this contract was extended?—A. As I have said, I was personally very much occupied after the passage of that bill in getting the many appropriations provided for into shape for the purpose of making them available. Aside from that, my whole attention was directed to the purchase of the goods. These Indian delegations had been here urging us to furnish them with goods, and subsistence had to be supplied temporarily without waiting for advertisement.

"Q. The subsistence was to be provided for September; what prevented contracts

under advertisement for these goods before that time?—A. Nothing, except that I was in New York nearly all the time engaged in buying annuity goods.

"Q. Were you gone three months?—A. Nearly two months.

"Q. Was any one acting as Commissioner?—A. Mr. Cady was acting as Commissioner.

"Q. Was there anything to prevent his advertising?—A. No, sir.

"Q. Then I understand you to admit that you neglected your duty in not advertising yourself, or giving him orders to advertise?—A. I did not give him orders for the reason that my attention was entirely engaged in New York, as I have stated."

With regard to the statement of the Commissionor, that the Secretary knew all about the contracts being made, the Commissioner adds to his answer, page 109:

"I do not want to say on the record that he was aware of the whole of it, but that he was aware generally of the transactions which resulted in the contract."

WAS THE CHAIRMAN CONSULTED?

The chairman will remember that this question of consultation with the Secretary was deemed of such importance by the Commissioner that he was unwilling to rest it upon his own sworn statement, and he insisted upon the Ex-Secretary's being called, although it was urged upon him as involving General Cox in great personal inconvenience.

I think if anything were wanting in this case to show the faith the Commissioner felt in the uprightness of his own conduct, and the belief that the Ex-Secretary would corroborate him in this important matter, it is to be found in this circumstance, that his personal presence was insisted upon by the Commissioner. That faith was further tested in putting him upon the witness stand without previous consultation or knowledge as to what he would testify to. I shall not now dwell upon the disappointment the Commissioner felt upon reading the deposition of his late chief, and finding that he denied all knowledge of the contract made with Mr. Bosler. The Ex-Secretary says, page 76:

"My impression is that somewhere about that time General Parker stated, as a fact, that he was obliged, as Indian Commissioner, to make some temporary arrangements to get some supplies between the termination of the arrangement with the Commissary Department and his issuing of his advertisements. But there was never any consultation with regard to contracts further than such general statement as that."

But the following question was put directly to the Ex-Secretary, and his answer is very distinct and very emphatic, and, as I have said, was very disappointing to the Commissioner, for it seemed to raise a question of veracity between the head of the Department and the head of the Indian Bureau. I read the question and answer:

"Q. Were you consulted with reference to a contract made on the 17th of June, 1870, prior to the passage of the appropriation bill, made with James W. Bosler for the supply of a large amount of beef, bacon, salt pork, flour, coffee, sugar, salt, soap, and tobacco, to be delivered on the Missouri River; a contract made without advertisement or competition?—A. In reference to any contract with Mr. Bosler, I can say I never heard of or saw the name of Bosler until this investigation commenced, and consequently I was not consulted in regard to any contract with him."

It would have been unfortunate, indeed, had this very important subject remained in this attitude. It would have cast a suspicion over the whole of the Commissioner's testimony, and inevitably left the impression that he had purposely concealed from his chief the making of this contract with Mr. Bosler, and that would have thrown a cloud over the whole case. Those who know the Commissioner well would have believed the Secretary mistaken; but others would have believed the Commissioner mistaken.

But, Mr. Chairman, happily for the truth, at the very last moment, a link in the chain of testimony was discovered, and is in evidence, which relieves this question of all embarrassment, and fully corroborates the Commissioner. Not only that, Mr. Chairman, but it tends strongly to establish the truth generally of the statements made by the Commissioner in regard to his conduct in this matter. The fact is, he was the moving spirit from first to last, and it is not improbable, therefore, that he would remember more accurately the facts than would his chief. It is only to be regretted that his chief did not speak more guardedly in relation to a matter about which he was fixing the gravest responsibility upon an important officer of the Government. I have read from General Cox's testimony. It will be seen that he declares that he never saw or heard of the name of Bosler, or any contract with Bosler, until this investigation commenced, and, consequently, was not consulted in regard to any contract with him. And he repeats this statement on page 78, that he had no knowledge of the contract with Mr. Bosler, and never heard of Bosler's name. The whole spirit of his testimony seems to cast blame upon the Commissioner in this regard.

Let us, then, Mr. Chairman, see how the truth confronts error. I read from the correspondence to be found on page 159:

"DEPARTMENT OF THE INTERIOR,
"OFFICE INDIAN AFFAIRS,
"*Washington, D. C., June* 18, 1870.

"SIR: I have the honor to state that arrangements have been made by this Bureau with James W. Bosler, esq., for the delivery of certain subsistence supplies for the use of the Indians on the Yankton, Whetstone, Cheyenne, Crow Creek, and Grand River reservations. Among these supplies there will be a quantity of beef, and the cattle will have to be driven to the different reservations, where they are to be slaughtered, and the beef issued to the Indians. There will doubtless be considerable risk to the contractor in transporting these cattle, owing to the wild and unsettled condition of the country through which they will have to be driven; and, in view of this fact, I respectfully recommend that the Secretary of War be requested to furnish Mr. Bosler with suitable escorts, from Forts Randall and Sully, to the respective reservations, whenever he shall require them.

"Very respectfully, your obedient servant,

"E. S. PARKER, *Commissioner.*

"Hon. J. D. COX,
"*Secretary of the Interior.*"

"DEPARTMENT OF THE INTERIOR,
"*Washington, D. C., June* 21, 1870.

"SIR: Arrangements have been made by the Indian Bureau with James W. Bosler, esq., for the delivery of subsistence supplies for the Indians on the Yankton, Whetstone, Cheyenne, Crow Creek, and Grand River reservations.

"As beef cattle are included in the supplies, which are to be driven to the points above named, I have the honor to request that the contractor may be furnished with suitable escorts from Forts Randall and Sully to the respective Indian reservations, whenever he shall require them.

"Very respectfully, your obedient servant,

"J. D. COX, *Secretary.*

"The Hon. SECRETARY OF WAR."

"WAR DEPARTMENT,
"*Washington City, July* 11, 1870.

"SIR: Referring to your letter of the 21st ultimo, I have the honor to inform you that instructions have been given to the commanding officer at Fort Randall, Dakota Territory, to furnish an escort from that post to Fort Sully, Dakota Territory, to James W. Bosler, for his train of stores and herd of cattle intended for the Indian service, and that the commanding officer at Fort Sully has been directed to furnish an escort from that post to the Yankton, Whetstone, Cheyenne, Crow Creek, and Grand River Indian reservations.

"Mr. Bosler should be notified to apply to the commanding officer at Fort Randall whenever the escort is required, and should also be informed that, owing to the small garrisons, it will not be practicable to furnish more than one escort from each post. The trains and herds must, therefore, be concentrated before leaving Fort Randall.

"Very respectfully, your obedient servant,

"WM. W. BELKNAP,
"*Secretary of War.*

"The Hon. SECRETARY OF THE INTERIOR."

I think I need make no comment upon this conflict further. It can hardly be possible that Commissioner Parker said anything short of the truth when he testified that the Secretary knew all about the matter. The correspondence is definite, both as to the manner in which the emergency was being met and as to the name of the contractor; and I think it must follow that the Secretary was mistaken, and the Commissioner right. I read from General Cox's testimony, page 79:

"Do you say that the Indian Bureau has never made purchases without advertising; that the head of the Bureau has never exercised the discretion of making purchases to meet emergencies according to the view that he might take of them?—A. That is not what I have said.

"Q. I do not understand you to say, do I, that the only form of contract which the Commissioner makes to meet these emergencies, is a contract to be void in case an appropriation act is not passed?—A. We are now speaking of contracts made where there is no appropriation bill passed. Where there are appropriations made for trifling amounts, the agents have often been authorized to make specific purchases. As when an agent is not in communication with the outside world, that is an emergency. I have supposed the power existed, and the office has exercised it. My familiarity with the office is not great enough to say how far they have gone. But I was speaking of large contracts for large amounts of supplies made without the usual forms.

"Q. Would there be any difference in regard to the duty ot the Commissioner to provide for the emergency in the case of the supply for a hundred Indians, or ten or fifteen thousand; would not his action be the same, except proportionately large in one instance over the other? The quantity of supplies he would have to furnish under an emergency would not affect the question if he had to act, would it?—A. Of course it would only affect the caution with which he would proceed. Every man exercises more caution in great matters than in small ones, and persons often exercise a discretion in small matters that they might not in great ones. The question is simply what is best to do in the emergency.

"Q. Then the Commissioner would have to determine that question for himself, or no one could in that matter?—A. Whoever the responsibility is upon must determine it for himself. In the larger matters of the Bureau we expect, of course, more consultation with the head of the Department or with the President than in little ones. If a matter should arise wherein the action of the Bureau might terminate in a war or not, although the responsibility might be with the Commissioner, yet we would expect a greater amount of caution and more consultation than in a less important measure."

By Mr. BECK:

"When such emergencies arose as required the action of the President to meet them, of which you have heretofore spoken, how did he usually meet them, by calling upon the Army or the Indian Department to meet them—for supplies, I mean?—A. Always, before the close of the last fiscal year, he had called upon the Army, because there had been a specific arrangement made with the Army that it should aid in supplying the Bureau. At this time, my impression is that General Parker's embarrassment arose out of the fact that the Commissary Department of the Army had notified him that they could no longer continue the arrangement. That was the basis of his trouble.

"Q. Did the President, so far as you know, meet these difficulties through the Army?—A. Yes, sir; we had had no case before us in which there was any difficulty before. We had always called on the Army, and got the supplies from them. But if the Army were to be left out of the account, of course, then the arrangement would have to be made upon another hypothesis, and that was the supposition, I understand, that existed—that the Army was to be left out of the case; that it declined to make the supplies."

Leaving the effect of the testimony and the correspondence which I have given, to be determined by the committee, I desire to say a word in regard to the Commissioner's not advertising immediately after the appropriation bill passed, so as to avoid the necessity for extending the contract, as he found himself obliged to do in August.

The testimony shows the Commissioner absent during the two or three months following the passage of the appropriation act. The little supervision of the office which he was able to give was done by telegraph and by correspondence; and it was very natural, and certainly not censurable, that he should dismiss to some extent, from his mind, the details of the office at Washington.

Further, it appears that there was an acting Commissioner in charge, who not only had power to take steps to advertise, but whose duty it was; and if any one is to be blamed in this matter, it is Acting Commissioner Cady, and not General Parker. The responsibilities and duties of the office devolved upon Mr. Cady, to the same extent as though he had been Commissioner, and the trust reposed in him as acting Commissioner could well extend to the matter of conducting whatever duties might devolve upon him.

Now, the Commissioner testifies that he was telegraphed to by the Secretary upon some business connected with the office, to return to Washington, which he did about the 9th of August, and then it was when he first discovered that the matter of advertising had been neglected, and then it was that his mind was made to face the question as to whether the provision made in June for supplies would be sufficient to ward off danger until advertisements for proposals could be published. And he determined, upon the facts then before him, that an extension of Mr. Bosler's contract or a new one with some other person was necessary. He therefore took the necessary steps, and on August 10 he called upon Mr. Bosler to furnish additional beef. I read from his letter. The Commissioner says, (p. 147 :)

"It being exceedingly doubtful whether, under any advertisement for supplying the Sioux of Dakota with beef and flour, they can be furnished in proper season to prevent a deficiency, I have to request that you will at once supply 1,500,000 pounds, net, more beef, to be distributed at the various agencies on the Missouri River, in such amounts as shall be hereafter designated to you. Said beef will be paid for at the same rates per pound as is provided in your contract with the Indian Bureau, dated June 17, 1870. This beef must all be on the hoof, and of as good quality as was furnished under your contract, and must all be delivered at the several agencies on the Missouri River on or before the 15th day of October, 1870."

The letter gives the reason for making the contract, and the Commissioner must stand or fall upon the wisdom of his action as further explained in the testimony.

While in Washington, at this time, he gave instructions with regard to advertising;

and we find, August 13, Acting Commissioner Cady addressed a letter to the Secretary informing him that the Indian Office was about advertising for proposals for subsistence, &c. And, August 16, the Secretary replied authorizing the advertisement, and upon the 26th of the month the advertisement was published; and upon the 17th of September following, the contract for beef was let to Mr. Morrow. See Appendix, p. 146–7.

Now the contract of June was intended to cover supplies for sixty or ninety days; and the contract of August, as to beef, covered about the same length of time. The testimony is that the supplies were exhausted at most of the agencies before Mr. Bosler was able to deliver under his first contract; and at some of the agencies, the supplies under that first contract were about exhausted by the time the deliveries began under the extension of August. (See p. 29.)

And, whether the arrangement as to price was a wise one or not, certainly the developments of this trial show that the arrangement as to bringing supplies forward in time to meet the emergency was a wise one. There is one circumstance connected with this question, however, which deserves to be noticed, and as to this I think the Commissioner made a mistake.

It will be recollected that among other agents who were urging on the Commissioner the necessity for supplying these Indians, after the commissary contract expired, Major Poole, the agent at Whetstone, was most urgent. He had been at Washington with Red Cloud and other of the representative Indians, and knew all about the necessities of those agencies. While returning, and on his way to his agency, he telegraphed, June 18, to the Commissioner, "The supplies for Indians at Whetstone agency will be entirely expended by July 10, 1870; all the time will be required to forward more," (p. 140.)

To which the Commissioner replied June 18, "arrangements have been made for subsistence for Indians at Whetstone. The supplies will probably be there early in July," (p. 140.) The arrangements were embraced in the Bosler contract.

Major Poole also wrote the Commissioner the same day he telegraphed, urging immediate steps to forward supplies, (page 141.) Four days after this, however, Major Poole took the responsibility of receiving from the commissary contractor a supply of cattle for three months; and on June 22 telegraphed the Commissioner as follows: "I have enough cattle on hand to last three months. Will the Commissary Department furnish the other supplies? Your answer to this will guide me in closing up my papers with that Department," (p. 142.) To which Commissioner Parker replied the same day: "The Subsistence Department will furnish no supplies after 1st proximo. Other arrangements have been made," (p. 142.) When Mr. Bosler came to make his delivery of beef at Whetstone, according to the contract, Major Poole, having supplied himself upon his own responsibility, as we have stated, declined to receive them without further instructions. Mr. Bosler insisted upon the cattle being received, as the contract had been made; and he relied upon the Department keeping faith with him. Instructions then issued, after a considerable correspondence, directing Major Poole to receive the cattle due under the Bosler contract at Whetstone, although the Department first endeavored to have Mr. Bosler deliver cattle at higher points on the Missouri, instead of at Whetstone. The correspondence upon this subject will be found on pages 142, 143, 144, 145, and 146.

This made a double supply for the time at Whetstone, and although Major Poole testifies that it was no detriment to the Indian service, (p. 207,) an effort has been made by the prosecutor in this case to attach to this transaction some improper motive on the part of the Commissioner. But it would seem to me that no such motive could attach, when he was merely carrying out the terms of the contract made previously, and when the embarrassment which arose was through the fault of one who acted upon his own responsibility, without the knowledge of the Commissioner, and after the contract had been made.

It is in this connection, Mr. Chairman, that I desire to mention a step taken by the Commissioner which I think was a mistake. It is this: When he came to extend the contract with Mr. Bosler, in August, he issued instructions to the various agents along the Missouri River to receive the cattle provided for by the extension contract of August, and, among others, he directed that an installment of this beef should be delivered and received at the Whetstone agency. It was at this agency, and this one only, where there had been an overlapping of supplies, as I have just explained. It was not necessary, therefore, at that time to make provision for the Whetstone agency. But the fact as to this surplus at that agency escaped the Commissioner's attention at the time, and hence his action, which may be said to have been an oversight or mistake. He admits this, and can only say in explanation what I have said. That such a fact should escape his attention is not very remarkable; and a mind which would attribute to him any impure or improper motive, I think, must do so without giving due weight to the circumstances, which might very naturally bring about such an oversight; besides, no detriment to the service followed. His attention, however, was called to the fact later; and when he came to provide for the delivery of beef, under

the Morrow contract, he made the time of delivery at the Whetstone agency the 1st of January, or about the time the supply of beef would be exhausted at that agency.

That his conduct in this matter was the result of any collusive understanding with Mr Bosler, is not to be admitted for a moment. All the circumstances connected with the transaction repel any such inference. Commissioner Parker testified that he had no intention of giving Mr. Bosler the benefit of an extension of his June contract, and that such a thing never entered his mind as extending that contract, until about the time he found it necessary; and of this Mr. Bosler had no knowledge whatever until he received his letter of authority to furnish the supplies.

Mr. Welsh has attached a great deal of importance to the fact that the beef contracted for in June was to have been delivered in installments, of July 15, August 1, and September 1; and that because instructions issued afterward directing the agent to receive the cattle at one time, therefore there must have been some collusion or some bad motive on the part of the Commissioner. Now the Commissioner explained fully that in talking with Mr. Bosler about this contract, he desired that the cattle should be delivered immediately, and at one time; and it was because Mr. Bosler felt it to be doubtful whether he could possibly find cattle in that country at that time in sufficient quantities to be able to do so, that he asked to have the contract made so that he would not be responsible for a breach of it, in case he could not make the immediate delivery of all the cattle. The object of the Commissioner was to get some supplies forwarded at the earliest possible moment, and as there was no particular necessity for an immediate delivery of all, he acceded to Mr. Bosler's request. But when Mr. Bosler found that he would be able to make his purchases in such quantities as to enable him to deliver them at one time, he asked authority to make such delivery, and as that complied practically with the Commissioner's original intention and wish, instructions were accordingly issued. This is fully explained by the Commissioner and Mr. Bosler in their testimony.

But in this very natural conduct of two men engaged in a business transaction, the one buying and the other selling, Mr. Welsh sees only some secret and covert purpose to serve the pecuniary interest of the contractor, to the detriment of the United States. But was it so? He assumes that it involved the necessity of employing herders. So it did to some extent; but not to any great extent, as not many more men are required to take care properly of the number delivered than would have been necessary if they had been delivered by installments. And, furthermore, the Commissioner testifies that additional herders involved little or no expense to the Government, as they were generally taken from among the Indians and employés of the Government at the posts.

But this seems to be a trifling matter, and not worthy to be brought forward in an effort to fix upon Commissioner Parker maladministration of his office.

Upon this question of personal gain to the contractor in this delivery, I remark, further, the testimony is that cattle driven from the Pacific Railroad up to those posts would lose much in weight in the driving, and if permitted to graze a length of time before delivery, they would have picked up what they had lost, and that this would about equal, if not exceed, the cost of herding and care. But I am not disposed to follow this matter; it does not seem to me important. This committee will hardly impeach an officer of the Government on trifles such as these.

THE MORROW CONTRACT.

It is in evidence, Mr. Chairman, that Mr. Bosler, who had this June contract, and the contract of August, also became interested subsequently in the contract for beef supplied under what we understand as the Morrow contract. And an effort has been made to cast suspicion on his contracts of June and August, by connecting him with the contract with Mr. Morrow, made September 17. What the full effect of that connection between Morrow and Bosler can be in this case, it is impossible for me to conjecture, although I have elsewhere endeavored to do so in the argument. I speak of it, however, in this connection, to separate it, once for all, from any of the previous transactions, on account of which an effort is being made to censure Commissioner Parker. Commissioner Parker did not know, until this investigation began, that Mr. Bosler had any connection whatever with the Morrow contract. He has testified that no part of his action in relation to the early contracts had any connection with, or the slightest bearing upon, the Morrow contract, made in September.

I think I might safely assume, then, that the Morrow contract must be left entirely out of view, in considering the effect of Commissioner Parker's conduct, with reference to the making of his contracts of June and August.

IRREGULARITY IN PAYING VOUCHERS.

Perhaps I might as well here, as elsewhere, notice another matter of complaint made by Mr. Welsh, with regard to these contracts with Mr. Bosler; and that is, that there was great irregularity in the payment of the vouchers, and that this payment was made in defiance of the usual checks necessary to secure honesty upon the part of the

contractor. I think this charge groundless; certainly it is unproved. The evidence is that payments were made in the ordinary manner, upon the receipts of the agents at the various agencies, showing that the amounts of supplies had been delivered. These receipts give quantity, weights, and all the facts necessary for administrative action at the Indian Bureau. The vouchers were all submitted to the auditor, and by him passed to the comptroller, who finally ordered payment. The system may be a bad one; the checks may not be sufficient; there may not be ample protection to the Government; but it is the system which has prevailed for many years, and still prevails, not only in the Indian Department, but in other Departments of the Government. Responsibility must rest somewhere. Faith must be reposed in officers whose duty it is to act. Now the persons who received these supplies were military officers, acting as agents, under orders of the War Department. When the accounts came on to Washington with receipts duly signed by them, the Commissioner regarded that as sufficient to warrant his office in recommending payment. What he did in the matter of Bosler's vouchers he has done in hundreds of others, and is still doing in others. There was nothing, then, unusual in the method adopted for the payment of these vouchers.

A specific charge is made in this connection, by Mr. Welsh, in the matter of paying vouchers upon the receipts given by L. H. Roberts, the acting agent at the Cheyenne agency. The correspondence, found in the Appendix, (p. 147, 148,) and the testimony of Mr. Roberts, (p. 33,) explains this fully. The agent, Major Randall, was absent, and had left Dr. Roberts, who was surgeon of the post, in charge, and had given him written authority to act in his absence, and it was during his absence that the cattle arrived and a receipt for them was given. The scales being out of order, Dr. Roberts called to his assistance some of the military officers, including the acting commissary, who were familiar with the method of averaging cattle, and they arrived at the weights in that manner, Dr. Roberts giving a receipt accordingly.

When called to act administratively in this matter, the Commissioner gave to Dr. Roberts's receipts the same credit and faith which he had given to the receipts of other agents, and passed the vouchers accordingly. How he could have done otherwise, in justice to the contractor, I cannot perceive. I know it is in evidence that after Major Randall's return, he fixed up the scales again and weighed what he thought an average of the cattle, and found that Dr. Roberts had certified to a larger weight than the scales showed. But how this was so, Dr. Roberts explains in his testimony, and it also appears in the correspondence, to which I referred. I think, Mr. Chairman, I may safely leave the matter of complaint with this statement.

Possibly I ought not to forget to notice here that, when Major Poole was recalled, a specimen of sugar was handed to him, with the view, I suppose, of establishing the truth of Mr. Welsh's charge, that the sugar furnished by Mr. Bosler was what he calls "molasses sugar," and of inferior quality. (See testimony, p. 97.)

It was not claimed by Mr. Welsh that this was a specimen of the identical sugar delivered; but the witness was called upon to say whether it was similar to that, about which he seemed not to be very clear; nor did he know whether the sugar which Mr. Bosler delivered was made from molasses or not; or that the sugar presented by Mr. Welsh was so made. He was not an expert, and could not give an opinion. He said, however, in that connection, that the sugar delivered by Mr. Bosler was the best kind for the Indians—the kind which they preferred. But whether Mr. Bosler charged more than it was worth, is not proved; and in the absence of such proof, I suppose it not unfair to presume that it was sold at a reasonable price. Certainly no presumption can be raised against the reasonableness of the price, for this is a matter of proof.

Thus, Mr. Chairman, melts away another of the very grave charges presented by Commissioner Parker's prosecutor. I believe that, with this exception, no attempt was made to impeach the quality or prices of any of the articles furnished except beef and flour, and here only as to price, although Mr. Welsh embraced among his sweeping allegations something with reference to tobacco as well. But this he has abandoned, as he has abandoned other charges, without bringing forward any proof to sustain them.

There are, Mr. Chairman, two depositions in the record which may, in the mind of the committee, have some bearing upon the conduct of Commissioner Parker, and this is, perhaps, as proper a place as any to notice them. I refer to the depositions of John Finn (p. 99) and John T. Baldwin, (p. 105.) It will be remembered that when Commissioner Parker was being examined by the committee, he was asked in regard to a conversation said to have taken place between him and Finn, as follows:

"Q. On the 16th of June, or any time shortly before making this contract, did you have a conversation with a man by the name of Finn, of St. Louis, and a man by the name of Baldwin, in which they asked you if you intended to make any such contract, desiring to bid for it if you did; and do you recollect that you replied that you did not intend to make such a contract?—A. I recollect that Finn was here a great deal last winter and summer, and probably about the time you mention he may have asked me again. He inquired at various times in regard to furnishing beef at Whetstone. I do not recollect giving him any such reply as you suggest.

"Q. Did you not state to him that you did not intend to make such a contract at any time; and that you could not make any such contract, because the appropriation bill had not passed?—A. I have no recollection of any such conversation."

Subsequently, Mr. Finn and Mr. Baldwin were called to testify as to any conversation they had with the Commissioner. I cannot believe that the object of the committee was to discredit the testimony of Commissioner Parker by laying a foundation in this manner. I am bound to attribute to the committee, on the contrary, the more liberal motive of arriving at the facts in relation to the matter. Let us see, then, as to the effect of the testimony of Mr. Finn. I believe no one accustomed to weighing testimony would read the deposition of Finn and of Baldwin, and the letter of Finn proposing to furnish certain supplies, (to be found in the record, p. 108,) without rejecting his testimony as valueless. I call attention to certain points in connection with this deposition, and shall endeavor to do so as briefly as possible. In the first place, while the witness nowhere states that he made a proposition to furnish cattle to all the agencies along the Missouri River at four and a half cents a pound, and while no inference to that extent can be derived from his testimony fairly, yet it may be that such inference will be drawn from his testimony. He says, on p. 99:

"I offered him Texas cattle at 4½ cents a pound, and American cattle at 6 or 6½ cents a pound, gross; I cannot say which."

Further, he says:

"I told him I had cattle at the Winnebago agency, and that if he did not consider them worth 4½ cents a pound, I would take less for them; that I wanted to sell them."

In reply to a question whether he had the cattle on hand, he says:

"No; I could not fill a large contract with the cattle I had on hand, but I could fill any contract; I could get the cattle."

On page 100, in reply to the question: "Did he refuse to accept your proposition?" he answers: "He did."

Mr. Finn had a contract previously, or at the time, which was then about expiring, to furnish supplies to a limited extent under a contract with Superintendent Janney, at the Winnebago agency, and it is more than probable that a continuation of this contract was desired by Mr. Finn, although upon this point he is as indefinite as he is with regard to making any distinct proposition.

When Mr. Baldwin was called and was asked as to what passed in that conversation between Mr. Finn and Commissioner Parker, (p. 106,) he makes no mention of any proposition on the part of Finn, with regard to furnishing supplies, further than to continue to furnish them after the 1st of July, as he was then furnishing at the Winnebago agency. It will be remembered this agency was not included among those supplied by Mr. Bosler. After stating what transpired in this conversation, he was asked by the chairman this question:

"Was anything said by Finn with reference to a desire on his part to have another contract?—A. I do not recollect anything."

On cross-examination of Mr. Finn, (p. 101,) he is asked:

"Q. Did you communicate the proposition you made to General Parker in writing?—A. I did.

"Q. And sent it to the Department?—A. Yes.

"Q. Was that the time you had this talk with him?—A. Yes.

"Q. That letter contained your proposition?—A. Yes."

If we turn to that letter, (p. 108,) we find that the proposition which he made was for the supplying of cattle at the Whetstone agency. The letter is as follows:

"WASHINGTON CITY, D. C., *June* 9, 1870.

"SIR: I have the honor to state that I have a large number of American and Indian cattle, left over from my late contract at the Winnebago Indian agency, which I propose to sell to the Indian Department for the use of the Sioux Indians at the Whetstone agency, at the following prices, viz: American cattle from 4 to 7 years old, at 6½ cents per pound, gross weight; Texas or Indian cattle at 4½ cents per pound, gross weight; said cattle to be delivered at Whetstone agency or reservation, as may be required, until next contract is awarded.

"I am, sir, very respectfully, your obedient servant,

"JOHN FINN.

"Hon. E. S. PARKER,
"*Commissioner of Indian Affairs.*"

Now this letter is dated June 9th, and Mr. Finn says (p. 101) that it contained the proposition which he made to Commissioner Parker, and to which he alluded in his testimony, yet he swears that his conversation with, and his offer to supply beef to, the Commissioner, was on the day Bosler's contract was let, namely, June 17. He was mistaken then, in point of time, for he does not claim to have made any other proposition after June 9th, for he says that the proposition which he made to the Commissioner

was embraced in that letter; and if this is true, he could not have made any proposition subsequently. Indeed, he says (p. 101) that the other proposals which he made were previous to the letter, but what they were does not appear. In this letter he represents that he has a large number of American and Indian cattle left over from his contract at the Winnebago agency. In his testimony, (p. 101,) he says he had three or four hundred head, altogether, consisting of cows and steers, and common run of cattle. His letter represents that he had a large number of American cattle, as I have stated, yet in his testimony (p. 100) he says there were no American cattle in that country. Upon being asked whether anything was said about the condition of the Indians or the necessity of furnishing beef to them, he replies, (p. 100:)

"Yes; I told him I had heard from the agent at Whetstone and from other reservations, that the Indians were in great need of stock, and asked him if he was not going to buy them. He told me he would not do it. I asked what he was going to do in regard to supplying these Indians. He said the Indians would protect themselves the same as they did previously; that they could take to the plains and subsist the best they could."

This is the only testimony given by the witness in regard to the interview with Commissioner Parker which is in any way corroborated by Mr. Baldwin. Mr. Baldwin says that the Commissioner told them "that the Indians would have to hunt, or to do as they had been doing before they were getting any supplies from the Government." And also the Commissioner remarked "that he could not make any arrangement for supplies until there was an appropriation by Congress."

I would not say that both these witnesses have purposely misstated this conversation, but as to the Commissioner's seriously expressing to them the opinion that the Indians would have to return to the plains and subsist as best they could, when the Commissioner's mind is shown by the whole record to have been bent solely to the purpose of avoiding any such result, would make the statement seem very improbable.

Now, in point of time, the letter in evidence of John Finn shows that the conversation did not take place subsequent to June 9, and possibly the Commissioner may have, at that time, told these gentlemen that there was no appropriation, and that he could not make arrangements for supplies. But this seems improbable, for the question must have been in his mind at that time, as to how provision was to be made to supply these Indians, although his final purpose was not reached until June 17. The Commissioner had no recollection of any conversation with these gentlemen upon this subject, and hence no explanation appears in the record as to what was in his mind at the time in relation to the matter. We are left only to determine upon the probabilities of the case; first, as to whether the conversation is likely to have occurred; and second, if it did occur, what effect it would have upon the case. The Commissioner has told you that he talked with persons at various times about that date, as to the prices of beef and supplies, and in those conversations it is not improbable that he did not disclose to the persons with whom he conversed what his purpose was, and how he proposed to meet the exigency which he felt was then upon him. He was bound to judge of the character of the men with whom he had in view the making of any contract, and his judgment with regard to individuals was only an incident in connection with the subject, the whole of which rested with him entirely. The great thing to be accomplished at that time was the immediate supply of all the agencies, and the proposition simply to supply one of the lower agencies did not meet the case, and the Commissioner could well decide in his own mind that it would be better to contract with some person whose responsibility was well vouched for to him, who would undertake to supply all the agencies at once.

In connection with the testimony of Mr. Finn, in which he says the letter contained his proposition, (p. 101,) in reply to the question, "Have you the answer to it?" he says, "No, sir, the letter was sent back to me."

He evidently intended to create the impression that the Department sought to rid itself of the evidence that such a proposition was on file about that time. But in this he overreached himself, as he did in others of his statements. For we find, (p. 108,) by the testimony of Mr. McGraw, clerk in the Indian Office, that the original letter was written by this clerk, at the dictation of Mr. Finn, and was signed by him in his presence; and it is the original letter which was introduced in evidence, and brought to the committee from the files of the Indian Department.

There is nothing, Mr. Chairman, in connection with the developments made by this testimony which can cast any suspicion upon the good faith of the Commissioner in making this contract with Mr. Bosler. I have no doubt he weighed fully whatever propositions came from Mr. Finn, and whatever his reasons were, (and I can conceive many good ones for not splitting up the matter of supplying these various agencies among persons in whom he might not have the utmost confidence,) we are bound to conclude that he acted in the best interests of the service, as he then regarded the matter.

Mr. Baldwin also testifies that he went, in company with Mr. Finn, to see if the Commissioner did not want flour for the Indians; but he made no direct proposition with

regard to furnishing flour, either as to price or quality. He says the Commissioner told him he was not prepared to make any contract at that time for flour, but that when the appropriation bill passed he would advertise, and would send the witness a copy of the advertisement. The testimony of Mr. Baldwin shows what he had in his mind, although he did not communicate it to the Commissioner, was, the furnishing of the flour delivered at Council Bluffs. But the Commissioner's idea was to have whatever supplies he concluded ultimately to purchase, delivered at the agencies. And it was much better and safer to rely upon the person who took the contract for all the supplies, to agree also to deliver them. It is probable the Commissioner had not, at that time, made up his mind fully as to how he was to meet the emergency, and I have no doubt he had daily conversations with various persons with regard to the matter, to none of whom did he disclose his plans. Mr. Baldwin was the owner of one mill, and the requirements of the Bureau for supplies of flour, as the testimony shows, stripped all the mills in that region in order to meet the demand. To have purchased directly from the millers, the Commissioner would have been obliged to open negotiations with many different persons, and this he had neither the time nor the opportunity to do.

But, I suppose, Mr. Chairman, that the real object of this testimony was to establish another link in the supposed chain, which would tend to involve the Commissioner in a corrupt bargain. If there were a large number of other suspicious circumstances unexplained, this might be considered in connection with them, and have some weight. But where there is nothing elsewhere in the record, as I think has been shown, to fix any bad motive upon the Commissioner, it cannot be that upon this testimony alone so grave a charge can rest.

The matter of purchases of flour I have examined fully in another part of the argument, and although the Commissioner may have told Mr. Baldwin originally that he intended to advertise in the purchase of flour, it has been fully shown that in determining subsequently to purchase quietly, he acted not only wisely, but saved a large amount of money to the Government. His determination in the purchase of beef has also been fully explained, and I think I may leave the matter safely where it now stands.

I have thus attempted, Mr. Chairman, to group in this connection the various circumstances connected with the contracts in question, which would seem to need explanation.

I have tried to present the facts, as they would occur to any reasonable mind, and have endeavored in this part of the argument to overlook nothing, however grave or however trivial. And I think it will be found that nothing is omitted in this connection which is not elsewhere in the argument.

PURCHASES FOR OSAGE INDIANS.

I believe that no dereliction of duty has been charged upon Commissioner Parker by Mr. Welsh with regard to his purchase of certain presents to be sent to the Osage Indians; yet much time has been spent in investigating that matter. I suppose the discovery of whatever there may be in this transaction is due to the zeal of Mr. Vincent Colyer, who has been a very active coadjutor of Mr. Welsh, in urging forward this prosecution, and has given the aid and benefit of his valuable suggestions and counsel throughout the entire investigation. It is due to Mr. Colyer that this matter in his special charge should not be entirely overlooked. What, then, does it amount to? I quote from Commissioner Parker's testimony:

"Q. Explain about the purchase of the Osage presents in New York City, after the commissioners had left there, at the time they made their purchases of the annuity goods—how you came to do it, and what the purchases were?—A. On the 15th of July last, Congress passed an act for the removal of the Osages from their lands in Kansas to the Indian Territory, and required the assent of the Indians to the provisions of the bill. It was on consultation with Secretary Cox that we thought proper, when the Indians were convened for the purpose of acting upon the matter, that we should furnish them subsistence while attending the council, and give them a small amount of presents in the shape of goods, and, after the council had closed, have these goods distributed. Presents given to Indians who have been convened in council, are generally intended for the chiefs and headmen, and are intended to be of little better quality than those ordinarily supplied, and I gave an order in New York, amounting, I think it probable, to about ten thousand dollars, for a variety of dry-goods, to be distributed among these Indians after the council should have closed their business, for the chiefs and headmen to take home to their families. They consisted of blankets, calicoes, sheetings, and really I do not remember every article I purchased. I have not examined the invoices. I know there were some blankets which, as I understand since, were not acceptable to the members of the Indian commission. I have heard that indirectly from the evidence of Mr. Colyer on the subject. I gave an order to Buckly, Welling & Co., a house in New York dealing largely in Indian goods, for the goods "which I proposed to send out to the Osages. I think I gave the order to them for nearly everything.

"Q. It was stated by Mr. Colyer in his testimony, that the same blankets which had been offered to that commission while there at $6 80, were invoiced at $8. They were scarlet blankets. What have you to say to that?—A. I have not looked at the bills to see whether the statement is true or not. I presume it is. I did not get the blankets of Amidon, Lane & Co., where they saw them, but of Buckly, Welling & Co., though the latter house may have obtained them from Amidon, Lane & Co., for anything I may know.

"Q. When they made their offer at $6 80, how many were to be supplied?—A. My impression is they were to supply something like five thousand pairs of scarlet, some four thousand indigo, and a like number of white.

"Q. How many in fact were purchased for those presents to the Osages?—A. I think pair of scarlet.

"Q. Would there be any difference in the price of 200 pair and several thousand pair, at the same purchase; and if so, to what extent?—A. I have noticed that bidders, as a general rule, have made a difference where they supply a large quantity. Where the supply was small they would be of very nearly what are termed the market-ruling rates—about manufacturers' prices. Where a large number of blankets were ordered, they could generally be obtained at a less price of the merchants than the manufacturers.

"Q. Did you buy at the lowest ruling rates at that time?—A. I did.

"Q. Did the Secretary know about these purchases that were to be made?—A. Yes, sir; he had ordered it.

"Q. Had you any motives in making these purchases of any particular persons—any favorites to whom you wished to extend benefits?—A. Nothing of the kind entered my mind.

"Q. Did or not the commission know that these purchases were to be made?—A. I am not positive. My impression is that I mentioned the fact that presents would be sent to the Osages: but they may have got the impression that the Osage goods were included in the aggregate put down in the advertisement.

"Q. The presents were a separate matter?—A. They were a separate matter. The advertisement quantities were made up from the amounts to which each tribe was entitled as their annual presents."

The order of the Secretary with regard to these purchases is as follows:

"DEPARTMENT OF THE INTERIOR,
"*Office of Indian Affairs, July 22, 1870.*

"COMMISSIONER: I am directed by the honorable Secretary of the Interior to inform you that it is desired to have some presents purchased for the Osages, to be issued to them at the council to be held on or about the 20th proximo, in the country to which they are to be removed; the kind and quantity of the articles to be determined by you.

"Very respectfully, your obedient servant,

"WM. F. CADY,
"*Acting Commissioner.*

"Hon. E. S. PARKER,
"*Commissioner Indian Affairs..*

("Care of Messrs. Buckley, Welling & Co., 370 and 382 Broadway, New York City.")

"It would seem that under such ample authority as this, the Commissioner might safely rest his defense. Yet so much importance has been attached to it, that, perhaps no branch of this investigation fills a greater space in the record. It illustrates to what an extent into minor details of administration, on the part of the commissioner, this inquiry has extended. Let us then examine the length and breadth of this charge. It appears that when these goods were received at the agency, one bale containing 50 blankets was found to be of a different shade of scarlet from the others, and were thought to be inferior in quality. The conclusion was immediately reached that some stupendous fraud was involved in this matter, which ought to be probed to its bottom.

Mr. Gibson, the Indian agent at the Osage agency, immediately wrote Mr. Dodge, at New York, informing him of this discovery. A sample blanket was sent back to Mr. Colyer, the secretary of the commission. Mr. Dodge, of New York, called upon the persons who had furnished the bale of blankets, Messrs. Buckley, Welling & Co., who in turn called upon Messrs. Amidon, Lane & Co., from whom they had purchased them, and all parties waited upon Mr. Dodge, and explained how this bale of imperfectly-dyed blankets had found its way among the goods shipped. It was explained, the witnesses show, to the satisfaction of Mr. Dodge, that the blankets were really as good for wearing purposes as though they had been dyed a different shade. Offers were made by the parties selling the blankets to pay the expenses of returning the bale to New York, and of reshipping another bale to the Indians; but nothing seems to have been done in the matter. No information was communicated to the Commissioner of Indian Affairs with relation to it; and, as he says in his testimony, the first intimation he had of the matter came to him through the testimony of Mr. Vincent

Colyer. Why this complaint should have been concealed from the Commissioner, and reserved for this investigation, is difficult to say; the remedy was a simple one, and could have at once been provided. I do not find that any complaint is made with regard to the purchases generally embraced in these Osage presents. The whole matter of complaint turns upon this bale of forty blankets. Experts have been called from New York City and from Philadelphia. Grave opinions have been expressed with regard to the qualities of certain classes of blankets, manufactured by certain rival houses; and allowing the greatest latitude to the opinions of witnesses, the result of the whole matter, so far as I am able to see it, when reduced to mathematical proportions, is this: that if the Commissioner had known, when he was purchasing these goods, that a bale of dark-red instead of light-red blankets was being sent to the Indians, he could have bought them for 50 cents each less. The mistake he made then, if it was a mistake, amounted to $25, currency, and I do not doubt that, if the matter can ever be brought to his attention officially, or he can ever have an opportunity of calling upon the parties for proper redress, that this $25 will be cheerfully returned to the Treasury of the United States.

But, Mr. Chairman, I would not intentionally suppress anything in connection with this matter. I find among the exhibits a letter of Agent Gibson, which Mr. Colyer may think ought to be considered. How it got into the record I know not, for I suppose the best evidence of its contents or its assertions would be the utterances of the writer from the witness stand. However, the letter is in and it must be met. It is as follows:

"OSAGE AGENCY, KANSAS, MONTGOMERY POST-OFFICE,
"*Tenth Month*, 13, 1870.

"ESTEEMED FRIEND: This day I forward by express to thy address, as per request of Vincent Colyer, secretary of commission, one scarlet blanket, 3-point, and one Mexican blanket; the first as a sample of fifty pair out of two hundred at $8 per pair, sent as presents to the Osage Indians, from the house of Buckley, Welling & Co., New York City, of date August 23, 1870. The remaining one hundred and fifty pair were a grade better. The Mexican blankets are billed at $6 50 apiece. *They are not worth half that money to Indians, as a baby can slip through them without breaking a warp or filling.*

"Very respectfully,

"ISAAC T. GIBSON,
"*United States Indian Agent.*

"W. E. DODGE,
"*Indian Peace Commissioner.*" (P. 162.)

If Friend Gibson were before the committee, it might be interesting to know how "a baby could slip through the Mexican blanket without breaking a warp or filling." I have heard of driving a coach and four through acts of Parliament, but this I always understood to be a figure of speech in which lawyers too often indulge. But now that I find Friend Gibson screening babies through blankets, I am prepared to believe the coach-and-four story.

I wonder if it ever occurred to Friend Gibson that the right thing for him to have done was to report the matter to the head of the Indian Bureau, his immediate superior, and the person to whom all reports of the kind should be made? Or had it been arranged to reserve this delicious morsel for the *coup d'etat* arranged by Mr. Colyer?

It would be unfair to Mr. Colyer not to give his testimony.

I read from page 9:

By Mr. SARGENT:

"Q. Did you see any blankets or other goods in the Osage country of inferior quality—of such quality as would be rejected upon inspection?—A. Yes, sir. We did not see them in the Osage country. They did not arrive there in time, as they ought to have done. We were there three weeks or more negotiating with the Osage tribes, and in the mean time we were waiting for those goods which were to be sent on as presents to the Osages. When the invoices arrived giving the prices of the goods, our attention was called to them by seeing that the price of blankets was considerably higher than the blankets had been offered to us for in New York a few weeks before. We found upon the invoices that there were red blankets there of a certain pattern, style, weight, and number of inches, which were charged at $8 a pair, and which the same house had offered to sell to us in New York at $6 80. Seeing that, we asked Agent Gibson, when those presents arrived after our departure, to see to it that samples were sent on to us at Washington, so that we might see unmistakably that they were the same articles. The samples arrived here a week or two ago, and we found that the blankets which were charged at $8 a pair were the same that had been offered to us in New York at $6 80. We found, also, that the blankets were to be furnished to the Indian department up to the 20th of August. That was the day when we were instructed to report on the Osage grounds to meet the chiefs, and it was understood that those goods were to be there at that time."

Mr. Colyer's testimony is valuable, but it would be more so if it appeared that he saw the blankets when delivered, or was a judge of blankets if he saw them, or had remembered that the offer of blankets at $6 80, embraced some 14,000 scarlet, indigo, and white, and that some of these were of less value in market than scarlet, and that men will be found who could take a contract to deliver 14,000 blankets at a less price each than 200 blankets, or had some knowledge of prices of Mexican blankets, before pronouncing hasty judgment.

Now I beg to read from the testimony of a very respectable gentleman, Mr. Buckley, (of the firm of Buckley, Welling & Co., N. Y.,) through whose firm the awful fraud was compassed which has so aroused Mr. Colyer:

"Q. Look over that bill of goods, and see if you can recollect from the items enough to speak with any certainty as to that being the bill or a copy of it.—A. There are two items here which I can recollect; two bales of Mexican blankets, and four bales of three-point scarlet blankets. My attention was called to them by Mr. Dodge.

"Q. Were those the only items about which you were spoken to?—A. Yes.

"Q. They are the only items about which any question has arisen?—A. So far as my knowledge goes.

"Q. Explain the quality of the four bales of scarlet blankets, and where you purchased them?—A. The four bales of scarlet blankets were purchased by sample from Amidon, Lane & Co., manufacturers and merchants of New York.

"Q. What is the price of those blankets, as stated in that bill?—A. Eight dollars per pair.

"Q. State whether that was the ruling price at that time?—A. Eight dollars per pair is lower than we sold the blankets for as a general thing. We sold those blankets to the Indian Commissioner for $8 per pair. The cost is $8, less 5 per cent. and 5 per cent.

"Q. Is that equivalent to 10 per cent. discount?—A. It is a little less than 10 per cent. It is 5 per cent. off first, and then 5 per cent. off the balance. That was as cheap as we could buy them in the market." (P. 41.)

I now desire to read from Mr. Buckley's testimony as to Friend Gibson's baby sieve, otherwise called Mexican blanket, (p. 42,) which was sold to Commissioner Parker at $6 50 per pair:

"Q. Explain as to the other blanket.—A. The Mexican blanket was complained of as being a loose, slimsy blanket. They were the same blankets that we sold for some little while. They are manufactured by Mr. Dobson, of Philadelphia. They are a blanket that we never had complained of; and in fact we are not able to procure as many bales of them as we had orders for from other parties. We sold them at less than the usual rates. We sold them at $6 50. We paid Mr. Dobson for them $6 25, less, I think, 5 per cent. and 5 per cent. I am not certain in regard to the discount; but I think there were 5 per cent. trade discount, and 5 per cent. for cash."

The witness then explains that the bill of goods furnished by him was at the lowest rates in market at the time; that they were bought by sample, and he supposed all were equal to the sample; that he explained to Mr. Dodge how the mistake occurred; that several thousand blankets can be bought at less each than 200, &c.

Mr. Amidon, of the firm of Amidon, Lane, and Company, merchants, of New York, from whom Mr. Buckley bought, is then called. Mr. Amidon explains how the "bad for color" bale got into the invoice; that he explained to Mr. Dodge to his satisfaction, and says: "I offered to send for that bale at our own expense, and deliver another bale at our own expense, or to do anything that he cared to have done about it;" further, he says: "I think I fully satisfied him that the blanket was a good one, with the exception of the defect in dyeing," (p. 44.)

I quote from his testimony as to price, (p. 45:)

"Q. Were the blankets, with the exception of color, as good for all purposes as the others sent at the same time?—A. Yes, undoubtedly.

"Q. This mere defect in color would not deteriorate the value of the blanket for its use.—A. Not in my opinion. These blankets were very much more serviceable than such blankets ordinarily are.

* * * * * * *

"Q. Examine the item of four bales of scarlet blankets charged in this bill, and state whether the amount charged for them there is the proper price?—A. I see they are charged here at $8 a pair.

"Q. State what relation that bears to the ruling rates in the market at that time.—A. Scarlet blankets then and now were worth a dollar a pound. I am selling them now at a dollar a pound. I sold those blankets to Buckley, Welling & Co., at a dollar a pound, with an extra discount. I am in the habit of selling them goods, as they are large purchasers, at less than I sell to anybody else."

This seemed not to be quite satisfactory to the committee, and Mr. Amidon is asked a further question, which I give, with its answer, (p. 45:)

"Q. Do you say that the blankets bought from John Dobson at $8 a pair were not

superior to the blankets you have described?—A. I think the scarlet blankets were bought from John Dobson at $7 a pair. I bid at $6 80."

Again the witness says, (p. 45:)

"Q. I understand that, in your bid for the 14,000 blankets, there were comparatively few scarlet blankets.—A. I think 2,700 scarlet blankets.

"Q. Would you have bid for 14,000 scarlet blankets at $6 80?—A. No, sir; I meant to convey that impression to you, that I would not have bid for scarlet blankets so low.

"Q. Were you furnishing any scarlet blankets to the trade at that time, August 23?—A. Yes, to the merchants who deal in that article.

"Q. What were the rates then?—A. $8 for that quality of blanket.

"Q. And the Government paid no more than other persons paid at that time?—A. No, sir; no more than I was getting for them from everybody at that time."

Mr. Amidon believes in the Amidon blanket, and hence, when speaking of the merits of his blankets, he is quite direct in his answers. When asked as to the comparative merits of his and Dobson's blankets, he says his are worth as much as the Dobson blanket. In this Mr. Buckley corroborates him, and says among buyers there is a difference of opinion.

Of course, Mr. Chairman, this matter could not rest here. Mr. Dobson was called, and he answers as flatly as Mr. Amidon, but to a different purport. Mr. Dobson believes in the Dobson blanket.

To those who are dealing in blankets, I invite the perusal of this testimony. Possibly they might be able to learn which is the better blanket, but I doubt it, (pp. 68, 69.)

Then comes an expert in the Dobson blanket, Mr. Stewart Wilson, but he never has been able to understand why merchants buy the Amidon blankets at all. He thinks there is nearly a dollar a pair difference between the Dobson blanket, which sells at $8, and the badly-colored blankets of Amidon, (pp. 69, 70.)

Now, Mr. Chairman, I ask again, what does all this amount to? I believe if the Commissioner could make these purchases over again, he might avoid buying a "bad for color" bale, or if he bought it, might save as I have computed it, making fair allowances for exaggeration of witnesses, say $25. He might, too, spare 49 poor Indians the mortification of wearing a blanket of a darker tint than their more fortunate fellows are sporting in. Beyond this I cannot see, except that by calling upon Mr. Colyer to return the one scarlet and one Mexican blanket he is holding on to, he might return them to Messrs. Amidon, Lane & Co., and get credit on account of $14 50, their cost, which would almost cover losses.

But, Mr. Chairman, *de minimis non curantur*. You will hardly take notice of trifles, and this certainly is of that class.

THE BOARD OF COMMISSIONERS NOT CONSULTED.

The Commissioner is charged with violating the third section of the act approved July 15, 1870, in that he did not consult with the board of commissioners as to his purchases of the provisions for the Indians on the Missouri River, and did not call upon them to inspect the provisions delivered. The same charge, as we have already stated, is made with reference to the transportation contract, and the purchase of the Osage presents, and the inspection of bacon at Chicago. I suppose, Mr. Chairman, if we admit that it was the duty of the Commissioner, under the law, to have done what he omitted to do, it ought not to go very hard with him, unless it should be made to appear to your minds clearly that some great wrong or injury to the Government has resulted from this omission of duty. I suppose it is no unusual thing for officers of the Government to depart from the letter of the law almost daily in the administration of the affairs of the Government, and it is only when such a departure results in injury, that the officer is, or deserves to be, criticised. Now, there is nowhere in this record, from first to last, the slightest evidence showing that the result would have been otherwise had the commissioners been consulted. There is nowhere proof that the provisions were inferior in quality or short in quantity. Indeed, it seems to be admitted that both quality and quantity were unexceptionable, except it may be as to one lot of cattle delivered at the Cheyenne agency, where the weights were arrived at by average, the scales being then out of order. But this is fully explained in the testimony of Roberts, (pp. 38, 39, 40,) and by the documentary evidence in the Appendix, pp. 146, 147.

It does not seem to me, Mr. Chairman, that you should conjecture as to results had the board been consulted, in order to arrive at the guilt or innocence of Commissioner Parker in this matter. And certainly, in the absence of proof that the result would have been otherwise had he consulted the board, I cannot see any just ground for censure. But I do not admit that he violated this third section of the appropriation act of July last, and to this I now invite your attention.

ORGANIZATION OF THE BOARD.

This board was appointed by the President under the provisions of the fourth sec-

tion of the act of April 10, 1869, and by the third section of the act of 1870, which Commissioner Parker is charged with violating, is continued under the provisions of this third section, with the powers as conferred upon it by the act of 1869. We must go, then, first to that act to determine what those powers were. Those two acts are strictly *in pari materia*, and it is not possible to determine the powers of the board without construing the two sections together. The act of 1869 placed the board under the direction of the President to "exercise joint control with the Secretary of the Interior over the disbursements of the appropriations made by this act, or any part thereof that the President may designate." Following that act, an Executive order issued June 3, 1869, which will be found on page 80 of the record, the fourth paragraph of that order provides as follows:

"They are authorized to be present, in person or by sub-committee, at purchases of goods for Indian purposes, and inspect said purchases, advising with the Commissioner of Indian Affairs in regard thereto."

Paragraph 5 provides as follows:

"Whenever they shall deem it necessary or advisable that instructions of superintendents or agents be changed or modified, they will communicate such advice, through the office of the Commissioner of Indian Affairs, to the Secretary of the Interior; and in like manner their advice as to changes in modes of purchasing goods, or conducting the affairs of the Indian Bureau proper."

Paragraph 7 provides as follows:

"The usual modes of accounting with the Treasury cannot be changed, and all expenditures, therefore, must be subject to the approvals now required by law and by the regulations of the Treasury Department, and all vouchers must conform to the same laws and requirements, and pass through the ordinary channels."

It will be perceived that, by this fourth paragraph, they are "authorized to be present," &c. But the duty is not imposed upon them, nor is the duty imposed upon the Commissioner to consult them. Paragraph 5 authorizes them to give "their advice as to changes in modes of purchasing goods, or conducting the affairs of the Indian Bureau." But it does not make it the duty of the Commissioner to consult them with regard to the affairs of that Bureau. Paragraph 7 disconnects them from any responsibility with relation to the payment of vouchers or expenditures under the law, and requires that the vouchers shall conform to the law, and pass through the ordinary channels. With regard to the powers of this board, Mr. Brunot, its president, testifies, (p. 12:)

"We did not expect to manage the expenditure of the funds of the Department."

Again, (p. 13:)

"The acceptance of the powers given to the commission in the original instance was a qualified acceptance, and the words in which we accepted the powers were communicated to the President. We acted with this idea, that so far as it was practicable for us, with our other duties and engagements, we would accept of the trust he had reposed in us. In the same way, under the last act of Congress, we accepted it with a similar qualification. * * * * * * *

"We understood our duties were to bear such a relation to the Indian Department originally as would not impose upon us the control of the executive business, which belonged to the Commissioner of Indian Affairs, but that our duties were supervisory. * * * * * * * *

"It was not for me or for our board to stand over the Commissioner of Indian Affairs, watching his movements, and demanding of him to come to us for the purpose of consulting us. That is the explanation which I wish to give of the action of our board."

Again:

"Q. State whether you regarded yourselves as the managers of the Indian Bureau in any sense.—A. No, sir.

"Q. Or of its affairs or its administration?—A. No, sir.

"Q. Did you regard yourselves as charged with the administration of any of the laws connected with that Bureau, except as defined by those two acts?—A. No, sir.

"Q. Did you regard yourselves as having supervisory control over the Commissioner, such as to compel him to do what he did not want to do?—A. I cannot say that I at any time regarded our board as superior in authority to the Commissioner of Indian Affairs. I do not think it can have been intended that we should take the Commissioner's business and do it ourselves.

"Q. Have you ever had any occasion to complain to the Commissioner, or to suggest to him that he was doing wrong with reference to the letting of any contract?—A. No, sir."

I quote again from page 9, testimony of Mr. Colyer, secretary of the board:

"Q. With regard to your instructions, which you have interpreted, did not your board also claim that it should have the right to disburse all the funds, and was not that the question that was early raised with reference to the duties of the board?—A. No, sir; our board did not claim that.

"Q. What was the claim by your board about which some controversy arose?—A. That was before I was a member of the board.

"Q. That matter was before the Secretary?—A. I think it was raised by Mr. Welsh, then our chairman; but my impression is that it was not raised by the board."

Also, on page 11:

"Q. Does your board take the ground that the Commissioner has the sole power of purchasing?—A. Certainly; that is the law.

"Q. When he makes the purchase he performs his duty?—A. Yes.

"Q. And when you supervise you perform yours?—A. Yes.

"Q. It is his duty to act first in the matter and last in the matter?—A. Yes. In our interpretation we simply supervise, and all that we can do under that law, as I understand it, is to protest, and the Commissioner can finally act, even against our protest.

"Q. The final decision is left with him?—A. Yes.

"Q. And the responsibility of the purchase is with him?—A. Yes."

Now, this is about all that can be said with regard to any definition of the powers of the board under the original act. All the authority is contained in the law and the executive order. The phrase "joint control over disbursements" was early defined by the President and Secretary of the Interior, and acquiesced in by the board, as not in fact placing the board in charge of the disbursement of funds, or fixing upon them any responsibility for that disbursement. And all the authority to inspect goods or supervise their purchase is to be derived from the paragraphs which I have quoted, and none of these impose upon the Commissioner the duty of calling upon the board. Provision is simply made authorizing the board to inspect purchases, and advise with the Commissioner when they choose to do so. I think, therefore, that under the construction given to the law conferring joint control upon the Secretary of the Interior and the board, the Commissioner of Indian Affairs complied with the law fully in managing the affairs of his Bureau upon consultation with the Secretary, and this consultation was full, frank, and open.

We come now to notice section 3 of the act of July 15, 1870. That act, as I have already stated, continues the commission as created by the act of April 10, 1869. In addition to the duties imposed upon the commission by that act of 1869, the following appears:

"And it shall be the duty of said commissioners to supervise all expenditures of money appropriated for the benefit of Indians in the United States, and to inspect all goods purchased for said Indians, in connection with the Commissioner of Indian Affairs, whose duty it shall be to consult said commission in making purchases of such goods."

Precisely what is meant by the phrase "supervise all expenditures of money" is not easily to be determined. I think that no more meaning can be attributed to it than the phrase in the former law, "exercise joint control with the Secretary of the Interior over the disbursements of the appropriations," &c. The power under the former act, indeed, was greater than the latter, for the power of "exercising joint control" is certainly greater than that of "supervising expenditures." And yet we have seen that the interpretation given to the former statute took away from the board any control over the disbursements, and the board has never, I believe, pretended that they had any such authority as that of a control over the disbursements or expenditures of money. Certainly, no one reading the clause in the former act and the executive order and instructions under it, would, after the passage of the second act, regard the powers of the board as enlarged by the provision which I have just quoted. To supervise is to oversee. To control is to exercise a restraining influence over, to govern, to overpower.

I come next to notice another clause, to which more importance is attached. Referring to the duties of the board, the law says:

"And to inspect all goods purchased for said Indians, in connection with the Commissioner of Indian Affairs, whose duty it shall be to consult said commission in making purchases for such goods."

Now, Mr. Chairman, I invite your attention to the language of that clause. And, first, it will be observed that there is a joint duty conferred, in the first branch of the phrase, upon the Commissioner and the board, to *inspect* all goods purchased for the Indians. That inspection, in the very nature of the case, cannot be personally done by either the board or the Commissioner. The Commissioner regarded himself as discharging his duty when the inspections were made by his various agents. And this was done.

But it will be noticed that the first branch of this clause relates to inspection, while the second and last one relates to purchases of these goods; the provision being, "whose duty it shall be [that is to say, the Commissioner's] to consult said commission in making purchases of such goods." I think the law imposes upon the board as great an obligation as upon the Commissioner; that is, any failure on their part, resulting in injury to the Government, should be answered for to the same extent the Commissioner of Indian Affairs is called upon to answer. And I do not think that, in the ab-

sence of any injury arising from non-consultation by either party, or a failure on the part of either to inspect goods, any grave responsibility is incurred—that anything blamable is to be attached to them.

But the principal question here to be noticed is, as to the proper interpretation of the word "goods." The opinion has been expressed during the course of this trial, and for the first time has been brought to the attention of the Commissioner of Indian Affairs, that the word "goods" embraces provisions, that is, beef, bacon, &c., and I suppose, if the charges against the Commissioner are to be sustained in this regard, it must be held also to apply to transportation. The Commissioner's interpretation of that word is given in his testimony, which I will quote:

"Q. Did the matter come up in your mind as to whether the term 'goods,' used in the appropriation act approved July 15, 1870, embraced the matter of supplies generally, and, if so, what interpretation did you give to the statute?—A. I have never had but one impression, until recently, on this subject, which was that the term 'goods' generally used in the appropriation act did not embrace what we call subsistence or provisions.

"Q. Do not the laws distinguish between the two, and in this same appropriation act do not these two items appear separately?—A. They appear separately as a general thing, and I suppose there is where I got my impression.

"Q. Did you feel that it was your official duty to consult the board of commissioners in regard to this matter of provisions or subsistence, and did the question come up in your mind as to whether it was your duty to consult them?—A. I did not regard it as my duty to consult them.

"Q. Was that the reason you did not consult them?—A. That was the only reason. There were members of the board here during the month of June, and probably some portions of the month of May. We had conversations in the office in reference to the condition of Indian affairs, and the necessity of furnishing supplies to these particular Sioux. Red Cloud with his delegation, Spotted Tail with his, and another chief of another tribe up the Missouri, whose name I do not remember, were also here. Members of the commission were here, and, in my judgment and belief, the necessity was fully recognized by them of keeping these Indians supplied," (p. 28.)

And on page 29 he says:

"Q. What was the reason in your mind for not calling on the board of commissioners to inspect these provisions, as you did call upon them in regard to the goods?—A. I had no doubt in my mind, after the passage of the act of July 15, that they were directed by the law of Congress to inspect goods purchased, and I called upon them with that view; but I did not understand that the same requirements extended in reference to supplies. It would be often very inconvenient to bring them up to inspect every purchase and supervise every expenditure made under the extension."

Again, on page 32.

"By Mr. SARGENT:

"Q. Do I understand you to say you think the words 'Indian goods' do not include flour, bacon, tobacco, coffee, and sugar?—A. My impression is that, in a reading of the law, goods are made a separate item.

"Q. Where the law of 1869 provided that they should exercise joint control over the disbursements of appropriations made by that act, did not that, in your judgment, include expenditures for cattle, flour, tobacco, and coffee?—A. Very likely it did; but the execution of that law absolutely, with such a construction, would be utterly impossible, for they would have to come to the Indian Office and supervise every disbursement made under the Indian bill."

I think, Mr. Chairman, that the interpretation put upon the law by the Commissioner was not a strained one. I think it is one that might naturally suggest itself to him. You will find, upon examination of this same appropriation act, that the term "goods" is used distinct from "provisions." The distinction doubtless grew out of appropriations for annuity goods, and it will be found to run through all the laws upon this subject; and even in the treaty stipulations we find the phrase "annuity in goods," "annuity in money." As I understand it, the matter of feeding or supplying the Indians is distinct from that of furnishing them the goods under treaty stipulations. Annuity goods are a fixed and regular purchase, and follow year after year. But provisions and supplies vary with the necessities, and are never used, in the common parlance of the Indian Bureau, or in the statutes, as embraced in the phrase "Indian goods." I think, Mr, Chairman, that if you will examine the executive order heretofore alluded to, you will find confirmation of this view. Paragraph 4, which I have quoted, authorized the board to be present in person at purchases of goods for Indian purposes. This was done in 1869, and Mr. Brunot speaks of their sub-committee making purchases in connection with the Indian commissioner at New York. But they were not, during that year, called upon to assist in purchases of provisions or supplies, nor did the board claim their right so to do.

Mr. Brunot says that the board came to the conclusion that the word "goods"

was intended to cover all the expenditures of the Indian Department for whatever purpose; but this construction, he says, was never communicated by the board to the Commissioner of Indian Affairs, (p. 13.) It would not be difficult to suggest many things tending to show the fallacy of Mr. Brunot's construction; for example, all expenditures of the Indian Department cover clerical hire, fuel, and other expenses incident to the office itself, laborers and various employés, agents, and officers throughout the Indian country, transportation, and many other things which cannot, by any torture, be brought within the meaning of the word "goods." There was put in evidence, and is to be found on page 10, a letter of Mr. Brunot to the Commissioner, of June 3, 1870, calling his attention to the fact that the board is intrusted with the duty of advising with the Commissioner of Indian Affairs in regard to the purchase of goods, and inquiring at what time the spring purchases would be made, and the services of the board required. This letter was answered by the Commissioner three days after the appropriation bill passed, and manifestly, from the language of the answer, the Commissioner must have supposed that Mr. Brunot referred only to the goods then about to be purchased in New York City. For what purpose this correspondence is put in is not quite clear; but if it is to help to elucidate the meaning of the act of July 15, some very extraordinary result must be expected from it, for Mr. Brunot would hardly have attempted an interpretation of the act over a month before its passage.

The only fair inference which I can derive from his letter is, that the board had regarded itself as charged with the duty of advising with the Commissioner in the purchase of what are generally known as annuity goods. These are usually purchased in the spring, and hence we find the inquiry as to what time the spring purchases would be made. He could have made no reference to provisions and supplies for Indians, for he knew nothing of the condition of the Indian Department in that particular. There is also put in evidence, in connection with Mr. Colyer's deposition, the correspondence between him and Mr. Sargent, of the Appropriation Committee, (p. 160.) Mr. Colyer asks Mr. Sargent's opinion as to the meaning of the clause of the statute now under consideration. He says it is more particularly with reference to the first clause as contained in the first three lines. The interpretation given by Mr. Sargent differs from the view I am now presenting, although his letter in reply to Mr. Colyer does not seem to have been written with the idea in his mind that any question would arise as to the meaning of the word "goods," and that question is therefore really not decided in his letter. But that correspondence was not known to the Commissioner, and is for the first time brought to his attention in this trial. Like the discovery made by Mr. Colyer with regard to the Osage presents, it was reserved for such use as might be made of it in this investigation. The fact is, General Parker interpreted the law naturally and honestly, and executed it accordingly. If he had entertained a suspicion that a different view was held by the board from his own, no one who knows the efforts made by him to maintain the best relations with that board would doubt that he would have brought it to their attention. I cannot help expressing the opinion that if the board itself had felt this matter to be one of consequence, and had regarded the Commissioner as excluding them from any proper participation in the affairs of his office, they would have brought it to his attention. The gentlemen composing the board are not churls, nor are they cowards. They assumed their duties, and have performed them, at great personal sacrifice. They are men of standing and character.

They could afford to speak frankly and openly with regard to all matters about which they had cause for complaint. They could not afford to conceal anything, and I do not believe they did conceal anything. Beyond the conduct of Mr Colyer, and the great interest he has shown in prosecuting this case, there is not to be found a single instance which tends to show the slightest want of confidence on the part of the board in the present Commissioner of Indian Affairs. It is certainly a little remarkable that the secretary and mouthpiece of the board, who is by law charged with the responsibility of performing certain duties in connection with the Commissioner of Indian Affairs, and between whom and himself there should be not only confidence, but the closest relations, should attend this investigation night after night, aiding the prosecutor in the accomplishment of a purpose to remove the Commissioner of Indian Affairs. I do not believe that Mr. Colyer, in such a position, indelicate and improper as it must seem to any mind to be, can be acting under the authority of the board of commissioners.

But this is a divergence, Mr. Chairman, not important, and which I must beg pardon for having indulged in. The question here is, whether the Commissioner of Indian Affairs is to be censured for having discharged a duty devolved upon him by law, without consulting the board, which he did not at the time believe it was his duty under the law to do. You must in this, as well as in other points connected with this investigation, give some weight to motives; and where the motive was not a bad one, and no evil consequences followed from the conduct of the officer, it certainly cannot be the duty or province of this committee to condemn.

It is no unusual thing in private, as well as in official life, and in the management of private as well as public affairs, for one man to take upon himself the responsibility of performing duties which are made incumbent upon two or more. The law which originally created this board gave them joint control over all the disbursements of the Indian Department, and yet that control was practically taken away from them by the Executive order; and I do not suppose that out of the millions of dollars disbursed by the Interior Department under that act, the board of commissioners were called upon, or had an opportunity even, of participating in the disbursements of one-fiftieth part of it. That law did not require the Secretary, it is true, to consult the board, in terms; but how else could they have joint control without consultation; and if he failed to consult them or furnish them the opportunity of exercising that joint control, was he less to blame than Commissioner Parker in the subsequent law which made it his duty to consult the board? We have never heard any investigation contemplated into the conduct of the Secretary of the Interior, or of the Commissioner of Indian Affairs, under that law, nor have we ever heard of complaint being made against the President for practically annulling that clause which gave joint control over all disbursements. Why is it, then, Commissioner Parker is alone to be charged with the gross offense of violating the law of the land? Why is he to be made a victim for doing that than which nothing is more common in and out of official life?

OTHER SUGGESTIONS.

Mr. Chairman, if this were the first instance where an officer of the Government dared to take responsibilities in the administration of official duties, it might not be remarkable that public attention should be drawn to it; but, sir, as I run back over the last decade, and reflect upon the perils to our nation's life, which a strong hand has averted with public approval, where even the law had to be borne down and set aside, I cannot believe an honest officer, in the honest discharge of duty, well performed, will at this day be the first to suffer for his courage where he violated no law.

We do not need to go beyond the last two or three years, or beyond the Indian service, to find examples of fearless discharge of duty in cases not unlike this.

How long is it, Mr. Chairman, since General Sherman, in connection with the members of the peace commission created by Congress, incurred an expenditure without authority of law vastly greater than was involved in that portion of Commissioner Parker's purchases, which were made under an emergency?

How long is it since General Sherman, on a single telegram to the governor of Montana, authorized the raising of troops, to be paid by the National Government, involving an expenditure of a million of dollars, for the payment of which Congress has made provision?

Who has had the temerity to attack General Sherman or the peace commission?

Who has ever sought to arraign General Harney for feeding the same Indians for whom Commissioner Parker made provision, although General Harney, without authority of law, incurred an expenditure vastly beyond that which Commissioner Parker incurred?

Who has dared to insinuate that General Sherman was in fraudulent collusion with contractors because he paid large prices for beef, much larger than General Parker paid? Who ever thought of bringing General Harney before a committee in Congress for paying almost three times as much for flour as Commissioner Parker did?

It is in evidence, what every public man familiar with the management of Indian affairs knows, that ever since the Indian Bureau has been in existence, it has been the custom of the office to provide for the Indians as Commissioner Parker did. The Indian Office has been arraigned over and over again, and probably more discussion has taken place in and out of Congress upon the management of Indian affairs than upon any other, and I have yet to learn of an effort having ever been made to convict an Indian Commissioner of violation of law for making provision, as Commissioner Parker did. The necessity for sometimes resorting to open market purchases and contracts without advertisement, has been recognized by every administration, and I think I may say every Congress. With this knowledge, and these precedents to guide him, how monstrous it is to assail Commissioner Parker upon this ground!

If Mr. Welsh desires to keep the Indian Office free from outside rings and corrupt combinations, Heaven help him; but if he expects to reform our public service by wholesale charges of corruption that have no foundation except in his own fertile brain; if he hopes to reassure public confidence by destroying the faith the people have in their public servants, through the means of a vexatious and heartless pursuit of those in official position; if he hopes to engraft upon our Indian management the benign influences of the church through an unchristian method of attack; if he hopes to elevate the Indian by openly declaring, as he has, that the President has put into the office to which they look for protection one who is but a remove from barbarism, thus stigmatizing the whole race; if he believes that the Christian people of this land are to join him in a crusade against this representative of the Indian by groundless

accusations; if, in short, he intends to work out certain theories of his own under cover of Christian philanthropy, without regard to consequences, he will find he has undertaken that which will recoil fearfully upon him, and which will awaken an indignant protest from every honest heart.

Mr. Chairman, you and others are not blind to the general results of the President's policy, so ably carried out in its details by the Indian Bureau; you have seen no Indian wars desolating our borders since its inauguration; your Committee of Appropriations have had no millions to provide, as heretofore, for large numbers of troops to avenge the murders of our frontier citizens, and repress the warlike spirit of the Indians; the dollars expended by Commissioner Parker, have been units to the tens previously expended; since this trial began you have provided for additional of the warlike savages, who are coming in to be fed and to acquire our habits of life, and you know the general feeling which pervades the people along the border is, that we must hold out every encouragement in the direction now being taken; you know, for you have had frequent intercourse with the Commissioner, how earnestly he has bent his energies to second the wishes of the President and Congress in this regard. Is it, then, too much to ask that these things be considered? At the worst, this record shows only that the Commissioner has been too bountiful in his supplies of food, although it does not appear that a pound of provisions has been wasted; at the worst, he has erred in not feeding the Indians from hand to mouth, keeping their minds full of doubt each day as to their subsistence for the next. I believe, Mr. Chairman, Commissioner Parker has no regret that he chose the course he did. By doing so, he has convinced the Indians that the Government is in earnest, and that it may be trusted.

It may well be asked, what would have been the gravamen of Mr. Welsh's complaint had a timid policy been pursued at the juncture we have considered, and an Indian outbreak been the result? I doubt not he would then have held the Commissioner responsible for not doing the very thing of which he now complains.

But, sir, a subject of this gravity is not to be judged by the cost of a few thousand pounds of beef or sacks of flour; or an accidental side of bacon, with a rib in it; or a few barrels of sugar made of molasses; or the difference between the cost of shipping goods up the Missouri River in the spring and fall; or the cent per cent. bargainings by which some men amass large fortunes in cities like Philadelphia.

Gentlemen in public positions, called upon to assume responsibilities unknown to urban merchants, learn to take broader views of affairs of state. The experience of your committee, Mr. Chairman, as public men, furnishes some guarantee that Commissioner Parker will be judged from the standpoint of statesmanship, and not that of a tradesman, who, however honest amd well-meaning, may be very narrow when he comes to view subjects new to him.

FRAUD.

There is a graver subject than any we have directly considered in connection with this investigation. And that is, whether there was fraud in the transactions of the Commissioner of Indian Affairs in the matter of letting the contracts in question. It is a common thing, in this very sensitive age, to attribute bad motives to men where good ones are not positively shown. And men have a loose way of expressing themselves as to the conduct of public officers, in which "fraud" and "corruption" are used interchangeably with "mistakes" and "blunders." Now, there are some rules of law upon this subject which it may be well enough to bring to the notice of the committee.

Actual fraud is not to be presumed, but ought to be proved by the party who alleges it.

If the motive and design of an act may be traced to an honest and legitimate source equally as to a corrupt one, the former ought to be preferred. (Conrad *vs.* Nicoll, 4 Peters, 295; Clark *vs.* White, 12 Peters, 178; Garrow *vs.* Davis, 15 Howard, 272.)

This is the rule of law laid down in all the books, and need but be stated to remind the committee of the rule.

Fraud may be proved by circumstances; yet, if an act do not necessarily imply fraud, it is not to be presumed. (Gregg *vs.* Sayre, 8 Peters, 244; Tardy *vs.* Morgan, 3 McL., 358; Henckly *vs.* Henderson, 5 McL., 170.)

These are rules familiar to all lawyers, and I suppose will not be denied.

I do not know, Mr. Chairman, that I ought to go so far as to admit that your committee entertain now any suspicion of fraud or corruption on the part of the Commissioner, as I may seem to do by suggesting any consideration of this subject.

Mr. Welsh has stopped short of a direct charge of corruption. He has been careful to utter no libelous words which the law will take hold of and punish. Whatever his indiscretions and extravagances of speech and pen, he has been shrewd enough to avoid personal liability.

But, Mr. Chairman, he has suggested that, considering such and such things, he

thinks it "more than probable there was collusion in an attempt to defraud the Government;" but between whom he is vague and uncertain as to his meaning.

(See charge tenth, p. 127.)

I ask the committee to read charge tenth, and notice the reasons given for the belief of Mr. Welsh as to fraudulent collusion.

Of the four facts given for this belief, but a single one is proved by evidence, and that is, that Mr. Bosler is a partner in the Morrow contract; a fact which Commissioner Parker did not know until this investigation began; a fact, too, which, had he known it at the time, would not imply any collusion.

So far as the basis of Mr. Welsh's imagined fraud is concerned, it has not so much in it as the baseless fabric of a vision.

I am not disposed to recite the circumstances in the case from which fraud is to be inferred, if at all. They have been fully presented in connection with other questions, and I can only say that I believe now Mr. Welsh even will feel called upon to abandon the suspicion with which he entered upon the prosecution of this case. I ought not, perhaps, to overlook in this connection, while speaking of the absence of evidence of fraud, the fact that Mr. Welsh has pursued this phantom to such an extent as to bring before the committee the private bank account of Mr. Bosler. Mr. Welsh resides in Philadelphia, and his position there enabled him to institute, in a manner not altogether creditable to the parties, an inquiry into the bank account of Mr. Bosler. On the 28th of January, during the progress of this trial, Mr. Jay Cooke, from Philadelphia, telegraphed to New York as follows:

"DATED PHILADELPHIA, PA., —— 28, 1871.

[Received at 2.57, January 28.]

"*To Jay Cooke & Co., New York City:*

"Send by Monday's mail, to H. D. Cooke, Washington, copies and detail of deposits, draughts, and other transactions by J. W. Bosler and General Ely S. Parker, since May last, and have them certified by sub-treasurer. Answer.

"JAY COOKE."

That this dispatch was suggested by Mr. Welsh no one can deny, for it is not to be supposed that Mr. Jay Cooke cared enough about this investigation to enter upon such an inquiry without the suggestion of some one, and who else could have made it but Mr. Welsh? On the same day Jay Cooke's partner, Mr. Fahnestock, replied to this telegram as follows:

[Received at Philadelphia.]

"TO JAY COOKE:

"[Copy.] January twenty-eight. General Parker never had any transactions with us. Bosler, now in office, has had large deposit accounts with us for two years, never asking accommodations, and is entitled to consideration accordingly. Is it proper to send details of his account?

"H. C. FAHNESTOCK."

When Mr. Cooke, on receiving this reply, showed it to Mr. Welsh, he ought to have been satisfied, but it seems he was not, and hence, on February 3, we find brought before the committee (without opportunity to object, if we had desired to make an objection) the books showing Mr. Bosler's transactions with that bank for the year 1870. The closest examination into the checks of Mr. Bosler reveals no connection between him and the Commissioner, and, as we have seen, Mr. Fahnestock telegraphed that Commissioner Parker had had no transactions with that bank. Whether Mr. Welsh's examination into private bank accounts ended here I cannot say. But the zeal which led him to go to this extent doubtless has led him to make similar inquiry into all the banks of this city and elsewhere, where he had the slightest suspicion anything could be ascertained derogatory to the Commissioner. It is, perhaps, fortunate for Commissioner Parker that he has but a sorry bank account, if any; for no one could convince Mr. Welsh, if he should find $50,000 anywhere to the credit of Commissioner Parker, that that fact alone would not establish the corruption of the Commissioner.

I would remind the committee of the fact that all the witnesses with whom any collusion is hinted at have answered the question directly as to whether the Commissioner had any pecuniary interest in any transaction connected with this investigation. The Commissioner was himself asked the direct question as to any pecuniary interest he may have had in any of these transactions; and I need only say that the answers of all the persons implicated contained the fullest and amplest denial of any connection as charged. These persons, including the Commissioner, are either perjured men, and you must so hold, or else you must find that the Commissioner's integrity is spotless and without taint.

What I have said, Mr. Chairman, in this summing up of the testimony, has been, as you know, under great pressure as to time, and without any opportunity of knowing the view which the committee may take, or the theories which may be urged on the committee by Mr. Welsh, in the paper which I believe he intends submitting to the committee. I have earnestly endeavored to cover the whole case, and have sought to omit nothing which would in any way tend to arrive at the truth of the matter.

If I am to judge of what views will be taken by Mr. Welsh from his fulminations through the public press, even since this investigation began, and his efforts to have the case prejudged, I am prepared for almost any misstatement of facts, and false and unwarranted conclusions. The committee ruled, in the course of the investigation, that the motive which led Mr. Welsh to institute this prosecution was not competent evidence, although enough appears in the record to establish the fact that he has had a long-cherished purpose of accomplishing the removal of Commissioner Parker from office, (see p. 62,) and that he expressed the opinion that he would have been successful at the time he resigned from the board of commissioners, had they followed his example and resigned also. I was prepared to prove that while he was in the West, pretending to act under direct authority from the President of the United States, he was insidiously poisoning the minds of the Indians against those who are appointed to manage their affairs, and that he even went so far as to offer money to procure evidence which would lead to the removal of Commissioner Parker. But this I was not permitted to show, and, perhaps, properly; for, after all, it matters little what Mr. Welsh's motive was, the chief inquiry being as to whether the administration of Commissioner Parker has been good or bad. I speak of this, however, Mr. Chairman, not to detract from any just criticisms Mr. Welsh may make upon the testimony, or belittle any just conclusions which he may reach; but to caution the committee against receiving any statements made by him in any paper he may submit as purporting to be sustained by the record, unless upon examination of the record he shall be found to be sustained.

In conclusion, then, Mr. Chairman, you must allow me to thank you and the members of the committee for the permission to present my views in this case, and as they are not given for any other view than that of assisting in the development of the truth with regard to the case, and are given in the interests solely of my friend, Commissioner Parker, I ask in his behalf that they may be duly considered, and if not inconsistent with the rules of procedure in such cases, that they may accompany the record in the case when it shall be submitted to the House of Representatives.

ADDENDUM.

I ought perhaps to add, in the matter of the payment of money to the Quapaw Indians, whereby the attorney received one-third, that General Parker had nothing to do with the payment.

I speak of this, lest he may be connected with it in some manner. The evidence relieves him from any participation in the transaction, and I suppose the committee will so find.

41ST CONGRESS, 3d Session. } HOUSE OF REPRESENTATIVES. { REPORT No. 40.

TWO PER CENT. CLAIM OF ILLINOIS, INDIANA, AND OHIO.

FEBRUARY 27, 1871.—Ordered to be printed and recommitted to the Committee on the Judiciary.

Mr. KERR, from the Committee on the Judiciary, made the following

REPORT.

The Committee on the Judiciary, to whom was referred House resolution No. 379 to construe a statute therein named, having had the same under consideration, beg leave to submit the following report:

The object of the resolution is to construe the second section of the act of March 3, 1857, entitled "An act to settle certain accounts between the United States and the State of Mississippi and other States." For the better understanding of the whole subject, the entire text of the act is here set out:

That the Commissioner of the General Land Office be, and he is hereby, required to state an account between the United States and the State of Mississippi, for the purpose of ascertaining what sum or sums of money are due to said State, heretofore unsettled, on account of the public lands in said State, and upon the same principles of allowance and settlements prescribed in the "Act to settle certain accounts between the United States and the State of Alabama," approved the second of March, eighteen hundred and fifty-five; and that he be required to include in said account the said reservations under the various treaties with the Chickasaw and Choctaw Indians within the limits of Mississippi, and allow and pay to the said State five per centum thereon, as in case of other sales, estimating the lands at the value of one dollar and twenty-five cents per acre.

SEC. 2. *And be it further enacted*, That the said Commissioner shall also state an account between the United States and each of the other States upon the same principles, and shall allow and pay to each State such amount as shall thus be found due, estimating all lands and permanent reservations at one dollar and twenty-five cents per acre.

To indicate the "principles" referred to in the foregoing act, the text of the act of March 2, 1855, "to settle certain accounts between the United States and the State of Alabama," is here also fully embodied:

That the Commissioner of the General Land Office be, and he is hereby, required to state an account between the United States and the State of Alabama, for the purpose of ascertaining what sum or sums of money are due to said State, heretofore unsettled, under the sixth section of the act of March second, eighteen hundred and nineteen, for the admission of Alabama into the Union; and that he be required to include in said account the several reservations under the various treaties with the Chickasaw, Choctaw, and Creek Indians within the limits of Alabama, and allow and pay to the said State five per centum thereon, as in case of other sales.

The policy of the Federal Government toward the States out of which these claims arose was adopted prior to 1802. It was based upon the agreement of all new States at the time of admission into the Union that they would waive and not exercise, for the period of five years after entry, their right to tax all lands within their respective limits purchased of the United States. This condition was imposed by the United States in aid of immigration and settlement, and was

assented to by the States on condition that five per cent. of the proceeds of the sales of all public lands within their respective limits should be allowed and paid to the States respectively, or expended by Congress for their use and benefit. These agreements and conditions were not in all cases precisely the same; but their differences were not such as to impair or modify the general policy in which they had their origin. All the States embraced within that policy have, without a single exception, entirely refrained from taxing lands purchased of the United States until the period of five years had elapsed from the date of purchase. They have thus kept faith with the Federal Government, and thereby, whatever rights accrued to them, respectively, by reason of this policy, became vested, and, so far as they have not heretofore been, they ought now to be observed and protected. These rights have been in good faith fully recognized and awarded by the Federal Government in behalf of the States of Louisiana, Arkansas, Michigan, Wisconsin, Kansas, Iowa, Minnesota, Florida, Alabama, Mississippi, Missouri, Oregon, Nebraska, and Nevada, and in one form or another, as the result of arrangements satisfactory to both parties, each of them has had the full benefit of the reserved five per centum.

In the early history of the legislation on this subject, it will be found that the mode of payment, investment, or disposition of this fund was determined by laws applying to the several States separately. But, to avoid the frequently recurring necessity for such special enactments, the second section of the act of March 3, 1857, was passed. That section made it the duty of the Commissioner of the General Land Office to "state an account between the United States *and each of the other States, upon the same principles, and to allow and pay to each State such amount as shall thus be found due, estimating all lands and permanent reservations at* $1 25 per acre." This language is clear and specific, and its intent and purpose are too obvious to need argument. The "other States" are required to be settled with on the liberal and just principles on which the settlements were made with the States of Mississippi and Alabama. When settlements are to be made, it is declared to be the duty of the Department to *allow* and *pay* the amount so found to be due. There is nothing in this section which prescribes one rule for one State and a different rule for another in the adjustment of these accounts. No words in the act indicate any purpose or intent to charge any State with any set-off. No exception or restriction is made against any States.

The States of Illinois, Indiana, and Ohio have severally enjoyed, under different laws, the benefit of the fund in question to the extent of three per centum, or three parts of the five per centum. But the other two per centum has been withheld. Should it be allowed and paid? The object of the joint resolution under consideration is to give an affirmative answer to this inquiry by construction of the act of March 3, 1857.

Ohio was the first State admitted, and from time to time there was paid to it three-fifths of this fund, to be expended under the direction of its legislature in making roads within the State. But the other two fifths the Federal Government reserved the right to expend in making public roads leading from the navigable waters emptying into the Atlantic to the State and *through the same.* (See acts of April 30, 1802, and March 3, 1803, relative to admission of Ohio.)

The State of Illinois, under like enactments, received three-fifths of this fund to be expended in the advancement of its educational interests under the direction of its legislature. The other two fifths of the fund were to be expended in making roads leading to the State. (See act of

April 18, 1818, relative to admission of Illinois, and Brightley's Digest, p. 310, conditions 3 and 4, of section 3.)

The State of Indiana, under similar laws, enjoyed the use of three-fifths of the fund in making roads and canals therein. The other two-fifths were to be expended by Congress in the construction of a road or roads leading to that State. (See act of April 11, 1818, and Brightley's Digest, p. 416, and 3 Statutes at Large, p. 424.)

The United States never discharged their obligations, or performed their trust, toward these States in the expenditure of the two-fifths of this fund, unless, in the judgment of Congress, the futile attempt to lay out and construct a road, called in the laws on the subject, the "Cumberland road," constitutes a performance of those duties. That road, as originally projected and subsequently extended, was intended to connect by a great national highway the East with the West, running through the capitals of Ohio, Indiana, and Illinois, and terminating at Jefferson City, in the State of Missouri. It will scarcely be contended by any person that the design of Congress in this respect was ever executed. It was not carried out to any such extent, or in any such manner, as even to constitute any just, equitable, or legal claim against those States. It cannot be said that it was a compliance in spirit or letter with the terms upon which the two-fifths were retained.

These views are very greatly fortified by the fact that, when the legislation of 1857 was enacted, that "Cumberland road" had been for long years abandoned; had been surrendered to the States through which it was projected without conditions; had ceased to be Federal property or under Federal control; had passed out of popular memory, and was remembered only in history. It cannot, without a manifest stretch of imagination, be claimed to have been in the legislative mind when the act of 1857 was passed. The road was not referred to in any of those enactments. Its existence was not made the basis of any charges against those States. Neither was any condition imposed upon, or any charge made against, any of them when that road was surrendered to them, so far as it was within their respective limits. Besides, the parts of that road which were within the States of Maryland, Virginia, and Pennsylvania were given to those States respectively without any charge or claim, or expectation of repayment in any way whatever, directly or indirectly.

It is further worthy of remark, that, by reason of intrinsic difficulties in the subject, it would be impossible to make an account against any of those States for money expended in the partial construction of that road, except upon the most fanciful, if not absurd, principles of accounting. But why make any such claim against those States when none such was ever made, or ever will be made, against any other States? Why deny to these States equal consideration or equity, or even liberality, with any other States?

It is proper further to observe that the privilege of taxing the lands of their citizens for the period of five years, after their purchase by the citizens from the Federal Government, which was so surrendered by the States, would have realized to them respectively, if it had not been so given up, very much more than the amount which they now claim. In other words, it was the surrender of a valuable right, the giving of a full equivalent by the States for the promised five per centum. So far as that fund has not been accounted for to these States, it remains in the custody of the United States as a sacred trust; and, in our judgment, its adjustment and payment ought not to be longer delayed. We might here refer at length to the numerous decisions in the past by committees of either

House of Congress, by Commissioners of the General Land Office, and by competent and distinguished officials, maintaining the validity of the claims of these States. But it is deemed proper to let the subject abide upon its own merits in the judgment of the House.

The committee, in conclusion, recommend the passage of the following joint resolution as a substitute for the one referred to them:

JOINT RESOLUTION declaring the true construction of a statute.

Be it resolved by the Senate and House of Representatives of the United States of America in Congress assembled, That the true intent and meaning of the second section of the act approved March three, eighteen hundred and fifty-seven, entitled "An act to settle certain accounts between the United States and the State of Mississippi and other States," is that all the other States, to wit, Ohio, Indiana, and Illinois, which have not received the full amount of their five per centum of the net proceeds of the sale of public lands lying within their respective limits, as mentioned in their several enabling acts, in money, shall have their accounts stated, both on the public lands and reservations, and such cash balance as has not been paid to said States allowed and paid.

41ST CONGRESS, 3d Session. } HOUSE OF REPRESENTATIVES. { REPORT No. 41.

CHOCTAW NATION.

FEBRUARY 27, 1871.—Ordered to be printed and recommitted to the Committee on the Judiciary.

Mr. KERR, from the Committee on the Judiciary, made the following

REPORT.

The Committee on the Judiciary, to whom were referred the memorials in behalf of the Choctaw Nation, having had the same under consideration, respectfully report:

That, in their judgment, under the tenth and forty-fifth articles of the treaty of April 28, 1866, between the United States and the Choctaw and Chickasaw Indians, (14 Stat. at Large, p. 769,) the Choctaw Indians are entitled to $250,000 of bonds of the United States, to be issued to them by the Secretary of the Treasury, under the direction of the President. The treaty is the supreme law of the land, and the President is charged with its execution as a ministerial duty. It appears to be clear that his authority to execute it, by the delivery of such bonds to the proper authorities of the Choctaw Nation, is complete under the treaty and existing laws and practices of the Government, without additional legislation. Under date of September 29, 1870, the Secretary of the Treasury, Hon. George S. Boutwell, referred the subject for investigation and opinion to the Attorney General, and that officer, on December 15, 1870, responded in the following opinion:

DEPARTMENT OF JUSTICE,
December 15, 1870.

SIR: In answering the question propounded in your letter of the 29th of September, 1870, it is necessary that I should consider a series of treaties and statutes.

In the treaty of June 22, 1855, with the Choctaw and Chickasaw Indians, (11 United States Stat., p. 611,) it was provided that certain claims of the Choctaws against the United States set up under a prior treaty should be submitted for adjudication to the Senate of the United States. The Senate does not appear to have ever adjudicated the claim by any separate action; but in the Indian appropriation act of March 2, 1861, it was provided that there should be paid "to the Choctaw nation or tribe of Indians, on account of their claim under the eleventh and twelfth articles of the treaty with said nation or tribe made the 22d of June, 1855, the sum of $500,000; $250,000 of which sum shall be paid in money; and for the residue, the Secretary of the Treasury shall cause to be issued to the proper authorities of the nation or tribe, on their requisition, bonds of the United States, authorized by law at the present session of Congress; provided that in the future adjustment of the claim of the Choctaws, under the treaty aforesaid, the said sum shall be charged against the said Indians." (12 United States Stat., p. 238.)

In the Indian appropriation bill of July 5, 1862, (12 United States Stat., p. 528,) it was provided "that all appropriations heretofore or hereafter made to carry into effect treaty stipulations, or otherwise, in behalf of any tribe or tribes of Indians, all or any portion of whom shall be in a state of actual hostility to the Government of the United States, including the Cherokees, Creeks, Choctaws, Chickasaws, Seminoles, Wichitas, and other affiliated tribes, may and shall be suspended and postponed wholly or in part at and during the discretion and pleasure of the President;" and the President was further authorized to expend any unexpended part of previous appropriations for the benefit of said tribes, for the relief of such individual members of the tribes as had been

driven from their homes and reduced to want, on account of their friendship to the Government.

In the Indian appropriation act of March, 3, 1865, (13 United States Stat., p. 562,) the Secretary of the Treasury is authorized and directed, in lieu of the bonds for the sum of $250,000 appropriated for the use of the Choctaws in the act of March 2, 1861, "to pay to the Secretary of the Interior $250,000 for the relief and support of individual members of the Cherokee, Creek, Choctaw, Chickasaw, Seminole, Wichita, and other affiliated tribes of Indians who have been driven from their homes and reduced to want on account of their friendship to the Government.

On the 28th of April, 1866, a treaty was made with the Choctaw and Chickasaw Indians, (14 United States Stat., p. 769,) the tenth article of which is in the following words: "The United States reaffirm all obligations arising out of treaty stipulations or acts of legislation, with regard to the Choctaw and Chickasaw Nations, entered into prior to the late rebellion and in force at that time, not inconsistent herewith; and further agrees to renew the payment of all annuities and other moneys accruing under such treaty stipulations and acts of legislation from and after the close of the fiscal year ending on the 30th of June, in the year 1866." The forty-fifth article is in these words: "All the rights, privileges, and immunities heretofore possessed by said nations, or individuals thereof, or to which they were entitled under the treaties and legislation heretofore made and had in connection with them, shall be, and are hereby declared to be, in full force, so far as they are consistent with the provisions of this treaty."

The Choctaw Indians have made requisition on the Secretary of the Treasury for bonds of the United States to the amount of $250,000 under the act of March 2, 1861; and the question upon which you desire my opinion is, whether such bonds may law fully be issued to them.

Without considering the effect of other legislation on the subject, I am of the opinion that the act of March 3, 1865, withdrew from the Secretary of the Treasury the authority, vested in him by the act of 1861, to issue the bonds; and unless that authority is revived in the treaty of July, 1866, it does not now exist. But I am further of opinion that such authority is revived by that treaty, if a treaty can have such effect.

By the treaty the United States reaffirm all obligations arising out of treaty stipulations or acts of legislation, with regard to the Choctaw and Chickasaw Nations, entered into prior to the late rebellion and in force at that time. In every reasonable sense of the word "obligations," as used in that treaty, the provision in the act of 1861, for issuing the bonds, was an obligation. Liberal rules of construction are adopted in reference to Indian treaties, (5 Wall., p. 760.) It was an obligation which grew out of a treaty stipulation and an act of legislation in part execution of a treaty stipulation. It was entered into prior to the late rebellion. It was in force when the rebellion began. Thus it answers every part of the description in the treaty.

The sections of the treaty above quoted, together with others of its provisions, place these Indians, as to all dues from the Government, just as they stood at the outbreak of the rebellion in April, 1861. To reaffirm obligations arising out of a repealed act of legislation must signify the restriction of the parties to the positions in which they stood when the act of legislation was in force.

The serious question, however, does not relate to the meaning but to the authority of the treaty of 1866. The statute of March 3, 1865, repeals the direction of the Secretary of the Treasury in the act of March 2, 1861. The treaty undertakes to revive that direction. Is such an act within its competency?

By the sixth article of the Constitution treaties as well as statutes are the laws of the land. There is nothing in the Constitution which assigns different ranks to treaties and to statutes. The Constitution itself is of higher rank than either by the very structure of the Government. A statute not inconsistent with it, and a treaty not inconsistent with it relating to subjects within the scope of the treaty-making power, seem to stand upon the same level and to be of equal validity; and, as in the case of all laws emanating from an equal authority, the earlier in date yields to the later.

In 1791 Mr. Madison wrote as follows: "Treaties, as I understand the Constitution, are made supreme over the constitutions and laws of the particular States, and, like a subsequent law of the United States, over preëxisting laws of the United States; provided, however, that the treaty be within the prerogative of making treaties, which no doubt has certain limits." (Writings of Madison, vol. i, p. 524.)

In the United States *vs.* The Schooner Peggy, (1 Cranch, p. 37,) the Supreme Court of the United States, in an opinion delivered by Chief Justice Marshall, held, in effect, that a treaty changed the preëxisting law, "and is as much to be regarded by the court as an act of Congress."

In Foster and Elam *vs.* Neilson, (2 Peters, p. 253,) the Supreme Court say: "Our Constitution declares a treaty to be a law of the land. It is, consequently, to be regarded in courts of justice as equivalent to an act of the legislature, whenever it

operates of itself without the aid of any legislative provision;" and, in applying this principle to the case before them, say that if the treaty then under consideration had acted directly upon the subject, it "would have repealed those acts of Congress which were repugnant to it."

In Taylor *vs.* Morton, (2 Curtis, C. C. R., p. 454,) it was held that Congress may repeal a treaty so far as it is a municipal law, provided its subject-matter is within the legislative power of Congress.

The just correlative of this proposition would seem to be that the treaty-making power may repeal a statute, provided its subject-matter is within the province of the treaty-making power.

Attorney General Cushing, in 1854, after a full examination of the subject, came to the conclusion that a treaty, assuming it to be made conformably to the Constitution, has the effect of repealing all preëxisting Federal law in conflict with it." (Opinions, vol. vi, p. 291.)

Hamilton says: "The treaty power binding the *will* of the nation must, within its constitutional limits, be paramount to the legislative power, which is that will; or at least, the last *law* being a treaty, must repeal an antecedent contrary law." (Works of Hamilton, vol. vi, p. 95.)

Again: It is a question among some theoretical writers whether a treaty can repeal *preëxisting laws.*

This question must always be answered by the particular form of government of each nation. In our Constitution, which gives, *ipso facto*, the force of law to treaties, making them equal with the acts of Congress, the supreme law of the land, a treaty must necessarily repeal an antecedent law contrary to it, according to the legal maxim that "*leges posteriores priores contrarias abrogant.*" (*Ibid.*, vol. vii, p. 512.)

An engagement to pay money is certainly within the province of the treaty-making power, and I cannot perceive that such an engagement is carried beyond that province by the circumstance that it provides for issuing through the agency of a particular officer an obligation to pay money at a particular time; for such, in effect, is a bond.

Can the Secretary of the Treasury issue the bonds without a new direction from Congress? In other words, is the treaty a law for him, or can he know no laws except such as are passed by Congress?

The Secretary is an officer of the executive department of the Government. It is established by a long course of authoritative opinion and conforming practices that, in many cases, the Executive of the United States can execute the stipulations of a treaty without provision by act of Congress. In some instances this has been done as a general executive duty, when the treaty itself pointed out no particular mode of execution. This was the course taken in the case of Thomas Nash, otherwise called Jonathan Robbins, who was delivered up by the direction of President Adams to the British authorities, in execution of the treaty with Great Britain of 1794. An attempt to bring the censure of Congress upon the President for this act was encountered by an argument from Chief Justice Marshall, then a representative from Virginia, which conclusively established the power. In other cases the President has acted when the mode of action was pointed out in the treaty.

In the treaty of Washington of 1842 there was a provision for extradition of criminals. Prior to any legislation for carrying out this provision of the treaty it was executed by officers of the United States. In 1845, James Buchanan, Secretary of State, issued a warrant for the arrest of certain persons, subjects of Great Britain, who were charged with a crime committed under British jurisdiction and against British laws, and it was decided by Mr. Justice Woodbury, upon the return to a writ of *habeas corpus*, that the warrant and the arrest were legal. (1 Woodbury & Minot's Rep., p. 66.) The learned justice remarks: "It is here only on the ground that the act to be done is chiefly ministerial, and the details full in the treaty, that no act of Congress seems to me necessary." (*Ibid*, p. 74.)

Attorney General Nelson, in discussing this treaty, remarks: "It has been made under the authority of the United States, and is the supreme law of the land. It has prescribed by its own terms the manner, mode, and authority in and by which it shall be executed. It has left nothing to be supplied by legislative authority, but has indicated means suitable and efficient for the accomplishment of its object. It needs no sanctions other or different from those inherent in its own stipulations, and requires no aid from Congress. Surely it cannot be necessary to invoke the legislative authority to give it validity by its reënactment." (4 Opinions, p. 209.) This language may be fitly applied to the treaty with the Choctaws.

I am aware of the distinction which has been taken between such treaties as do and such as do not import a contract, and of the current notion that, in the former case, Congress must act before the treaty can be executed. But the practice of the Government in extradition treaties and in other sorts of international covenants has been at variance with this notion.

If the Executive may constitutionally execute a treaty for delivering persons to a

foreign jurisdiction, it may well feel authorized by the Constitution to execute a treaty that stipulates for the less important matter of issuing bonds.

According to article 1, section 9, of the Constitution, as construed by the practice of the Government, an act of Congress is necessary to appropriate money to pay the public debt, however created. The change of the form of the debt, from a general stipulation in the treaty to bonds with particular provisions, does not take away that necessity. The time for the exercise of whatever power Congress has over the subject will come when provision for the payment of the bonds is to be made.

Waiving all discussion of the desirableness, on grounds of expediency, of immediate authority from Congress, and responding to your question according to my judgment of the law of the case, I am of opinion that you may lawfully issue the bonds to the Choctaws.

Very respectfully, your obedient servant,

A. T. AKERMAN,
Attorney General.

Hon GEORGE S. BOUTWELL,
Secretary of the Treasury.

Your committee, after careful inquiry, fully concur in the reasoning and conclusions of the Attorney General, and they deem it unnecessary, therefore, to make any further detailed statement of their views.

The committee, therefore, recommend the adoption of the following resolution to dispose of the subject:

Resolved, That the President, having full authority under existing laws and the treaty of April 28, 1866, between the United States and the Choctaw Nation of Indians, to issue and deliver to said nation $250,000 of United States bonds, no further legislation of Congress is necessary to that end.

41ST CONGRESS, 3d Session. } HOUSE OF REPRESENTATIVES. { REPORT No. 42.

BILLS FOR RAISING REVENUE.

FEBRUARY 27, 1871.—Ordered to be printed and recommitted.

Mr. HOOPER submitted the following

REPORT.

The committee of conference on the part of the House, charged with the duty of conferring with the conference committee appointed by the Senate to consider the question of privilege raised by the resolution of the House adopted January 27, 1871, *in reference to Senate bill* (S. 1083) "*to repeal so much of the act approved July* 14, 1870, *entitled 'An act to reduce internal taxes, and for other purposes,' as continues the income tax after the* 31*st day of December, anno Domini* 1869," *report:*

That, after full and free conference, the joint committee of conference were unable to agree, and the committee on the part of the House, in reporting that disagreement, respectfully submit the reasons which formed the basis of their action in the joint committee of conference.

Congress passed an act approved July 14, 1870, imposing duties upon certain imported articles and admitting other articles free of duty; also imposing certain internal taxes, including a tax on income, and repealing other internal taxes.

On the 26th January, 1871, the Senate passed a bill, (S. 1083,) originating in that body, which repealed so much of the act of July 14, 1870, as continues the income tax after December, 1869. Believing this bill, thus originating in the Senate, to be one which the first clause of the seventh section of the first article of the Constitution required to originate in the House of Representatives, and, therefore, an invasion of the privileges of the House, when it came over from the Senate on January 27, 1871, the House immediately adopted the following resolution:

Resolved, That the Senate bill (S. 1083) "to repeal so much of the act approved July 14, 1870, entitled 'An act to reduce internal taxes, and for other purposes,' as continues the income tax after the 31st day of December, anno Domini 1869," be returned to that body, with the respectful suggestion on the part of the House that section vii, article 1, of the Constitution vests in the House of Representatives the sole power to originate such measures.

The bill was returned to the Senate with a copy of said resolution.

The Senate thereupon asked for a committee of conference on the resolution, with which the House at once complied, as an act of courtesy, the question involved being the *privilege* of the House.

At the meetings of the joint committee of conference, the Senate conferees, Messrs. Scott, Casserly, and Conkling, submitted and maintained throughout the conference:

First. That the words "all bills for raising revenue shall originate in the House of Representatives," in the seventh section of the first article of the Constitution, mean only bills the direct purpose of which is to raise revenue *by the levy of taxes, imposts, duties, or excises.*

Second. That a bill may originate in the Senate to repeal a law or portion of a law imposing such taxes, duties, imposts, or excise, even if the repeal of such repeal render

necessary the imposition of other taxes; and Senate bill (S. 1083) being such an act, it is within the constitutional power of the Senate to originate it.

Your committee on the part of the House maintained in reply:

That, according to the true intent and meaning of the Constitution, it is the right of the House of Representatives to originate all bills relating directly to taxation, including all bills imposing or remitting taxes; and that in the exercise of this right the House of Representatives shall decide the manner and time of the imposition and remission of all taxes, subject to the right of the Senate to amend any of such bills, originating in the House, before they have become a law.

These assertions of the true intent and meaning of the constitutional provision being directly at variance, and the conferees, after a long and full discussion, adhering in substance to their respective understanding and construction of the meaning and intent of the words referred to in the seventh section of the first article of the Constitution, it was agreed to close the conference, and that the conferees should report to their respective bodies their disagreement, and such further report as either of them might deem expedient in explanation of their disagreement.

The importance of the question involved in this conference is the apology of your committee for presenting at some length the reasons which controlled them in adhering to the principles they asserted in the joint conference.

To understand the subject fully requires an examination of the origin of the clause of the Constitution referred to, the construction hitherto given to it by the two Houses of Congress, and the construction given to it by learned commentators on the Constitution.

The members of the convention which framed the Constitution naturally looked to the British constitution as a model, and studied its provisions with care. The clause now under consideration was a subject of much discussion, of great deliberation, and of frequent conference in that convention, as affecting the balance of power between the Senate and House of Representatives, then deemed of great importance in its effect on the relations of the States having large territory and population with the smaller States of limited territory and population. The history of this clause shows that the language finally adopted was a compromise in the convention between those who advocated the adoption of the theory of the British constitution, and those who insisted that both Houses should have equal power to originate money bills. It was not a simple question of prerogative that was contended for, but an important principle was involved; the power to originate money bills being considered a safeguard against the oppression of the people by the Executive; and that the power should, for that reason, be lodged in the body which most nearly represented, and was most directly controlled by, the people.

For a fuller understanding of this subject we will briefly refer to the origin and growth of the provision, in the British Parliament, relating to money bills. The right of the Commons to originate them is of such ancient origin that there is no record of their right being questioned for three centuries prior to 1671. In that year, in a conference with the House of Lords, the Commons refused to furnish precedents to sustain the right, but asserted it as a fundamental right and the privilege of the Commons to originate all money bills. Previous to that time the Lords had amended that class of bills, when sent to them by the Commons, as appears from numerous cases in the journals of the Commons, in which the amendments of the Lords were agreed to. The Commons, in that year, advanced their claim further by a resolution "That in all aids given to the King by the Commons the rate of tax

ought not to be altered." And on July 3, 1678, the following resolution, adopted by the Commons, excluded the House of Lords from all power of amending such bills:

Resolved, That all aids and supplies, and aids to his Majesty in Parliament, are the sole gift of the Commons; and all bills for the granting of such aids and supplies ought to begin with the Commons; and that it is the undoubted and sole right of the Commons to direct, limit, and appoint in such bills the ends, purposes, considerations, conditions, limitations, and qualifications of such grants, which ought not to be changed by the House of Lords.

The Lords having acquiesced in the principle thus enunciated, all proceedings between the House of Lords and the Commons in matters of supply have since been based on this resolution; so that now this class of bills are never amended in the House of Lords, or changed in any way to affect the sense or intention of the Commons. Even in bills not confined to matters of aid or taxation, it has been held "that the Lords could not amend so as to alter the intention of the Commons with regard to the amount of the rate or charge, whether by increase or reduction, its duration, its mode of assessment, levy, collection, appropriation, or management, or the persons who shall pay, receive, manage, or control it; or the limits within which it is proposed to be levied."

This sole exercise of power, so resolutely maintained by the British House of Commons for more than five centuries, is founded upon the idea—

First, that the House of Commons is an elective body, for a limited period, and amenable to constituencies, composed of the body of the King's subjects;

Second, that the House of Lords is an hereditary body,the members of which continue for life; and that the body itself is perpetual, and can be increased according to the will of the sovereign; a body not amenable to the people, and being the creation of the King, is likely to be under his influence. This, in brief, is the history and practice in England relating to money bills.

In the United States, under the original articles of confederation, the General Government was maintained by requisitions made upon each State, apportioned upon the lands in the several States. This system of furnishing supplies to carry on the Government proved totally inadequate for that purpose, as some of the States refused or neglected to pass the necessary laws to comply with the requisition of the General Government, which was thus left dependent on the mercy or caprice of the different States of the confederation—a condition entirely inconsistent with every idea of vigor or efficiency in the Government.

Alexander Hamilton, speaking of this system, says: "The present confederation, feeble as it is, intended to repose in the United States unlimited power of providing for the pecuniary wants of the Union. But proceeding upon an erroneous principle, it had been done in such a manner as entirely to have frustrated the intention." So that, when the framers of our Constitution entered upon their great work, no one subject engaged their attention more seriously than that of taxation. Indeed, Mr. Hamilton says: "It is the most important of the authorities proposed to be conferred upon the Union."

The question of taxation at once presented itself in connection with the question of representation. Under the confederation each State had an equal voice; and the smaller States insisted that in any amendments to the "articles," or in the adoption of any new plan, the States should continue to have an equal voice. The larger States insisted that this was an unjust principle, and that either population or wealth, or both, should form the basis of legislative action; that unless a new rule

was adopted embodying these ideas, it would be within the power of the small States to impose unjust burdens upon the large States; or, as Dr. Franklin stated in the convention:

> The diversity of opinions turns on two points. If a proportional representation takes place, the small States contend that their liberties will be in danger. If an equality of votes is to be put in its place, the large States say their money is in danger. (Elliott's Debates, vol. 5, p. 226.)

This contest for power between the large and small States is the origin of the clause in our Constitution now under consideration.

After long deliberation and diverse action in the convention, the equality of the States was recognized in the constitution of the Senate, thus giving small States like Rhode Island and Delaware an equal voice and power in that body with large States like Virginia and New York.

This great concession to the small States was counterbalanced by the provision that "money bills" should originate in the House of Representatives, where the people were represented according to numbers.

The clause relating to "money bills" was first introduced by Mr. Charles Pinckney, in his plan of a Federal Constitution; and afterward authoritatively introduced by Dr. Franklin in the committee which reported it.

Afterward, when, on motion of Mr. Mason, it was voted to postpone temporarily the clause relating to "money bills," in order to take up the clause relating to equality of votes in the Senate, Dr. Franklin said:

> That this question could not be properly put by itself, the committee having reported several propositions as mutual conditions of each other; he could not vote for it if separately taken, but should vote for the whole together.

Mr. Mason, of Virginia, agreed with Dr. Franklin, and suggested a reference to the committee, "that the whole might be brought into one view."

Mr. Mason, on another occasion, said:

> The consideration which weighed with the committee was that the first branch would be the immediate representatives of the people; the second would not. Should the latter have the power of giving away the people's money, they might soon forget the source whence they received it. We might soon have an aristocracy. * * * He was a friend to proportional representation in both branches; but supposed that some points must be yielded for the sake of accommodation. (Page 283.)

Dr. Franklin observed: * * * * "that it was always of importance that the people should know who had disposed of their money, and how it had been disposed of. It was a maxim that those who feel can best judge. This end would be best attained if money affairs were to be confined to the immediate representatives of the people." (Page 284.)

Mr. Mason said, in emphatic words:

> If the Senate can originate they will, in the recess of the legislative session, hatch their mischievous projects for their own purposes, and have their money bills "cut and dried" (to use a common phrase) for the meeting of the House of Representatives.

Mr. Gerry, in reply to Mr. Wilson, observed that he "would not say that the concession was a sufficient one on the part of the small States, but he could not but regard it in the light of a concession. It would make it a constitutional principle that the second branch were not possessed of the confidence of the people in *money matters*, which would lessen their weight and influence. * * * They would be deprived of the opportunity which their continuance in office three times as long as the first branch would give them of making three successive essays in favor of a particular point." (Page 283.)

Mr. Pinckney thought the concession wholly on the part of the large States, the privilege of originating money bills being of no account. (Page 283.)

On the report of the Committee of Eleven, we find these two propositions considered together as dependent.

Mr. Rutledge moved to reconsider both propositions.

Mr. Sherman "was for the question on the whole at once. It was," he said, "a conciliatory plan, * * and if any part should now be altered it would be necessary to go over the whole ground again."

Mr. Gerry said he "did not approve of a reconsideration of the clause relating to money bills. It was of great consequence. *It was the corner-stone of the accommodation.*"

Afterward, the clause in relation to money bills having been struck out,

Mr. Randolph moved to reconsider, and "called upon the smaller States to concur in the measure as the condition by which alone the compromise had entitled them to an equality in the Senate." (Page 410.) The clause was reconsidered, nine States voting in the affirmative; Maryland in the negative, and South Carolina divided.

Mr. Gerry again said he "considered this as a part of the plan that would be much scrutinized. Taxation and representation are strongly associated in the minds of the people, and they will not agree that any but their immediate representatives shall meddle with their purses. In short, the acceptance of the plan will inevitably fail if the Senate be not restrained from originating money bills."

In a subsequent report of the Committee of Eleven they provided, in the third clause of their report, that "all bills for raising revenue shall originate in the House of Representatives, and shall be subject to alterations and amendments by the Senate."

When this clause was reached, Mr. Gouverneur Morris moved to postpone its consideration, stating that "it had been agreed to in the committee on the ground of compromise, and he should feel himself at liberty to dissent from it, if, on the whole, he should not be satisfied with other parts to be settled." (Page 511.)

It was postponed until near the close of the great debate, when it was taken up; that portion relating to amendments was stricken out, and the words used in the constitution of Massachusetts were inserted, viz: "But the senate may propose or concur with amendments as in other bills," and the clause, thus amended, was passed—nine States voting in the affirmative, and only Delaware and Maryland voting in the negative.

Mr. Elliott, in his Notes, says "this provision passed in pursuance of a compromise," and says that "this explains the compromise alluded to by Mr. Gouverneur Morris. Colonel Mason, Mr. Gerry, and other members from large States set great value on this privilege of originating money bills. Of this the members from the small States, with some from the large States, who wished a high-mounted government, endeavored to avail themselves by making that privilege the price of arrangements in the Constitution favorable to the small States and to the elevation of the Government."

We have thus given a brief history of the first clause of the seventh section, and the compromises and adjustments which led to its insertion in the Constitution. A careful study of the debates will disclose that in all the discussions the words inserted were used as synonymous with the words "money bills," as used in the British constitution. It seems to us, therefore, that a fair interpretation of this clause, whether derived from the interpretation given to it by reason of its analogy to the British constitution, or from the debates of the convention, is, that all bills directly affecting the revenue shall originate in the House of Repre-

sentatives; or, as Mr. Webster declared, in debate upon this clause in 1833:

> This provision was taken from the practice of the British Parliament, whose usages were well known to the framers of the Constitution, with the modification, that the Senate might alter and amend money bills, which was denied by the House of Commons to that of Lords.

We shall now consider the practice of the Government under this clause, and in commencing assert that, with few exceptions, all the great financial measures necessary to carry on the Government, whether by means of taxation or appropriation, have originated in the House of Representatives.

It is curious to observe the analogies between our Government and that of Great Britain with reference to the subject of taxation and supply, with a view to a correct interpretation of the clause under consideration. One of the great reasons given by the Commons why the Lords should not meddle with money bills was, that the House of Lords was a perpetual hereditary body, whilst the Commons was an elective and a temporary body.

The Senate is a continuous and perpetual body, each one of its members holding through three successive Congresses, and the tenure of office of only one-third of the body expiring at any one period; whilst the House is subject to the direct will and voice of the people by the election every alternate year of the whole body of representatives. The practice of the English Commons was to have all tax bills considered by a committee called the Ways and Means, and all appropriations were considered by a committee on Supply. Analogous to this the first Congress that assembled provided a Committee of Ways and Means that should originate all revenue measures, whether of taxation or appropriation.

The same Congress also borrowed another rule from the Commons, that this class of bills should be first considered in committee of the whole House on a day fixed, so that free discussion should be permitted, and unlimited amendment allowed.

Under these rules the right to originate not only tax and tariff bills, but also appropriation bills, was conceded to the House of Representatives, until February 22, 1832, when Mr. Clay submitted certain resolutions in relation to the tariff, by which it was proposed to repeal the duties on all articles of importation not coming into competition with similar articles manufactured in the United States, except wines and silks, and to reduce the duties on these articles. These resolutions were referred to the Committee on Manufactures, which committee, on the 30th of March, made a long report, accompanied by a bill proposing an absolute repeal of certain duties, stating that, "to correct such parts of our laws as imposed unnecessary burdens, and to reduce or modify the duties in cases where it may be done without injury to our manufactures, is a subject of inquiry which will occupy the most serious attention of the committee. But a bill so reducing and modifying duties, if not subject to objections on constitutional grounds as a bill for raising revenue, which can only originate in the House of Representatives, will require much investigation, which the committee will bestow upon it with all the diligence which their other indispensable duties will permit."

This report led to a long debate on the constitutional power of the Senate to originate bills raising revenue, in which Mr. Dickerson asserted that, in his opinion, it was within the power of the Senate to repeal a duty, but not within the power of the Senate to reduce.

In reply to which Mr. Mangum said:

Sir, I mean not to discuss the constitutionality of originating in the Senate a revenue bill; yet I certainly was much struck with the novel view offered of the Senator from New Jersey, that the Senate might repeal *in toto* all duties on unprotected articles, but could not properly reduce duties on the other class. He doubts; he has scruples. He can abolish, but not reduce. Does not the Senator see that by abolishing duties on all unprotected articles he, in fact, increases the duties on the protected class; or, in other words, enhances the protection? As it is obvious to everybody else, I should do the Senator great injustice to suppose that it is not equally obvious to him. And besides, if there be any meaning in that part of the Constitution which requires that revenue bills shall be originated in the other branch of Congress, I suppose it to mean that the immediate representatives of the people shall be as well the judges of the proper objects of taxation as of the amount of the revenue. Indeed, the selection of the objects of taxation is not only the most undoubted, but, in fact, the most interesting power of the other House. But by the course proposed here, the Senate originates a bill not only striking out more than half the subjects of taxation heretofore adopted, but accumulates the whole revenue upon a few subjects, and in the selection of which the House, in the first instance, is not consulted.

Mr. Tazewell, in the course of the debate remarked: "Whence do you derive your power to originate a revenue bill? It was not to be found in the Constitution;" and entered into a full and luminous exposition of the constitutional question.

Then, on motion of Mr. Dallas, the bill was laid on the table.

The question again came up in the Senate in 1833, when, at a time of great political excitement, reaching almost to rebellion, Mr. Clay, with a patriotic purpose, brought forward in the Senate his compromise tariff bill to reduce existing rates of duty on imported articles.

The leading minds of the Senate revolted at what seemed to them an unconstitutional exercise of power, and the authority of the Senate under the clause now under consideration was debated by the ablest lawyers of that body.

In this debate Mr. Webster broke forth in language which clearly indicated the dangers which might result from an attempt to amplify the powers of the Senate, declaring that "the constitutional question must be regarded as important; but it was one which could not be settled by the Senate. It was purely a question of privilege, and the decision of it belonged alone to the House. The Senate, by the Constitution, could not originate bills for raising revenue. It was of no consequence," he said, "whether the rate of duty were increased or decreased;" and with singular accuracy, following the language of the framers of the Constitution, he said:

> If it was a money bill, it belonged to the House to originate it. In the House there was a Committee of Ways and Means organized expressly for such objects. There was no such committee in the Senate. The constitutional provision was taken from the practice of the British Parliament, whose usages were well known to the framers of the Constitution, with the modification that the Senate might alter and amend money bills, which was denied by the House of Commons to that of Lords. This subject belonged exclusively to the House of Representatives.

Other Senators took the same view. On the very introduction of the measure Mr. Forsyth objected "that the bill was a violation of the Constitution, because the Senate had no power to raise revenue. *Two years ago*, the same Senator made a proposition, which was rejected on this very ground." (Gales & Seaton's Reg., vol. 9, part 1, p. 473.)

Mr. Clay said, "The bill was not a bill to raise the duties, but to reduce them, and therefore did not come within the reach of an equitable objection. If it had been a bill to raise the rate of duties, the objection to it would have been a valid one. * * * * He did not believe that it was the intention of the Constitution so far to restrict the right of the Senate as to preclude the origination of a bill to repeal any existing law." (Ibid., p. 478.)

Mr. Dickerson said, "Whether the rate of duty was raised or lowered, the law was equally one for raising revenue within the Constitution. The distinction was an absurdity."

Mr. Silsbee said, he could not vote for the bill in the face of the Constitution, which expressly prohibited its originating in the Senate.

Mr. Frelinghuysen regarded the constitutional difficulty as altogether insuperable. Having taken a solemn oath to support the Constitution, he could not, however agreeable to his wishes, give his assent to a measure originating in the Senate, in violation of its express provision.

On the 25th of February, after a long and weary discussion, extending far into the night, Mr. Clay said:

Inasmuch as it was represented that the House of Representatives had just now passed a bill similar, if not identical, in its provisions to the one before the Senate; and it is believed it would, to-morrow, be presented to the Senate to sanction, it would obviate the reasons for a longer continuance of a laborious day's session of this body, and also supersede the objections of some Senators who believed the Senate was not the proper place for the origin of this bill. He therefore moved that the Senate adjourn.

The next day the Senate bill was ordered to lie on the table. And on the 27th the House bill was taken up in Committee of the Whole, and, on motion of Mr. Clay, reported to the Senate; Mr. Clay stating, in reply to an inquiry, that he believed it corresponded, word for word, with the Senate bill.

On Friday, March 1, the House bill was read a third time, and put on its passage, and passed, 29 to 16.

As a precedent this may be regarded as an abandonment, at that time, by the Senate of the power to originate, and the emphatic assertion of the power on the part of the House.

In 1837 the Senate passed a bill to authorize the issuing of Treasury notes, which was sent to the House, and the question of the power of the Senate being raised, it was decided, without the yeas and nays, to lay it aside and take up a House bill reported from the Committee of Ways and Means, having the same object, and the Senate bill was not again heard of. (House Journal of 1837, p. 212.)

The question again appeared in the Senate in 1844, Mr. McDuffie introducing a bill to revive the act of March 2, 1833, known as the compromise tariff act, and modify the existing duties upon foreign imports in conformity to its provisions; the effect of which would be to largely reduce the duties and rates of duty provided for by the tariff act of 1842.

The question of power, together with the bill, was referred to the Senate Committee on Finance, and on the 9th of January, 1844, was reported back to the Senate from that committee by Mr. Evans without amendment, accompanied with the following resolution:

Resolved, That the bill entitled "A bill to revive the act of the 2d of March, 1833, usually called the compromise act, and to modify existing duties upon foreign imports in conformity with its provisions," is a bill for raising revenue within the meaning of the seventh section of the first article of the Constitution, and cannot, therefore, originate in the Senate. Therefore, resolved, that it be indefinitely postponed.

These resolutions led to a long debate in the Senate, extending through a period of sixty days, upon their power to originate such a bill, during which the general subject was ably discussed.

Mr. Berrien quoted several motions of amendments in the debates of the convention, to show that such bills were always spoken of as money bills, including all revenue bills, the object of which was to raise money by taxation for revenue. Hence, he argued, there was no constitutional authority to originate this bill in the Senate. (Cong. Globe, vol. 13, p. 493.)

Mr. Benton said: "In all cases of doubtful jurisdiction between the two Houses, my rule is to solve the doubt in favor of the House, which, by the Constitution, is charged with the general subject. Taxation and representation go together. The burdens of the people and the representation of the people are put together. The immediate and full representation of the people is in the House of Representatives."

Mr. Benton, in this debate, avowed himself in favor of the principle of the McDuffie bill, so far as its effect would be to relieve the people of burdens imposed by the tariff act of 1842; yet he asserted that "the burdens of the people and the representation of the people are put together" in the House of Representatives, and "he would defer to the jurisdiction of the House, which is charged with the general subject."

After a full and protracted debate, the resolutions of the Senate Finance Committee were adopted with but four dissenting votes.

This question again came up in 1856, in a different form, and under peculiar circumstances of great political excitement. The House of Representatives did not elect a Speaker until the 6th day of February, so that no business was transacted in the mean time, the House being without committees. This contest, from day to day, made it quite apparent to the sagacious statesmen then in the Senate from the Southern States, that the political power of the House was about to pass from the men who had controlled it for many years; and, under a resolution proposed on the 11th of December, 1855, by Mr. Brodhead, "that the Committee on Finance be directed to inquire into the expediency of reporting the appropriation bills for the support of the Government, or adopting other measures with a view of obtaining more speedy action on said bills," it was sought to amplify the powers of the Senate, so as to bring within their original jurisdiction authority to originate the great appropriation bills necessary to carry on the Government; a power which, up to that time, had remained undisputed in the House of Representatives.

Mr. Brodhead, in explanation of this resolution, on the 7th of January, admitted in debate that, as to revenue bills, there was no doubt of the original right of the House. But the provision in the seventh section did not preclude the Senate from originating appropriation bills; and he argued, with great plausibility and force, that the delays on the part of the House rendered it impossible for the Senate to fairly and fully consider these bills after they came from the House. The resolution was then passed; and on the 4th of February, Mr. Hunter reported back, from the Committee on Finance, the following resolution:

> That the Committee on Finance be instructed to prepare and report such of the general appropriation bills as they may deem expedient.

Coupled with a statement that most likely an arrangement could be made with the House for a division of this labor, so as to expedite the business of the two Houses.

In the debate on this resolution, Mr. Seward, Mr. Sumner, and Mr. Wilson made able and conclusive arguments against the assumption of this power, claiming that, although within the strict letter of the Constitution, such exercise would be a violation of the spirit and intendment of the first clause of the seventh section of the first article.

Mr. Sumner said: "The proposition is a clear departure from usage, and on this account must be regarded with suspicion. A slight examination will demonstrate that it tends to the subversion of well established landmarks."

Mr. Seward said: "I think, then, sir, I stand upon the principle and the spirit of the Constitution of the United States in advising against the instruction which is asked for by the Committee on Finance."

Mr. Wilson said: "At this time, in the present position of affairs, I hope the Senate will make no change whatever; for if that change be made, it will be regarded by the country, whether it be so intended or not, as an attempt to increase the power and the influence of the Senate, which represents the States of the Union, at the expense of the House of Representatives, which represents equally the people of the country."

This resolution was adopted by the Senate, and, under it, two of the great appropriation bills were prepared and passed the Senate, of which the House took no notice whatever, but originated and passed the appropriation bills, and sent them to the Senate; thus adhering to the practice, which up to that time had been uniformly maintained, that of originating appropriation bills in the House.

The Senate conferees submitted a number of citations of laws originating in the Senate, which they claimed as precedents favoring the action of the Senate on the bill, which is the subject of the present difference.

The committee have carefully examined these precedents, and do not see in them any argument to sustain the Senate views. They seem to be, generally, bills intended to carry out, in good faith, treaty stipulations and commercial regulations arising under treaties with foreign countries. It is true that two of the acts cited reduced existing rates of duty, which reduction was acquiesced in by the House without raising the question of power. But it seems to your committee that one or two instances of waiver cannot be considered as a surrender, on the part of the House, of a great constitutional privilege.

PRECEDENTS. (See Statutes at Large.)

First. Vol. 3, p. 224, ch. 77. A bill repealing tonnage and other discriminating duties in favor of such nations as shall abolish discriminating duties; and is more in the nature of a treaty than an act.

Second. Vol. 3, p. 23, ch. 94.

An act providing police regulations for the collection of customs already provided for and in no sense levies taxes. It only provides penalties for the infringement of those police regulations.

Third. The citation, ib., p. 563, ch. 44, is an appropriation bill originating in the House. See House Journal, 3d session, 13th Cong., p. 668.

Fourth. Vol. 4, p. 154, ch. 26, is in the nature of a treaty, and provides for reciprocal duties with the republic of Colombia; and is in no sense a revenue bill.

Fifth. Ib., p. 308, ch. 11, is a similar provision relating to reciprocal duties with Prussia.

Sixth. Ib., p. 625, ch. 219, repeals the tonnage duties upon ships of the United States and also upon foreign vessels, when other countries shall abolish countervailing duties. So far as this abolishes duties upon the tonnage of ships and vessels of the United States, it possibly might be regarded as a revenue measure. But it would have been manifestly unjust to have retained this tonnage duties on American vessels when it was abolished as to all foreign vessels.

Seventh. Ib., p. 635, ch. 58, is an explanatory act, intended to apply to certain goods imported prior to a certain time, and which, under the act to which it is explanatory, would be obliged to pay a higher rate of duty than was provided by that act. The act is specific in its character, and cannot be regarded as altering or amending any existing rate of duty.

Eighth. Ib., p. 717, ch. 139, provided simply that all lead should be considered as in pigs, bars, and sheets, if it did not exceed twice the value of the raw material. This undoubtedly, to some extent, changed the rate of duty, but was explanatory only in its character.

Ninth. Ib., p. 778, ch. 44, seems to be a case in point, where the rates of duty upon certain articles might be changed if the law had not passed; but, in terms, seems to be a suspension of a law for a single session of Congress. It appears to be a further suspension of proviso to the tenth and eleventh clauses of the act July 14, 1832, which proviso relates to *ad valorems*.

Tenth. Vol. 5, p. 125, ch. 359, is an act to suspend the discriminating duties upon goods imported in vessels of Portugal, and to reduce the duties on wines one-half.

Eleventh. Ib., 61, ch. 233, is explanatory of an act which declared that iron prepared for railways or inclined planes should not be construed so as to include spikes, pins, or chains for railways.

Twelfth. Ib., p. 732, ch. 43, is an act to reduce the rates of postage, to limit the use and correct the abuse of the franking privilege, and for the prevention of frauds on the revenue of the Post Office Department.

Thirteenth. Vol. 11, p. 192, ch. 98, is a House bill. See House Journal, 34th Congress, 3d session, page 550, bill 566.

Fourteenth. Vol. 12, p. 313, ch. 46, is a loan bill, supplemental to the act of July 17, 1861, and merely relates to matters of detail, but does not provide for an increase of the public debt.

During the twenty-seventh Congress a bill to authorize the issue of five millions of Treasury notes passed the House of Representatives, with a proviso that the amount of such notes issued under the authority of this act should be deemed and taken in lieu of so much of the loan bill known as the twelve million loan act, the effect of which was not to increase the amount of the loan. The bill was sent to the Senate, where it was amended by striking out the proviso, the effect of which was to increase the loan to the extent of five millions. When the bill came back to the House, Mr. Roosevelt raised the question whether or not the Senate could make such an amendment to the bill without infringing upon the right of the House to originate money bills.

The Speaker decided that the point raised was a question of constitutional power between the two Houses, and was not a question of privilege, which, in his opinion, it was his duty to submit to the House. The decision of the chair was sustained. The House do not deny the power of the Senate to amend any particular bill relating to revenue, whether a loan bill, a tax bill, or an appropriation bill, which is all that was decided in this case.

There are instances where the House has acquiesced in the Senate bills merely for the purpose of facilitating legislation; as, for example, during the present Congress the Senate passed what was known as the funding bill or loan bill, and sent it to the House; where it was referred to the Committee of Ways and Means; but the committee considered and matured a bill of their own, which was reported to the House and passed. Immediately afterward the committee reported back the Senate bill, and moved the bill that had passed the House as a substitute, for the purpose of getting a ready conference upon the bill; thus, on the record, apparently acquiescing in the action of the Senate; but this could not be quoted as a precedent against the privilege of the House, because, for reasons of convenience, the question was not raised.

Nor can any of the examples cited by the Senate committee fairly be considered as an acquiescence on the part of the House of the power to originate this class of measures in the Senate, or a surrender of the privilege of the House.

The commentators upon this clause of the Constitution, so far as they have undertaken to interpret its meaning, we think, sustain your committee in their interpretation.

Mr. Justice Story, in discussing this clause, says, (Sec. 876 of Story on the Constitution:)

> That it is fit the House should possess the exclusive right to originate money bills, since it may be presumed to possess more ample means of local information, and it more directly represents the opinions, feelings, and wishes of the people; and being directly dependent on them for support, it will be more watchful and cautious in the imposition of taxes, than a body which emanates exclusively from the States in their political capacity.

Judge Tucker says: "Now, as the relation between taxation and representation in one branch of the legislature was fixed by an invariable standard, and as that branch of the legislature possesses the exclusive right of originating bills on the subject of revenue, the undue weight of the smaller States is guarded against effectually in the imposition of burdens." (1st Tucker's Blackstone, Appendix 195.)

Again, discussing the clause relating to the power of Congress to coin money, and regulate the value thereof, &c., he asserts that "every bill for this purpose, or for any other by which a revenue may be raised, should originate in the House of Representatives." Then, alluding to the fact that such a bill originated in the Senate, he says:

> The reason of the acquiescence of the House of Representatives on these occasions probably was, that no revenue was intended to be drawn to the Government by these laws; whereas, strictly speaking, a revenue is raised by the act establishing the mint. (Ibid., 261, 262.)

It is claimed on the part of the Senate committee that the term "raising revenue" in the Constitution relates to the imposition and not to the absolute remission of taxes. Your committee cannot conceive any good reason for such distinction.

On this point the action of the House of Commons furnishes us with an important precedent; and we are sustained in this view by full quotations, already cited, from Mr. Webster, Mr. Mangum, and other eminent constitutional lawyers.

In 1860 the House of Commons asserted its paramount authority both in the imposition and repeal of taxes. During that year the Commons determined to increase the property tax and stamp duties and repeal the duty on paper. This was done in two separate bills. The Lords assented to the increased taxation bill but rejected the paper duties repeal bill, and thus overruled the financial arangements(as Mr. May expresses it) voted by the Commons.

To meet the assumption on the part of the Lords, the Commons resolved:

> That to guard for the future against the undue exercise of the power of rejection by the Lords, and to secure to the Commons their rightful control over taxation and supply, this House has in its own hands the power so to impose and remit taxes and to frame bills of supply, that the right of the Commons as to the matter, manner, measure, and time may be maintained inviolate.

It is assumed that, because the bill under consideration is for the purpose of absolutely repealing a tax, the Senate has jurisdiction. But it seems to your committee clear that if the Senate can repeal one tax they can repeal another, and thus originate measures affecting the entire system of taxation. If, instead of repealing the income tax, the Senate had originated and passed a measure repealing all laws imposing duties on imports, it would at once become necessary for the House to originate another measure imposing taxes to make up for the deficiency created by this great loss of revenue. It seems to us plain that this would be an interference with the present system of taxation, and virtually the surrender of the power to originate tax measures according to the will of the House. The Secretary of the Treasury insists that he cannot spare the revenue now provided for by means of the tax on incomes without danger of a deficiency. Assuming this to be true, the House would be compelled at once to impose some new tax to counterbalance the loss whichwould ensue from this repeal.

It seems clear to your committee, therefore, that the only way to preserve, in its fullness, the power to originate bills for raising revenue, is to insist upon the right of the House to originate all bills relating directly to the revenue, whether imposing or remitting taxes; that the House should, in the first instance, be the judge of the manner, the measure, and the time of such impositions or remissions.

The same principles on which the House secured to itself the power to exclusively originate those measures of legislation imposing taxes, apply with equal force to the right to originate measures for a remission of taxes. They are so manifestly co-related that it seems wholly illog-

ical for the Senate to assume the right of the one, and at the same time acknowledge the constitutional restraint which prohibits the exercise of the other.

Mr. Mangum, in the Senate, stated this principle so clearly, and in language so plain, that we again repeat his words:

> If there be any meaning in that part of the Constitution which requires that revenue bills shall be originated in the other branch of Congress, I suppose it to mean that the immediate representatives of the people shall be as well the judges of the proper objects of taxation as of the amount of revenue. Indeed, the selection of the objects of taxation is not only the most undoubted, but in fact the most interesting power of the other House.

Then, alluding to the bill under consideration in the Senate, which was a bill absolutely repealing duties upon certain imported articles, he further says:

> But by the course proposed here, the Senate originates a bill not only striking out more than half the subjects of taxation heretofore adopted, but accumulates the whole revenue upon a few subjects, and, in the selection of which, the House in the first instance is not consulted.

Your committee think the assertion of the proper privileges of this House in relation to money bills important, in order to preserve that balance of power and influence which the framers of the Constitution intended should be maintained when the clause under consideration was inserted in that instrument, and therefore present, for the consideration of the House, the accompanying resolution:

Resolved, That this House maintains that it is its sole and exclusive privilege to originate all bills directly affecting the revenue, whether such bills be for the imposition, reduction, or repeal of taxes; and in the exercise of this privilege, in the first instance, to limit and appoint the ends, purposes, considerations, and limitations of such bills, whether relating to the matter, manner, measure, or time of their introduction; subject to the right of the Senate to "propose or concur with amendments, as in other bills."

41ST CONGRESS, 3d Session. } HOUSE OF REPRESENTATIVES. { REPORT No. 43.

NORMAN WIARD.

FEBRUARY 28, 1871.—Ordered to be printed.

Mr. A. COBB, from the Committee of Claims, made the following

REPORT.

[To accompany bill H. R. No. 1195.]

The Committee of Claims, to whom was referred the bill (H. R. 1195) for the relief of Norman Wiard, make the following report:

Norman Wiard presents a claim against the Government, growing out of certain contracts made with the Ordnance Bureau of the Navy Department.

Nearly all the claim as now presented was made the subject of a favorable report from the Ordnance Committee of the House of Representatives, offered by Mr. Schenck, March 2, 1869, accompanied by a bill, (awarding $125,848 49,) which passed the House the same day. (See Congressional Globe, 3d Sess. 40th Congress, Part III, p. 1815.)

But before the bill passed by the House was acted upon by the Senate, a "letter" was addressed to the President of the Senate by the Secretary of the Navy, on the 31st day of March, 1869, purporting to transmit all the documents on file in said Department relating to the contracts with Wiard, and among them a letter from the Chief of the Ordnance Bureau, alleging that Wiard did, in November, 1865, make final settlement of all claims against that Department, and give a receipt in full therefor.

It is therefore necessary to inquire, in advance, into the reasons of such alleged settlement.

An examination of the papers furnished by the Navy Department, in support of this allegation, shows that about the time last mentioned Mr. Wiard presented a bill to the Ordnance Bureau, amounting to $6,223 05, being mainly for metal used in an imperfect casting of a large gun; that Captain Wise appears to have cut down the bill to the sum of $4,085, which he admitted to be due upon that bill, but refused to pay the amount so admitted to be due, unless Mr. Wiard would agree to receive the same in "full and final settlement of all his claims, of whatsoever nature, against the Navy Department."

Mr. Wiard appears to have given a receipt in the terms required. But it also appears, from the documents accompanying the Secretary's letter, that he was urged by pressing want to apply to the Bureau for relief; and that with the above bill he sent a letter, in which he protested against the official construction of an agreement to which he was compelled unjustly to submit, and by reason of which the said bill was unwillingly presented to the Navy Department for settlement.

It is only necessary to make this brief statement of the circumstances.

under which the receipt was given, to show that it can have no effect beyond the particular bill to which it is appended.

We come, then, to a detailed statement of Mr. Wiard's claim.

I. 50-POUNDER GUNS.

First, as respects the date of agreement, is the claim for the price of certain 50-pounder rifle guns.

It appears that as early as August, 1861, Mr. Wiard was in correspondence with the Ordnance Bureau of the Navy Department in relation to the construction of large guns.

After several conferences with Mr. Wiard, and some offers on his part, the following letter was addressed to him:

BUREAU OF ORDNANCE AND HYDROGRAPHY, NAVY DEPARTMENT,
Washington City, August 1, 1861.

SIR: In answer to your proposals of yesterday's date, I have to inform you that the Bureau, being desirous of procuring rifle cannon for the use of the Navy at the shortest possible notice, will purchase guns of your fabrication of semi-steel; *provided*,

1. That the guns made shall conform strictly to the directions and drawings herewith presented.

2. If you will offer five guns made as above stipulated, the Bureau will receive them, subject to proper inspection, and, if accepted, pay you at the rate of eighty-five cents (85c.) per pound.

3. It is to be distinctly understood that the Bureau is to be the judge of your compliance with the conditions of the agreement, and binds itself to the purchase of no more than may be ordered from time to time.

You will please notify the Bureau if you accept the terms herein specified.

Very respectfully,

AND'W A. HARWOOD,
Chief of Bureau Ordnance and Hydrography.

Mr. NORMAN WIARD, *Washington, D. C.*

This offer was accepted. Mr. Wiard promptly set at work to manufacture guns under this agreement.

It is to be noticed that the kind of material out of which the guns were to be manufactured was agreed upon between the parties; and that the model of the guns, as well as all measurements and directions, were to be furnished by the Government.

A lot of five guns were forged under this agreement, and an order was given for another lot of five. But directly after giving the order for this last lot of five, the Bureau added the further requirement that this second lot was to be submitted to "proof." This kind of test was not within the terms of the original agreement, which only required "inspection," and might well have been objected to by Mr. Wiard. But he seems to have accepted this new condition. The first five were finished and inspected, and the work upon the guns appears to have been satisfactory to the inspector.

The Bureau, however, before acceptance, required the test of "proof." This requirement, as to the first lot of five, was clearly outside of the terms of agreement, and was, therefore, unjust. The Bureau had inserted into the agreement the right to refuse further guns at any time after the completion of any lot of five; and, therefore, the manufacturer incurred great risk in undertaking to furnish any guns under that agreement. Therefore, upon satisfactory "inspection" of the first five, he would have had a just claim for the price of all of them upon the Government, except for this reason: In consequence of the mistake of an employé, and without the knowledge or fault of Wiard, a new or false chamber was inserted in one of the guns, which, it is alleged, could not readily have been detected by the inspector, and which would have been

rejected by him had he known the fact. We think, therefore, that but four guns of the first five should be paid for.

As the second lot of five is not clearly proved to have been undertaken before the condition of "proof" was insisted upon by the Bureau, and apparently concurred in by Wiard, we are inclined to the opinion that he is not entitled to pay for such of the second lot of five as did not endure the "proof."

The usual proof, and the one actually applied in this case, was ten charges.

Under this test one of the last five burst.

Two of the first lot had also been disabled under the test of "proof."

And upon the bursting of the last gun tested, the Bureau refused to have anything to do with any more of the guns, denied that they had in fact formally received any but the first, or, as it was called, "the trial gun," and, though two more of the guns had stood the ten-charge proof, and four more of the last lot of five were finished, refused to pay for any but the first, or trial gun, which had stood the test of at least three hundred and fifty charges.

The reasons given by the Bureau for refusal of payment have been carefully considered, but they are not sufficient to justify its action.

That the second lot of five, as well as the first, were finished and offered for inspection is proved by the letters of Commander Hitchcock to the Ordnance Bureau. If they were not inspected, and were not "proved," it is not the fault of Mr. Wiard.

It would therefore seem that Mr. Wiard should receive pay for the first five, less the price of the first gun, which was paid for, and of the gun with the false chamber; and that he should receive pay for the second lot of five, less the one disabled by the "proof."

And taking the prices as agreed upon, and the average weight as ascertained by the weights of several of the guns given by the Ordnance Bureau, the amount stands thus:

Three guns, 5,518 pounds each, 16,554 pounds, at 85 cents	$14,170 90
Four guns, 5,518 pounds each, 22,072 pounds, at 80 cents	17,657 60
	31,828 50

The amount allowed by the report of the Ordnance Committee, (before referred to,) under this head, was $42,180. But the documents furnished by the Navy Department, after the date of that report, show the propriety of the reduction that is now made, though they do not affect otherwise the reasoning or the conclusions of that report.

II. 7½-INCH GUNS.

Next, in respect to the date of the contract, is the claim for damages, caused by the abrogation of an agreement for finishing certain "gun-blocks" into 7½-inch guns.

This contract was made, like the first, by correspondence between the parties, which is furnished in the communication before referred to, from the Secretary of the Navy.

It seems that in October, 1861, the Navy Department had made, or was about to make, provision for the casting of large blocks of metal for guns of different calibers; and that Mr. Wiard was applied to by the Ordnance Bureau to state the price for which he would finish those blocks into guns.

On the 28th of October he offered to do the work on the 7½-inch guns for $750 each; and the offer was accepted.

The bargain was consummated by the Chief of the Bureau of Ordnance, through the intervention of Commander Harwood.

Representations were made to Wiard that a large number of blocks were to be finished, as is shown by the letters of the Bureau, stating the sources from which they were to come, in addition to the assurances made directly to Wiard by the Bureau officials.

Wiard's only responsibility was in finishing the blocks, furnished by the Bureau, according to certain measurements, drawings, and directions, also to be furnished by the Bureau.

As the work of finishing such large masses of metal into guns could not be done in ordinary machine shops, and must of necessity require a great outlay, it was of importance to Mr. Wiard to understand how many guns would be required by Government.

No specified number was agreed upon, but it is evident that both parties contemplated large and long-continued employment for the works to be established by Mr. Wiard.

And in addition to the correspondence of the Bureau before referred to, Commander Hitchcock, who was specially authorized to make the agreement in this particular case, says, in a letter dated May 17, 1862:

> The 7½-inch guns which were put into Mr. Wiard's hands to finish, seven in number, were progressed with until the work was stopped by the Bureau. *The work was undertaken with the expectation that a sufficient number of guns would be put into their hands to compensate them for their expenditure upon machinery and fixtures.* The guns were in part completed; and as it was no fault of Mr. Wiard's that they were not entirely so, I think it but just he should be paid the price agreed upon, $750; and I doubt if that will give them any profit.

Under this agreement, and with these representations, Mr. Wiard undertook to finish these gun-blocks.

The work required the construction of large lathes, or boring-mills, and a rifling-machine, together with all other suitable tools. It also required the construction of a building for the special accommodation of these lathes and tools.

The work was commenced immediately. At the outset there were some obstacles that hindered its progress; but the delay was only temporary. No complaint was made, by the Bureau or the inspector, that the work was not pushed forward with reasonable dispatch. On the contrary, the correspondence published by the Bureau indicates, rather, that Mr. Wiard was himself delayed by the negligence of the Bureau in not seasonably furnishing drawings and directions.

Seven blocks were furnished by the Government. Four of these were finished, and three were in the process of being finished, when the work was stopped without the assignment of any cause whatever.

There is no pretense that Mr. Wiard's work did not fully meet every requirement.

The Department at that time, December, 1861, was in need of every gun it could procure.

Mr. Wiard took the material as furnished by Government, and made the guns exactly as required, according to the Dahlgren pattern.

There had been invested, as will be afterward seen, $26,000 in new lathes and tools fit for no other purpose.

No reason was given for suspending the work, and no offer made as compensation for the now useless outlay for buildings and machinery.

In the published correspondence there are letters of the inspector, which admit the inference that the work was abandoned because the

Bureau had become convinced that the material out of which the blocks were made was unsuitable.

And the affidavit of Mr. Plass, one of the persons engaged in the fabrication of the guns, states that Commander Hitchcock told him at the time the work was stopped, that the Bureau did not intend to give any further orders until the form of the gun was modified.

But whether the work was stopped for one reason or the other, in neither case was the contractor responsible. He is entitled, therefore, to compensation for the damages sustained by him, to the extent that such damage accrued by failure of the Government to meet its engagements.

Throwing aside all prospective gains and incidental losses, the sworn testimony of Mr. Plass, whose firm made the expenditure for the lathes and other tools, is as follows:

Three lathes, (combining turning and boring machines,) each $6,000.	$18,000
One rifling machine	3,000
Shop for lathes	5,000
	26,000

Which seems not an unreasonable estimate for works of such magnitude.

Mr. Plass testifies that the shop consisted of a large brick building of one story, with stone foundations for the lathes, built upon leased land, for which no compensation was allowed by the owner when given up a few months afterward; that the lathes and rifling machine were of no value for any other purpose; and that, in fact, the only amount received for them was their value as old metal—say about one cent per pound. He further testifies that no profit was realized upon the seven blocks finished, being the first product of the experiment, and necessarily attended with greater expense than those to be made afterward.

It does not seem proper to allow the whole cost of the extra building above mentioned, though it might, for the reason alleged, have been a bad investment for the contractor. Allowing, however, half its value, and estimating the value of the old metal at $500 dollars, the damages to be allowed under this head would be $23,000.

III. 15-INCH GUNS.

The claim in this branch of the case is founded upon an agreement hereto annexed, marked "A," made between Norman Wiard and Gideon Welles, Secretary of the Navy, dated April 10, 1863. The contract contemplated the fabrication of 15-inch guns in accordance with drawings and descriptions furnished by Mr. Wiard. The object of both parties was evidently, at the time it was made, to give satisfactory opportunity to test the qualities of a gun in the principle of which Mr. Wiard, the inventor, had great confidence. It must have been evident that the outlay for such fabrication would necessarily be large on the part of the manufacturer; and, as there was great need of safe guns at that time, and as the expense to the Government, in case of failure upon trial, was comparatively small, the contractor had the right to expect that, in any event, he would be entitled to an opportunity to test his invention, in so important a matter, to the fullest extent which a liberal construction of his agreement would allow. He seems, therefore, to have made large investments in good faith, and to have set about the work with great energy.

The contract provided for two trials of the gun. Mr. Wiard made an attempt and failed in the casting, merely producing a shapeless mass of

iron. He made a second attempt, in which he produced an apparently good casting, which he finished. But the gun burst upon trial.

He made a third attempt and finished a second gun, which he offered for inspection and proof.

The Ordnance Bureau refused to receive it and annulled the contract, upon the ground that he had exhausted all the opportunities given him under the contract; and that the Government would not proceed further in the experiment.

Mr. Wiard protested that he had had but one trial; that the first shapeless mass was not a gun within the meaning of the contract; that he had not asked, and did not ask pay for the metal in that imperfect casting, and presented the last gun as the second gun made under that contract; and that he only expected to receive pay for the metal in the last-named gun, which was in a condition to be fired and proved, instead of for that in the abortive casting that was useless for anything.

But the Bureau persisted in its refusal, and finally paid for the metal in the worthless casting, which it was impossible to put to any test, instead of the metal in the finished gun, which was waiting to be proved.

Without suggesting that under such circumstances, in the midst of a great war, and under a pressing necessity for safe guns, an inventor was entitled to great liberality in the construction of such an agreement, after making a very large investment, which could produce no possible return, except in case of success, it would seem that, upon the strictest construction of the terms of the agreement, Mr. Wiard had a right to have his second finished gun proved by the Ordnance Bureau according to his request.

And upon the refusal of the Bureau to accept the gun offered for inspection and proof and the consequent annulment of the contract, the Government is liable for the damages consequent upon the breach of the agreement.

In estimating these damages two views are suggested:

First. Inasmuch as the claimant made a large investment, which would be, of necessity, almost wholly lost in case the experiment failed, or in case the Government did not carry out its part of the agreement, and inasmuch as a strong inducement to such investment was not only the promise of the Department contained in the agreement under consideration, but also the encouragement held out by both the Navy and War Departments for the manufacture of an unlimited number of such guns, in case of success, it is therefore claimed that the contractor is entitled, the Bureau being in fault, to receive the amount proved to have been lost by such investment.

This is the view taken by the report of the Ordnance Committee before referred to. And they appear to have had satisfactory proof that the amount invested was $83,668 49. Deducting from this, however, the amount now proved to have been realized from the sale of machinery, tools, &c., after the work was stopped, (namely, $13,761 77,) and the actual loss is reduced to the sum of $69,906 72.

Another view is this: Mr. Wiard was working under an agreement, the provisions of which were specific and clear as to the number of guns which, in any event, the Government was required to take. That number was twenty. And in case of breach of contract, by the Government, the loss to the contractor must be confined to the profits which he would have made, had opportunity been given to fabricate the contract number. If those profits—as they must have proved to be in this case—should be only a small part of the expenditure necessary to

the production of the first guns, it is nevertheless all that could be expected under the contract. And though the contractor might have had—as he thinks he had reason to have—large expectations of business, and consequent profits, in case of success; yet, claiming damages as he does, under a particular contract, he must be satisfied with the rule of estimating damages which gives him only the amount of the probable profits that would have come to him from the number of guns which the Government had, in case of successful experiments, agreed to receive.

And this is the view which the committee, after careful consideration, is constrained to adopt.

The Navy Department did not undertake to indemnify the contractor for whatever might be the loss growing out of his expenditure. Like any other party, the Government should be held liable for the loss legitimately consequent upon the failure to fulfill its engagements. But it can properly be held to no further obligation.

The breach of the contract in this case did not grow out of that part of it which relates to the receiving of the twenty guns. But as the Department agreed that the proof of the second trial gun was to be, partly, at its own expense, and to be conducted, after inspection, by an ordnance officer; and as it was only after proof so conducted, and satisfactory to the Bureau, that any more guns would be ordered, or accepted even for proof; and as the Bureau definitely refused to make such inspection and proof of the second gun when offered, it is clear that any further attempt to execute the agreement on the part of the contractor would only result in useless expense.

The Department therefore caused as effectual a breach of agreement by refusal to inspect and prove the second gun as it could have done, at any future time, by refusal to receive guns after a satisfactory test.

The weight of each gun was to be 43,000 pounds, which, at 16 cents per pound, as agreed, would be $6,880. Twenty guns at $6,880 each, $137,600.

Under all the circumstances of the case, it is not unreasonable to estimate the probable profits at 20 per cent. upon the cost. amounting to $27,520, which is awarded as due, under this branch of the claim.

IV. The Frémont batteries.

In this case the claimant bases his claim upon a certain contract "made and entered into on the 23d day of September, 1861, between the United States, represented by Captain C. F. Callender, U. S. ordnance officer in command of the U. S. arsenal at St. Louis, Missouri, who was acting under the immediate orders of Major General John C. Frémont, commanding the Western Department."

The claim is stated thus:

The claimant was to receive for the first two batteries of 6 and 12-pounder guns the sum of $11,500 each	$23,000
And for the two batteries 12-pounder guns, the sum of $12,400 each	24,800
Aggregate	47,800
Less amount received from part of these guns and stores, sold for storage	9,360
Leaving a balance due the claimant	38,440

The contract thus alleged to have been made at St. Louis is not produced, nor any copy thereof. The reason for not producing the contract is, as testified by the only witness in the case, that he delivered it,

among other private papers of Mr. Wiard, to General Ripley, and was not able afterward to get it back.

The statement of its contents, by the witness produced to prove it, is indefinite and unsatisfactory.

The guns were never inspected, nor proved; it does not appear that they answered the material requirements of the contract, whatever they may have been; nor is it clearly shown what disposition was finally made of a large part of them.

But were the terms of the agreement, its performance by the claimant, and the amount of damages more clearly proved, there would yet remain the grave question whether damages should be allowed for breach of a contract made, under such circumstances, when not approved by the Ordnance Bureau, and when no beneficial result accrued to the Government. Upon that point, however, there is now no need to express an opinion.

For the reasons first assigned, the claim should be rejected.

V. STEAMERS AUGUSTA AND SAVANNAH.

This branch of Mr. Wiard's claim is stated thus:

Norman Wiard, at the instance of the Hon. Peter H. Watson, Assistant Secretary of War, constructed two iron-plated steam transports, called the Augusta and the Savannah. The steamers, after inspection, were approved.

A negotiation as to price of the steamers arose between Mr. Wiard and those representing the Government, and on the 3d November, 1864, Mr. Wiard submitted to General Meigs, Quartermaster General United States Army, a proposition to sell the Augusta for $80,000, delivered at Hampton Roads, Fort Monroe, or Norfolk; the payment to be made as follows: $50,000 on the receipt in New York of orders to despatch the steamer; $30,000 upon her safe arrival at her destination as above. That the risk of navigation and by fire should be borne thus: $50,000 by the Government, and $30,000 by Mr. Wiard; for which $30,000 he stated he would obtain insurance. Mr. Wiard also proposed to furnish the crew, coal, and stores at his own expense for the trip, but required return transportation for the captain and chief engineer. Mr. Wiard offered the Savannah on the same terms.

On 29th November, 1864, the Government, by Colonel George D. Wise, who was chief of Bureau of Ocean and Lake Transportation, accepted the offer of sale of the Augusta and Savannah, on condition that Mr. Wiard deliver them in good order at Hilton Head, South Carolina.

Mr. Wiard agreed to this proposition, provided the Government found the coal and fuel. (See memorial as to coal and fuel, sworn to by Wiard and O. M. Beach, page 9, letter of Colonel Wise, November 29, 1864.)

On the 8th of December, 1864, the Augusta was dispatched. On 10th December,-1864, Mr. Wiard applied for the $50,000, and on 15th December, 1864, Colonel Wise answered that "the Augusta is not considered the property of the Government until she arrives at Hilton Head, and is delivered in good order." (See memorial, page 8.)

The Augusta went ashore on Cape Henlopen, and was damaged.

Mr. Wiard's claim is for—

1. Five-eighths of what the insurance company charged for the repairs, being	$21,254 17
2. Interest on $100,000, being the first payment for the two steamers, from time it was to have been paid until paid	2,346 90
3. An extra pump on Augusta	600 00
4. Chains and sails retained by the officer at Hilton Head, (proven by memorial, page 19, sworn to by Wiard and O. M. Beach)	1,219 25
Total amount claimed	25,511 12

After a careful consideration of all the proofs and documents submitted in this part of the case, the committee have come to the conclusion that the Government only accepted the offers of the claimant for the sale of the vessels upon the modified terms of *delivery of the transports in good order at Hilton Head, South Carolina.* Therefore, the incidental costs of repairs, in transitu, and the interest charged, in the first

and second items, amounting to the sum of $23,001 07, in their judgment, form no just claim against the Government.

The Quartermaster's Department was responsible for nothing, having supplied the vessels with coal and fuel, according to the modified terms of the claimant's agreement, until the same should be delivered in good order at Hilton Head.

But, for the safety of these vessels on a winter voyage, the extra steam-pump, chains, and sails, charged in the third and fourth items, amounting to the sum of $1,819 25, were supplied by the claimant, and as those articles formed no part of the regular equipment of the transports, and were not returned nor accounted for to the claimant, he is entitled, in the opinion of the committee, to be reimbursed therefor. Every portion of this claim, except the three items of steam-pump, chains, and sails, is without equity; and, in the opinion of the committee, deserves no further consideration by Congress.

It is therefore recommended that relief be granted to the extent of $1,819 25, and no more.

VI. THE STEAMERS FOSTER, RENO, BURNSIDE, AND PARKE.

The above steamers were sold to the Government, for a certain price, after being inspected and approved by the proper Government officers; which price was duly paid.

The claim now presented is for the amount of $58,210 77 for the expenses of labor, new boilers, machinery, and alterations, made by order of Major General Butler upon said steamers, after they were so inspected and accepted.

The items of the claim are thus stated:

For furnishing each of the four steamers with a hog-frame at a cost of $2,450 each	$9,800 00
For the Foster, in repairing the damages sustained by running upon a sunken stump	2,304 55
Paid Hayen & Co., Baltimore, cash for new copper sheathing	1,381 32
Three new boilers for the Foster	6,200 00
Two new air-pumps	780 00
Two new evaporators	825 00
One new blower, (Dimpfel patent,) set up	380 00
New pipes, valves, and connections	400 00
One new blowing engine, set up	500 00
New breaching for boilers	360 00
Pipes and dampers for blowers	180 00
	23,710 77

Burnside boilers	$8,250 00
Blower and engine	880 00
Sheet-iron work	540 00
Felting	130 00
Setting up boilers, removing decks, new combings, &c	1,300 00
Pipes and fittings	400 00
	11,500 00
The Reno same as the Burnside	11,500 00
The Parke same as the Burnside	11,500 00
Foster	23,710 77
Total	58,210 77

The documents furnished by the Quartermaster General's office clearly sustain the allegation that the items thus stated are entirely outside the requirements of the agreement of purchase; and the testimony tends to show that the alterations and additions were made under the direction of

Major Van Vliet, quartermaster, Mr. Haswell, engineer, and General Graham, at New York, and of Major General Butler at Norfolk.

It does not appear, however, that this work had the formal approval of the Bureau at Washington, and it is alleged that the lack of such approval has heretofore stood in the way of an adjustment of this claim at the War Department.

That a large expenditure was made upon these steamers after they were accepted by the Government; that it was made by Mr. Wiard, under the direction of Government officers; and that it must have been made with the full knowledge of the Bureau, seems not to admit of a doubt.

And, inasmuch as the alterations were ordered by an officer in the field high in command, for whose use the steamers were intended, and inasmuch as the Government received the benefit of the expenditure, there seems to be no good reason why it should not pay whatever may have been proved to have been so expended.

The whole amount claimed is, however, not satisfactorily proved.

There is no sufficient proof of the second and third items, amounting to $3,685 87. Nor is it clearly shown that there should be an allowance for the value of the boilers furnished, as charged, for the Burnside, Reno and Parke.

It is left in doubt by the testimony whether the original boilers were merely altered and reset in a different position, or whether, if supplanted by new ones, they were not in a condition for further service; and, therefore, of considerable value to the claimant.

Under this state of the evidence it does not seem proper to allow the price of these boilers, amounting to $24,750. The other items appear satisfactorily proved.

Making the above deduction, the result is this:

Whole claim		$58,210 77
Deduct—		
Second and third items	$3,685 87	
Three sets boilers	24,750 00	
		28,435 87
		29,774 90

Leaving $29,774 90 as the sum due for said expenditure.

SUMMARY.

I. Amount allowed under the 50-pounder gun contract	$31,828 50
II. Amount allowed under the 7½-inch gun contract	23,000 00
III. Amount allowed under the 15-inch gun contract	27,520 00
IV. Amount allowed under the Fremont-battery contract	
V. Amount allowed on account of steamers Augusta and Savannah	1,819 25
VI. Amount allowed on account of steamers Foster, Burnside, Reno, and Parke	29,774 90
Total	113,942 65

In view of the premises and considerations set forth, the committee report back the bill providing for the appropriation of $113,942 65 in full payment for all work and labor done, materials furnished and supplied to, and for all damages and losses sustained by breaches of contracts with, and on the part of, the United States, during the war and hitherto, and recommend its passage by the House.

A.

Contract between Secretary Welles and Norman Wiard in relation to 15-*inch guns.*

This contract, made and entered into this 10th day of April, 1863, between the Honorable Gideon Welles, Secretary of the Navy, acting for and in behalf of the United States of America, of the first part, and Norman Wiard, of the city and State of New York, as principal, of the second part, witnesseth: That, for and in consideration of the stipulations hereinafter mentioned, the said party of the second part agrees:

1. To cast, finish, and prepare for proof, and furnish a suitable place and means for mounting and proving, a trial smooth-bore gun of 15-inch caliber, modeled upon the plan heretofore presented, to weigh 43,000 pounds, to be in length of the dimensions of the Navy 15-inch guns mounted in the turret vessels.

2. The finished castings shall be free of all defects or cavities on the exterior or interior for which the naval service guns would be rejected; the bore shall be within the regulation limits, and the preponderance as established by the regulations of the Navy Department.

3. During the fabrication, (of the time of the commencement of which the Navy Department shall be informed,) the officer who may be appointed to examine and superintend, on the part of the Government, the progress of the work, shall be afforded all necessary facilities to ascertain all the details of molding, casting, qualities and kinds of iron and fuel used, arrangement of the pit and flasks, and everything bearing on the peculiarities of this method of casting guns.

4. When the gun is completed, and reported ready for proof by said party of the second part, one-half the value of said gun completed, at 25 cents per pound, shall be paid, or caused to be paid, by the said party of the first part; and as soon thereafter as may be convenient it shall be subjected to the following proof: one charge of 80 pounds of No. 7 quickest-burning powder, (Hazard's or Dupont's,) and two solid shot, with the usual windage, to be cast in pairs in this form,* and to weigh together 900 pounds, and to have flattened ends, that they may not crush in the gun. Then 20 charges of 60 pounds of the same powder and one shell ef 330 pounds weight to each charge, to be fired with the greatest possible rapidity.

5. If the gun stands the proof without other injuries than those allowed by regulation, it is to be immediately accepted by the Navy Department, and paid for at the rate of 25 cents per pound, less the amount which may have been advanced under the provisions of article 4; and the said party of the first part agrees to forthwith give the said party of the second part an order for 20 guns, formed upon the same plan, of such calibers as may be required by the exigencies of the naval service, of not less than 10 inches caliber, made of the same iron, in the same manner as the trial gun, but not more than two calibers shall be required; which guns said party of the second part agrees to furnish at 16 cents per pound.

The guns shall be finished in a workmanlike manner; the variations in dimensions of the finished guns shall not exceed those allowed in service guns, and they are to be subjected to the same proof as guns of like caliber in the naval service.

6. If the first or trial gun should fail to stand this test from any defect of fabrication, the said party of the second part shall be permitted to cast a second trial gun, subject to the same conditions and tests as the first gun, which, if it proves successful, shall be taken as the trial and model gun. In the manufacture of this gun the fragments of the first one may be used by the said party of the second part. If the second trial gun should also fail, this contract is to be void and of no effect, and the rejected gun or guns and their fragments shall become the property of the Government.

7. The first gun shall be ready for trial within two months of the date hereof, and should this gun fail, the second trial gun shall be ready within one month after the date of the failure of the first one.

8. The date of the delivery of the 20 guns provided for in article 5, should they be ordered, will be determined by an agreement to be made between the contracting parties. The conditions of payment for the 20 guns aforesaid to be those usual in contracts made by the Navy Department for ordnance, viz: "No other charge to be admitted nor allowances to be made by the United States for or on account of this contract, and *twenty* per centum to be withheld from the amount of all payments due on account thereof as collateral security, and not in any event to be paid except by special authority of the Secretary of the Navy until it is in all respects complied with by the parties, and *eighty* per centum of the amount of all deliveries will be paid by the Navy Department within 30 days after bills duly authenticated shall have been presented to him.

And the said party of the second part does further engage and contract that no member of Congress, officer of the Navy, or other person holding any office or appoint-

---

* See drawing, printed evidence, page 10.

ment under the Navy Department, shall be admitted to any share or part of this contract or agreement, or to any benefit to arise thereupon.

And it is hereby expressly provided, and this contract is upon this express condition, that if any such member of Congress, officer of the Navy, or other person above named, shall be admitted to any share or part of this contract, or to any benefit to arise under it, or in case the party of the second part shall in any respect fail to perform this contract on his part, the same may be, at the option of the United States, declared null and void, without affecting their right to recover for defaults which may have occurred.

It is further stipulated and agreed that if default shall be made by the party of the second part in delivering all or any of the 20 guns, if they should be ordered, at the times and places which may be provided, that then and in that case the said party will forfeit and pay to the United States, as liquidated damages, a sum of money equal to twice the amount of the contract price herein agreed upon as the price to be paid in case of the actual delivery thereof; which liquidated damages may be recovered from time to time as they accrue.

In testimony whereof the parties of the first and second parts have hereunto set their hands and affixed their seals, at the city of Washington, the 10th day of April, 1863.

NORMAN WIARD.
GIDEON WELLES.

Further, in reference to section 8, above, it is hereby agreed and determined by the contracting parties that the dates of the delivery of the 20 guns provided for in article 5, should they be ordered, shall be as follows:

One gun per week after the success of the trial gun or guns.

NORMAN WIARD.
GIDEON WELLES.

41ST CONGRESS, 3d Session. | HOUSE OF REPRESENTATIVES. | REPORT No. 44.

LOGAN H. ROOTS.

FEBRUARY 28, 1871.—Ordered to be printed.

Mr. A. COBB, from the Committee of Claims, made the following

REPORT.

[To accompany bill H. R. No. 3071.]

The Committee of Claims, to whom was referred the memorial of Logan H. Roots, having considered the same, report:

That claimant was collector of internal revenue for the first district of Arkansas, from July 1, 1867, to June 24, 1868, previous to which the polity and civil service of the country in that State had fallen into an embarrassed and demoralized condition.

This unsettled condition rendered it difficult to procure responsible and efficient deputy collectors; yet the claimant succeeded in administering his duties with such zeal as to be greatly to the advantage of the revenue department.

The total assessments against his district for the period amounted to $569,827 03, all of which was finally collected, paid over, and accounted for according to law, excepting $3,281 21.

This deficit was the result of the defalcation of one Hugh McMurray, a deputy collector, of whom an apparently sufficient bond and security were taken, and which bond being prosecuted in the law courts has been avoided by some of the defendants on the plea of *non est factum*, and become unavailable by the bankruptcy of others.

In this result it does not appear that there was fault or negligence on the part of the claimant. He seems to have done all that he could, first and last, to protect the Government. Every legal method has been exhausted to secure the amount due from the deputy and his sureties without avail. The deficit remains, an amount still beyond the means of the claimant, and his memorial appeals to Congress for equitable relief.

The committee, considering the relations of the claimant to the House, have viewed this claim narrowly; but after a thorough examination have concluded that the peculiar circumstances of the case warrant them in recommending to the House that the relief prayed for be granted; and for that purpose report the accompanying bill.

41ST CONGRESS, 3d Session. } HOUSE OF REPRESENTATIVES. { REPORT No. 45.

NATIONAL ASYLUM.

MARCH 2, 1871.—Ordered to be printed and recommitted to the Committee on Military Affairs.

Mr. NEGLEY, from the Committee on Military Affairs, made the following

REPORT.

The Committee on Military Affairs, who were directed by resolution of the House of June 5, 1870, to investigate the management of the National Asylum for disabled volunteer soldiers, respectfully submit the following report:

The committee have examined the acts incorporating the asylum and providing for its support, have ascertained the amount of money received and expended, have made careful inquiry into the method of keeping accounts and vouchers and of making disbursements, and have, by a sub-committee, visited three of the four branches of the asylum, to satisfy themselves by personal observation of the fidelity and efficiency of the management of these institutions.

The first act of Congress incorporating the asylum was passed in 1865, and provided for a board of one hundred managers, a majority of whom was necessary to constitute a quorum for the transaction of business. Several attempts were made to get a quorum to attend a meeting, but without success, and no organization was effected until after the passage of an amendatory act approved March 21, 1866, which provided that "the board of managers shall be composed of the President, and Secretary of War, and Chief Justice of the United States, *ex officio*, during their terms of office, together with nine other citizens of the United States, not members of Congress, no two of whom shall be residents of the same State, but who shall all be residents of States which furnished organized bodies of soldiers to aid in the late war for the suppression of the rebellion, (no person being ever eligible who gave aid or countenance to the rebellion,) to be selected by joint resolution of the Senate and House of Representatives."

The members of the board hold their office for six years. The terms of office of two members expire every year, and their places are filled by joint resolution of the two Houses. The object of the asylum, as specified in the law, is for the care and relief of the disabled volunteer soldiers of the United States Army. The following gentlemen were first chosen members of the board of managers: Richard J. Oglesby, of Illinois; Benjamin F. Butler, of Massachusetts; Frederick Smyth, of New Hampshire; Lewis B. Gunckel, of Ohio; Jay Cooke, of Pennsylvania; P. Joseph Osterhaus, of Missouri; John H. Martindale, of New York; Horatio G. Stebbins, of California; and George H. Walker, of Wisconsin. The board is at present constituted as follows: The President of the United States, the Chief Justice, the Secretary of War, *ex officio;*

Major General B. F. Butler, president, Lowell, Massachusetts; Major General J. H. Martindale, senior vice-president, Rochester, New York; Jay Cooke, esq., junior vice-president, Philadelphia, Pennsylvania; Hon. Lewis B. Gunkel, secretary, Dayton, Ohio; General Thomas Osborn, Chicago, Illinois; Governor Frederick Smyth, Manchester, New Hampshire; Dr. Erastus B. Wolcott, Milwaukee, Wisconsin; Major General John S. Cavender, St. Louis, Missouri; Hon. Hugh L. Bond, Baltimore, Maryland.

By the laws of Congress there is appropriated for the support of the National Asylum as follows:

> All stoppages or fines adjudged against such officers and soldiers by sentence of court-martial or military commission over and above the amounts necessary for the reimbursement of the Government or of individuals; all forfeitures on account of desertion from the service; and all moneys due such deceased officers and soldiers which now are, or may be, unclaimed for three years after the death of such officers and soldiers, to be repaid upon the demand of the heirs or legal representatives of such deceased officers or soldiers. And the said board of managers are hereby authorized to receive all donations of money or property made by any person or persons for the benefit of the asylum, and to hold or dispose of the same for its sole and exclusive use.

It is evident that the amount of this fund can never be finally fixed until all the soldiers' accounts during the war of the rebellion have been settled through the Second Auditor's office. On the first of each month, therefore, an account is made up of the amount of such fines, stoppages, and other moneys as is provided by this section at the Second Auditor's office; and upon the account being stated and approved by the Comptroller, a requisition is made by the War Department, and a warrant is issued at the Treasury payable to the National Asylum, the check of which is delivered to the treasurer of the same. At each quarterly meeting of the board of managers, estimates having been previously made by the governors of the several asylums of the amounts needed for the use of their branches for the ensuing three months, are examined by the board and passed upon, and a resolution of appropriation is carried, each of which has been submitted to Congress in the several annual reports. The treasurer of the board of managers is then expected to pay out the moneys received from time to time, as required according to these resolutions of appropriation.

If, as has been sometimes the case, (*vide* the certificate of the Treasurer of the United States annexed to this report, Appendix A,) larger amounts come into the hands of the treasurer of the board than necessary for current expenses, such excess is at once invested in United States bonds. When such investment is made the bonds thus purchased cannot be sold or the investment disbursed without a direct resolution of the board of managers. All amounts so invested will appear in the certificate hereto annexed. By a standing resolution of the board no investment is allowed to be made in any other species of security than that of United States bonds.

Committees of the said board are appointed each year to audit the accounts of the several branches of the asylum, and also the accounts of the treasurer of the board, and to investigate whether they are properly vouched for, and to report to the board of managers, all of which is reported to Congress.

Before such a committee, at their examination of the central branch of the institution, at Dayton, Ohio, the treasurer of the board exhibited his account, Appendix B, and a certified statement, Appendix C, from the United States Treasury, which is hereto appended, with a letter, Appendix D, from the United States Treasurer, General F. E. Spinner. This account contained all amounts which the treasurer of the board ever

had received, as well as his vouchers for expenditures as they were made from time to time, according to the authorization of the board, all of which were found by the committee correct, and by request of the treasurer of the board the committee appended to his report, in book form, the annexed certificate, Appendix E:

MILWAUKEE, WISCONSIN, *October* 28, 1870.

The account contained in the foregoing pages, from 2 to 19 inclusive, (printed report, Appendix E,) were examined by us, members of the Military Committee of the House of Representatives, charged by resolution with the investigation, and the items of the credit side of the account were compared with a certificate from F. E. Spinner, Treasurer of the United States, of all the moneys which stood charged on the books of the treasurer of the National Asylum, and found to be correct. The debtor side of the account was found to be properly vouched in each item.

JAS. S. NEGLEY,
Chairman of Committee.
JASPER PACKARD

The footings of this account are as follows:

Cash received by the treasurer.....	$4,503,410 00
Cash paid by the treasurer.....	4,407,462 04
	95,947 96

In explanation of this very considerable sum found to be in the said treasurer's hands, he explained that the board of managers were about completing the purchase of the home at Hampton, for which the money had been appropriated, as well as for the refitting of the same, which combined accounted for $75,000 of that amount, and the committee are informed that this sum has since been paid out.

A discrepancy will be observed between the balance of the footings of the treasurer of the board and the amounts which have been received by him from the United States Treasury. This comes from the fact that the said treasurer accounted for large amounts received by him from private donations, summing up to the exact difference.

It appears that there now stands invested to the credit of the asylum, in bonds of the United States, the sum of $1,415,000. What the sum accumulating from forfeitures by desertion and other sources will be, and what will remain for the use of the asylum, is impossible to say; but it is believed that the amount will be sufficient to support the asylum in the future, after the purchase of lands, buildings, and construction shall have been completed.

Attention is called to the analysis of the treasurer's account, the investment account, and the quarterly appropriations of the board of managers, by which the quarterly balance in the hands of the treasurer of the board will appear, if there is such. But sometimes, owing to delays in adjusting accounts in the Second Auditor's office or to the neglect to pass the accounts and requisitions through the United States Treasury, the treasurer of the board has been called upon to advance very considerable sums for the current expenses and construction, which in every case has been done without any charge of interest. At the same time the said treasurer has not credited the institution with interest on the balances of appropriations from quarter to quarter remaining in his hands, on the grounds that they were moneys at call, and had to be sent to widely diverse parts of the country to be expended, viz: Augusta, Maine; Milwaukee, Wisconsin; Dayton, Ohio; and Hampton, Virginia. All this transmittal of these very large amounts has been made without cost or loss to the institution.

The treasurer of the board states that, being a bonded officer in the sum of $100,000, and being obliged to transmit large sums to be used in many different places; also because, after the first three quarters of 1867, the exact amounts of the appropriations could not be obtained from the United States Treasury except partially from month to month, and irregularly, in sums varying greatly in amount, he has charged himself, for convenience sake, with the amount appropriated at each meeting of the board of managers, depositing the money received with his private account, and paying out the same on his own drafts, irrespective of the fact whether the money appropriated was actually received by him from the United States Treasury or not; so that at several times, as appears by the accounts, the asylum has been indebted to the treasurer of the board in very considerable sums. As an example of one of these instances, on the 1st day of January last the said treasurer appears by the accounts to have advanced to the asylum the sum of $111,232 11.

The general conclusion of the committee with regard to the financial management of the asylum is that the funds of the institution have been judiciously expended, and that as great economy has been practiced as was consistent with a proper regard for the comfort and happiness of the men for whose benefit the asylum was established. Liberal expenditures have been made to provide chapels, libraries, reading-rooms, amusement-halls, and other facilities for recreation and for intellectual and moral culture, as well as to furnish good quarters, food, clothing, and hospital attendance, but the committee regard such expenditures as wisely made, in view of the fact that the constant and proper aim of the management is to prove to the disabled soldiers that the asylums were in no sense almshouses, furnishing them with the bare necessaries of life, but homes which they have earned for themselves by their sufferings and sacrifices.

The members of the board have taken a constant and active interest in the asylum; they receive no pay for their services, the law allowing them only their actual expenses. Their action is therefore separated from any interested personal motives. The committee believe that the board have acted under a sense of the responsibility conferred upon them, and have administered their trust with a proper appreciation of its magnitude and character.

The following statement, prepared by the secretary of the board of managers, gives a full account of the operations of the asylum for the year ending December 1, 1870:

Whole number of disabled soldiers and sailors supported or cared for by the board of managers during the year:

At Central Asylum, near Dayton, Ohio	2,101	
At Eastern Branch, near Augusta, Maine	719	
At Northwestern Branch, near Milwaukee, Wisconsin	798	
At Philadelphia Soldiers' Home, Philadelphia, Pennsylvania	451	
Out-door relief	125	
		4,194
Whole number supported or aided during the year ending November 1, 1869	3,802	
Increase over last year	392	

HOW DISABLED.

Of these so aided, so far as reported, 8 lost both arms. 5 both legs, 2 each an arm and a leg, 309 each one arm, 388 each one leg, and 1,245 were disabled by other wounds received in the service; 113 were blind, the most of them totally, and 48 insane, made so, in most cases, by the cruelties to which they were subjected in rebel prisons. The remainder were disabled by sickness contracted in the service, as shown by the

NUMBER TREATED IN HOSPITAL,

which, during the year, was 1,667, and for the diseases following: consumption, 217; rheumatism, (acute and chronic,) 182; diarrhea and dysentery, 126; paralysis, 71; ulcers and old gun-shot wounds, 165; chronic bronchitis, 57; asthma, 24; epilepsy, 16; ophthalmia and other diseases of the eye, 28; diseases of the heart, 35; diseases of the ear, 13; dyspepsia, &c., 33; miasmatic diseases, 67; hernia, 27; chronic inflammation of the liver, 13; diseases of the urinary and genital organs, 83; diseases of the bones and joints, 22; other chronic diseases, 156; other acute diseases, 161; &c., &c.

AGES, NATIVITY, DOMESTIC RELATIONS, ETC.

Of these, cared for at the regular asylums, 59 were under the age of 20; 1,502 between the ages of 20 and 30; 1,651 between the ages of 30 and 50; and 406 over the age of 50. Of the whole, 1,065 were married, with wives or minor children still living, and 2,553 unmarried; 1,455 were native born, and 2,163 of foreign birth; 151 belonged to the Regular Army, 37 to the Navy, and 3,413 to the volunteer service.

PENSIONS AND PENSIONERS.

Of the 3,618 supported at the regular asylums, only 893 received pensions, but they received during the year the sum of $125,489 94. Out of this they pay for their clothing, at the cost price of the same to the asylum, and transportation at half the usual rates when they choose to visit their families and friends. Out of the remainder, and other moneys received from the asylum, many disabled soldiers support their families at home, while others leave their moneys in trust and at interest with the treasurer until a sufficient sum is accumulated to enable them to go into business and earn a living for themselves.

EMPLOYMENT AND COMPENSATION.

Under the order of the board, all the service and labor required in and about the asylum (with a few rare exceptions) is now performed by disabled soldiers, for which, as a rule, they receive compensation ranging from $5 to $25 per month. During the year there were so employed, at Central Asylum, 366 inmates, who received $32,617 19; Eastern Branch, 200 inmates, who received $22,723 29; Northwestern Braneh, 97 inmates, who received $11,195 01; being a total of 663 disabled soldiers so employed during the year, who received from the asylum the sum of $66,535 49.

WORKSHOPS

have been established at each asylum, and are now in successful operation. The trades carried on are shoe-making, cigar-making, plumbing, gas-fitting, printing, book-binding, cabinet-making, wagon-making, blacksmithing, harness-making, basket and broom-making, painting, tinning, and knitting with machines. At Central Asylum 109 inmates were so employed, and their labor produced the sum of $30,672 67, and after deducting cost of raw material, the sum of $20,758 82 was left as profit of same. At the Eastern Branch a shoe manufactory, with the most improved machinery, is now in successful operation. During the five months that it has been carried on 14,940 pairs of shoes have been made, for which there has been paid to inmates as their share of the labor the sum of $2,008 85.

FARMS AND GARDENS

are cultivated at each asylum by the labor of disabled soldiers, and there was realized from these sources, during the year, the following sums:

At Central, the sum of	$9,728 70
At Eastern, the sum of	9,148 60
At Northwestern, the sum of	10,420 08
Making a total of	29,297 38

realized by the asylum from these sources during the year.

LIBRARIES AND READING-ROOMS

have become an interesting and important feature at each asylum. The larger part of the books have been donated by kind friends, and the remainder purchased from the profits realized in the asylum stores. The libraries are now as follows: Central, 3,264 volumes; number of books taken out and read during year, 13,853; Eastern, 2,138 volumes; number of books taken out and read during year, 5,725; Northwestern, 1,500 volumes; number of books taken out and read during year, 4,990; making total

number of volumes 6,902, and total number of books taken out and read during the year, 24,568.

The reading rooms are regularly supplied (and almost entirely by donation from the publishers) with the following newspapers and periodicals: Central, 30 dailies, 226 weeklies, and 80 periodicals; Eastern, 29 dailies, 149 weeklies, and 22 periodicals; Northwestern, 10 dailies, 48 weeklies, and 11 periodicals. These rooms are crowded day and night, and the English, German, and French newspapers and periodicals read with the greatest possible interest.

SCHOOLS

have been established at each asylum, and are doing much good in preparing disabled soldiers to go back into the world, and as school-teachers, book-keepers, clerks, telegraph operators, &c., to earn their own living. The branches taught have been reading, writing, arithmetic, geography, English grammar, algebra, history, Latin, telegraphy, book-keeping, and music. The attendance during the year has been as follows:

Central, 272 scholars; Eastern, 50 scholars; Northwestern, 76 scholars; total, 398.

AMUSEMENTS.

Believing play as necessary as work, and both conducive to the health and happiness of the men, the managers have made liberal provision for amusements at each of the asylums. Large assembly rooms for lectures, concerts, dramatic entertainments, &c., have been provided at each asylum, and the reports show that they are very frequently occupied and always crowded. Brass bands, string bands, glee clubs, dramatic clubs, debating clubs, &c., formed among the inmates, give frequent entertainments, while the asylums are also frequently visited by amateur musical clubs from the neighboring cities, and by traveling lecturers and concert troupes. Besides, at each asylum there are amusement halls, where there are ten-pin alleys, billiard and bagatelle tables, and other means for in-door amusements.

RELIGION AND MORALS.

At the Central asylum a fine stone church edifice has just been completed. Comfortable and pleasant chapels have been provided at the two other asylums. Religious services are held by the chaplain every Sabbath morning and evening, and seem to be generally well attended. The regular attendance at the Central is reported at 400, and is on the increase. Special services are held in the hospitals every Sunday afternoon. English and German Catholic priests also visit the asylums and hold regular services. Besides, there are Bible-classes, Sunday-schools, prayer-meetings, Christian associations, &c.; also, lodges of the Good Templars and other temperance organizations, some of them with a membership of over 200. Through these and the other influences above named, a wonderful change in the morals and conduct of the men has been accomplished. One of the reports says, "These things have had a most happy and benificent influence on our men. They are now orderly and well behaved, and seem contented and happy. Discipline is now so easy that peremptory measures are seldom necessary to its enforcement."

COST OF RATION.

The average cost of the ration per day for the year has been as follows:

Central: Barrack ration, $23\frac{4}{5}$ cents per day; hospital ration, $29\frac{1}{3}$ cents per day; general average, $25\frac{7}{19}$ cents per day. Eastern: general average, $27\frac{1}{2}$ cents per day. Northwestern: general average, 23 cents per day. Average at the three asylums, $25\frac{11}{38}$ cents per day.

To show what this ration affords to the men, the prescribed bill of fare of the Northwestern branch (the others are equally good) and the special diet list of the Central Asylum Hospital are appended, the others being substantially the same; these two being a fair average of them all.

THE TOTAL COST PER ANNUM OF KEEPING EACH MAN

may be gotten by dividing the total amount of the current expenses of each asylum per annum by the average attendance thereat. The running expenses include food, clothing, fuel, light, medicines, transportation, officers' salaries, inmate pay-rolls, &c., being every expenditure during the year, except such as may have been made in the construction or repair of buildings. This shows the expenses per man at Central, $160 79 per annum; at Eastern, $208 42 per annum; at Northwestern, $182 92 per annum; average, $184 04 per annum, less, it is believed, than in any similar institution in the United States.

FROM WHAT STATES THEY COME.

So far as reported, the disabled soldiers so supported in the several asylums, come from the several States, as follows: Maine, 72; New Hampshire, 51; Vermont, 44; Massachusetts, 136; Connecticut, 44; Rhode Island, 53; New York, 837; Pennsylvania,

729; New Jersey, 96; Delaware, 44; Maryland, 40; District of Columbia, 34; Ohio, 559; Indiana, 317; Illinois, 269; Wisconsin, 63; Michigan, 148; Iowa, 33; Minnesota, 30; Missouri, 43; Kansas, 36; California, 5; West Virginia, 8; Kentucky, 20; Louisiana, 5; Texas 6, and Tennessee, 13.

DEATHS, DISCHARGES, ETC.

Of the whole number aided during the year 142 died—14 while absent on furlough, and 80, being more than one-half of the whole, of consumption; 891, having recovered health, or been prepared in schools, workshops, or otherwise, to support themselves, were honorably discharged; and 68, for repeated violations of the rules, have been dishonorably discharged.

During the past two years there were three branches of the National Asylum in operation. The Central branch, at Dayton, Ohio, the Northwestern branch, at Milwaukee, Wisconsin, and the Eastern branch, near Augusta, Maine; and within the past few months a fourth one, called the Southern branch, has been opened near Hampton, Virginia, designed for colored soldiers, and consumptives, who require a mild climate.

Members of the committee have visited the three first-named branches, and have made careful examinations of the grounds and buildings, as well as proper inquiries into the management, discipline, and general treatment, and the method of keeping accounts and making expenditures at these branches.

The report of the secretary of the board, exhibited in the foregoing pages, as well as those of the acting governors (annexed in Appendix G, H, and I) of the several branches of the asylum, give all desirable information as to the amounts paid for land of sites, cost of buildings, and other improvements, and the expense of maintenance classified. The committee find no evidence that the price paid for the sites of the several branches was in any case unreasonable, nor that proper economy has not been exercised in the erection of buildings and the improvement of the premises. The cost of the buildings of the asylums is believed to be less than that of any Government buildings of like size and character, and important savings have been introduced in the expenditure of maintenance, by the employment of the inmates of the asylum for light labor, at a compensation reasonable and advantageous to both parties.

The committee have taken the testimony of several witnesses, (Appendix F,) which is appended to this report, and, from their manifest readiness to testify, it must be inferred that there were no facts of any importance, in connection with the management of the asylum, withheld or concealed by them.

The committee are convinced by the investigation they have made, that the funds of the National Asylum for Disabled Volunteer Soldiers have been faithfully applied by the board of managers, for the purposes intended by the act incorporating the institution, and that the general management of the several branches of the asylum established by the board has been, as far as they have been able to learn, efficient and economical. The committee have also come to the conclusion that the treasurer having accounted for all funds of the asylum which ever came into his hands, by correct entries and proper vouchers, is entirely to be exonerated from any charge or suspicion of misappropriation, neglect, or any other misconduct in the discharge of his duties; and, therefore, having no legislation to recommend to the House upon the subject, they ask that they may be discharged from the further consideration of the same.

APPENDIX A.

Amount of United States bonds registered in name of National Asylum for Disabled Volunteer Soldiers, and of Hon. B. F. Butler, president and treasurer, and the interest declared and paid thereon.

APPENDIX D.

TREASURY OF THE UNITED STATES,
Washington, December 23, 1870.

The within statement was made after an examination of the military side of the books, but an examination of the civil side shows that there was a further amount of twenty-five thousand dollars, ($25,000,) paid to General Butler by Treasury draft No. 127, on warrant No. 1205, issued September 25, 1868.

F. E. SPINNER,
Treasurer United States.

APPENDIX F.

WASHINGTON, D. C., *January* 10, 1871.

M. A. CLANCY sworn and examined.

By Mr. NEGLEY:

Question. State your residence and occupation.—Answer. I reside in Washington; I am a clerk.

By Mr. FARNSWORTH:

Q. Do you hold any official relation to the board of managers of the National Asylum for Disabled Soldiers?—A. Not to the board of managers, but to the president of the board of managers.

Q. As such?—A. As such.

Q. What is your official relation?—A. Clerk.

Q. You are clerk to the president of the board of managers?—A. Yes.

Q. As president of the board of managers?—A. That is what I understand.

Q. Who is the secretary of the board of managers?—A. Mr. Lewis B. Gunkel.

Q. How long have you occupied this relation?—A. About a year and ten months.

Q. Do you hold any other clerical or official position?—A. I do.

Mr. BUTLER objected to the question, for the reason that his private affairs were not to be inquired into. He said that he understood the animus of the investigation, and he wanted it confined to the matter before the committee. The witness might not feel himself compelled to object, and therefore he (Mr. Butler) objected.

Mr. NEGLEY remarked that whatever was relevant to the investigation might be properly brought out before the committee.

Mr. FARNSWORTH said that he regarded it as important to get at the status of the witness. It was usual to ask witnesses their occupation.

Mr. NEGLEY. The witness has already stated his occupation to be that of a clerk.

Mr. FARNSWORTH, to witness:

Q. Clerk for whom?—A. For the president of the board of managers of the National Asylum.

Q. Clerk for anything else?

Mr. BUTLER. With regard to the board of managers?

A. Nothing else.

Q. What salary do you receive?—A. Fifteen hundred dollars.

By Mr. SLOCUM:

Q. Fifteen hundred dollars in that capacity?—A. Yes.

By Mr. FARNSWORTH:

Q. Were you in the Army?—A. I was not.

Q. Are you acquainted with the several officers at the different asylums—the home asylum and the branch asylums?—A. I know the names of the different officers, and I believe I have seen them all personally—that is, the governors; I do not know all the subordinate officers.

Q. I have reference to the governors or lieutenant-governors, or whatever they may be called?—A. Deputy governors, I believe, is the title they have.

Q. Who are the officers at Dayton, Ohio?—A. Colonel E. F. Brown is the deputy governor at Dayton.

Q. Who is the governor?—A. I do not know of any one who is governor now.

Q. Who preceded Brown as deputy governor at Dayton? did any one?—A. I believe some one did, but I do not know.

Q. Do you know any of the other officers at Dayton?—A. The treasurer is J. B. Thomas; I believe his military rank is captain.

Q. What is the salary of the deputy governors?—A. I do not know.

Mr. BUTLER stated that in the printed reports the salaries of all the officers were set out, and who they were.

Mr. SLOCUM inquired whether they were disabled officers.

Mr. BUTLER. Always; they must be, by law.

By Mr. FARNSWORTH:

Q. Is Mr. Brown a disabled soldier?—A. Yes; he has lost his right or his left arm.

Q. And Captain Thomas?—A. I do not know what his disability is.

Q. Have you seen him?—A. Yes.

Q. Does he appear to have any disability?—A. He appears to be a man not in good health.

Q. Where did these officers serve in the war?—A. I do not know.

Q. Or with whom?—A. I do not know.

Q. Have you never heard?—A. No, sir.

Q. Are you acquainted with the officers at Milwaukee?—A. I have only seen the governor once.

Q. Who is he?—A. Colonel John Wooley. And the treasurer is Dr. O. H. Crandall.

Q. State to the committee whether either of these gentlemen was disabled in the service.—A. I have no knowledge of their antecedents.

Q. Do you know where they served, or with whom?—A. I do not.

Q. Have you never heard?—A. I never have.

Q. You have seen them?—A. Once.

Q. Do they appear to be disabled?—A. I did not note any marked disability, such as the loss of a limb.

Q. Do you know Mr. Cassell?—A. I do.

Q. Was he not deputy governor at Milwaukee?—A. He was.

Q. Was he a disabled soldier?—A. I do not know.

Q. Did you never hear that he was?—A. I do not know that I ever did.

Q. Do you know the officers at Augusta, Maine?—A. I have seen the deputy governor, General William S. Tilton. He is also the treasurer. The two offices—deputy governor and treasurer—are combined.

Q. Is he disabled?—A. I do not know.

Q. Do you know anything of the purchase of property near Fortress Monroe for an asylum?—A. I cannot say that I know anything of the purchase of the property in any definite way.

Q. What do you mean by a definite way?—A. The time and place and the parties from whom it was purchased.

Q. Do you know the property?—A. I have seen what I suppose to be the property.

Q. When did you see it?—A. I do not recollect exactly when; I think it was in March or April last.

Q. Was that before or subsequent to its purchase?—A. I think it was before.

Q. Who was with you when you saw it?—A. Some of the members of the board of managers of the National Asylum.

Q. Who?—A. General Martindale, General Cavender, I think; General Osborn, Dr. Wolcott, and Judge Bond; I think those were all.

By Mr. BUTLER:

Q. Was not Governor Smyth there?—A. I believe he was.

By Mr. FARNSWORTH:

Q. Of whom was the property purchased?—A. I do not know that I can state of my own knowledge.

Q. Did you see the proprietor of it at the time when you saw the property?—A. No, sir.

Q. Do you know who offered it for sale—who first broached the subject?—A. I do not know that I do.

By Mr. SLOCUM:

Q. Where is the deed of the property kept?—A. I do not know; I never saw any deed of the property.

Q, Do you know where the searches of the title deed are kept?—A. I do not. If I may be allowed to explain to the committee why I said that definitely I do not know about this matter, of course I know, as a general fact, that the property was purchased; but when it was done, or by whom it was done, I know nothing except in a general way. I know nothing of the details or the exact facts in the matter.

By Mr. FARNSWORTH:

Q. I ask you from whom you first heard of the property.—A. I do not know from whom.

Q. Do you recollect when you first heard mention of that property as being for sale?—I do not know that I can state it. I do not remember of whom, nor when I heard it. I do not know that I ever heard it mentioned by any one as being for sale.

Q. Do you know what was paid for it?—A. I do not.

Q. You never heard?—A. I have heard that $50,000 was paid for it.

Q. Did you hear whom it was paid to?—A. Excuse me. I said that I have heard, but I cannot even use that expression, because I do not know whom I ever heard say that. It is only that this knowledge has come to me in that same general and indefinite way, so that I cannot fix the time or the source whence I received it.

Q. Is there any other secretary or clerk of any of the board of managers or of the president of the board here in Washington besides yourself?—A. Not that I am aware of.

Q. Whereabouts is that land situated with reference to Fortress Monroe?—A. The land that I saw I should think is about one mile west, or nearly west of the fortress.

Q. By what term was it known before the purchase; had it any designation?—A. I have heard that it was called the Chesapeake College.

Q. How many acres did it embrace?—A. I do not know.

By Mr. SLOCUM:

Q. What buildings were upon it at the time?—A. At the time I saw it there was one large building, apparently a large public building, a college building or a hotel building; I do not know exactly how to describe it.

Mr. BUTLER remarked that the building was used during the war as a hospital, and that it was now to be used as an asylvm for the colored soldiers.

By Mr. FARNSWORTH:

Q. Were there any other buildings on the property, shanties or otherwise?—A. There was near this building a small cottage building, which was nsed, I think, as a dwelling-house.

Q. What I want to inquire about is whether this property had been settled upon or squatted upon by the colored people, any part of it?—A. I did not see any sign of such habitations.

Q. You did not see the proprietor of the property?—A. Not to know him.

Q. Do you know of the president of the board of managers of the National Asylum owning any property at Fortress Monroe?—A. I do not.

Q. You never heard of it?—A. Not in any direct way.

Q. What do you mean by a direct way?—A. I mean that I may have heard it as a matter of rumor or hearsay, or obtained it in some general way such as we get knowledge or impression of facts.

Q. Did you ever hear him say that he owned property there?—A. Not that I am aware of.

Q. Have you anything to do in the matter of keeping the accounts of the board of managers or of the treasurer of the board of managers?—A. No, sir.

Q. You keep none of their accounts?—A. No, sir.

Q. You have nothing to do with them?—A. Not as to the accounts of the treasurer of the board of managers.

Q. As clerk for the president and treasurer of the board of managers?—A. If you will allow me to explain, I will state in this connection that the treasurer and president gives me from time to time various amounts of money to be disbursed on various accounts. Some of these accounts are what may be called the petty accounts of the National Asylum—such as an individual would disburse sums of money upon. That is the only connection which I have in a money way with the accounts or with the financial business of the asylum.

Q. You have nothing to do with making deposits for the treasurer?—A. Nothing whatever.

By Mr. BUTLER:

Q. Your business as clerk is to take care of the correspondence of the president of the board of managers?—A. That is my principal business.

Q. To attend to meetings of the board of managers and to phonograph their proceedings?—A. Yes, sir.

Q. To examine and pay petty vouchers, like transportation for disabled soldiers here and there, and to fill up blanks for admission when application is made to me?—A. Yes.

Q. Please state about how many letters a day you have on this business—letters and references?—A. I do not know that I can state without making some examination to that effect; I only know they are very numerous and require considerable time.

Q. And these sums that you disburse are for these small matters of transportation—sending a man here or there, and for the traveling expenses of the board of managers, and also for stationery and office expenditures, of that description?—A. Yes, sir; I believe there are five heads under which my petty expenditures are made. One is for traveling expenses of the board of managers and office expenditures, such as stationery, telegraph bills, and other small matters. Another is transportation, which is the furnishing transportation to soldiers from point to point, as it occurs in a certain kind of irregular way. The bulk of these transportation accounts are paid, as I understand, by the treasurers of the various asylums. Another is out-door relief—little sums that are disbursed to soldiers in transitu. Sometimes a soldier wants to go to an asylum, and it is necessary for him to remain at a place for a day or two; he has nothing to subsist upon, and I disburse to him $1, $2, or $5, as the case may be, to get him along. Then there is my own salary.

Q. You say that you saw the board of managers at Fortress Monroe; state whether the majority of the board resolved themselves into a committee to go and examine that property, and whether you attended them for the purpose of acting as clerk?—A. That is my recollection.

By Mr. SLOCUM:

Q. As secretary of the committee?—A. Yes.

By Mr. BUTLER:

Q. Did the board come to any resolution upon the question while it was down there examining the property?—A. In no formal way that I know of.

Q. So that there were no proceedings to record?—A. There were no proceedings to record.

Q. The president of the board did not go down with that committee?—A. He did not.

Q. Was that at a time when Congress was in session?—A. I think it was.

By Mr. SLOCUM:

Q. There was no resolution passed by that committee?—A. Not in any formal way that I am aware of.

Q. And no record of the proceedings was kept?—A. Not by me.

Q. By anybody?—A. I do not know that there was. Only in a general way I have the impression that there was from subsequent proceedings.

Q. That is to say that there was some meeting down there where something was done and recorded, and you was not present at it?—A. No, sir. I understood that the committee of the board of managers went down there for the purpose of inspecting this property with the view to purchase, and that the committee was to report at some subsequent meeting of the board of managers what its conclusion upon the matter was.

By Mr. BUTLER:

Q. Did that committee also have it in charge to make examination and see whether it was not proper to have a place for colored soldiers, and did the committee go to Richmond in the course of that examination?—A. The committee went to Richmond; but I do not know that I can answer definitely the first part of the question, anything more than that is my impression.

By Mr. SLOCUM:

Q. Were you ever present at any meeting of the committee or of the board of managers as recorder when a resolution was passed to purchase that property, either upon that visit or subsequently?—A. I think I was present, but not as recorder.

Q. Who did record the proceedings?—A. I think that Mr. Gunkel, the secretary of the board, did.

By Mr. FARNSWORTH:

Q. Is your permanent residence in Washington?—A. Yes, sir.

Q. How long have you resided here?—A. Over five years.

Q. Where are you from?—A. My native place is Portland, Maine.

Q. Did you come here from there?—A. No, sir; I came here from Philadelphia.

Q. How long had you resided there before you came here?—A. About a year.

BENJAMIN D. WHITNEY sworn and examined.

By Mr. FARNSWORTH:

Question. State your residence and occupation.—Answer. I reside in Washington; I am a clerk.

Q. How long have you lived in Washington?—A. Four years.

Q. In what employment?—A. As a clerk.

Q. For whom?—A. In the office of General Butler, and sometimes as clerk to corporations—the Market-House Company, for instance. In the absence of General Butler and his clerk during the intervals of sessions of Congress, I represent the National Asylum, so far as giving transportation and examining soldiers.

Q. And you are now clerk to the Market-House Company?—A. Yes, sir.

Q. Anything else?—A. Not to speak of.

Q. Anything else not to speak of?—A. No, sir.

Q. Is your only connection with the board of managers of the National Asylum what you have stated it to be in the absence of Mr. Clancy?—A. Precisely. I have to examine the thousand applicants that call at General Butler's office in the course of the year. The examination is as to their fitness to be forwarded to the asylum.

Q. Do disabled soldiers come to Washington to be examined as to their fitness for admission to the asylum?—A. Yes, sir; in very large numbers. They come here for bounty or pensions. It is a central point for them.

By Mr. BUTLER:

Q. Is there any regulation by which they have to come here?—A. There is no regulation by which they have to come here.

By Mr. FARNSWORTH:

Q. But many of them do?—A. Many of them do.

Q. And in the absence of any one else you decide on their fitness for admission?—A. I do, with the assistance of an examining surgeon.

Q. What salary do you receive for that?—A. Nothing.

Q. Do you work for nothing?—A. I do that work for nothing.

Q. Do you not receive any salary from the board of managers, or from the treasurer of the board of managers?—A. No, sir.

Q. Have you nothing to do with the keeping of accounts in regard to that?—A. Nothing at all. I have stated my entire relations with the National Asylum. If I am at leisure and a half dozen soldiers come to the office they are referred to me.

Q. Then you are not at all a secretary of the board of managers?—A. Not at all, and I can give no information about the board.

Q. You know nothing of its doings?—A. Nothing at all; I know personally the managers of the asylum favorably and well, but I have nothing to do with the records of the correspondence. I have books of record stating the examination of six or seven hundred soldiers that have been forwarded under my own examination. The office is a sort of breakwater for the executive. I have sent forward upward of six hundred persons to the asylums.

Q. Within what length of time?—A. Within three years; and three times that number have been rejected as unfit.

Q. Do you know how many there are in the different asylums?—A. Three or four thousand.

Q. As many as that?—A. That is my impression.

Q. Then a very large proportion of them come to Washington for examination?—A. Yes, a great many of them. I am compelled to examine many who are sent to the office by General Dent. Hardly a day passes that there are not twenty soldiers there, and perhaps I have to examine nineteen of them and eighteen of them are rejected.

Q. All through the year?—A. Through the year.

Q. Do you do that this winter?—A. In the absence of Mr. Clancy I do it.

Q. But do you do it while he is here?—A. Yes, sir; when I am not occupied, I am very happy, indeed, to do it.

Q. And they come pouring in every day?—A. Every day. I have them come in the morning. I am a pretty early bird, as old men generally are, and I require that they shall be at the office at 8 o'clock. Sometimes, when I come to the office at 8 o'clock, I find ten men there waiting for examination.

Q. What is your other business?—A. I represent at this present moment some twenty cases before the Mexican commission, involving very large amounts and requiring a great deal of clerical labor.

Q. Do you represent them as an attorney?—A. No, sir; I am a clerk.

Q. Do you act as attorney?—A. As attorney in fact simply.

Q. For whom?—For the various claimants, my constituents.

By General BUTLER.

Q. I want you to give the committee the form in which this business is done. Say whether I state it correctly. There is a printed form of application, which has to be filled up by somebody for the soldier, then the soldier goes before an examining surgeon and is found to be disabled then he returns and gets the signature of the president or of one of the board of managers?—A. Yes, sir.

Q. Then the admission is signed?—A. Yes; I have nothing to do with the signature admitting them that is done by the president.

By Mr. SLOCUM:

Q. Do you require the soldier to produce his discharge?—A. In all cases. That is a *sine qua non*.

By Mr. BUTLER:

Q. And his pension certificate?—A. And his pension certificate, if he has got a pension.

Q. Then a certificate of transportation is given him?—A. Precisely.

Q. With coupons for the several railroads over which he passes?—A. Yes.

Q. That is also signed by the president or by one of the board of managers?—A. Exactly.

Q. And there is an arrangement made with the railroads by which these men travel at half price upon their certificates?—A. That is it.

Q. The soldiers can go to any one of the other eleven members of the board of managers and have that same thing done for them in any part of the country?—A. That is it.

Q. What brings such a large number of disabled soldiers here is that they come here to get their pensions or bounties and find themselves without money and without care?—A. Yes, sir; that is it.

WASHINGTON, D. C., *January* 18, 1871.

Hon. BENJAMIN F. BUTLER sworn and examined.

By Mr. FARNSWORTH:

Question. I desire that General Butler should first state his official position in his relation to the board of managers of the United States military asylums.—Answer. I

was elected president and afterward acting treasurer of the board of managers, and have been so since its organization.

Q. Please state to the committee the amounts of money that have been drawn by the board of managers, or yourself, for the asylums, and from what funds, and the several dates.—A. When this investigation was ordered I applied to the Treasurer of the United States for a certified voucher of the amounts, and from what funds drawn from the Treasury, with the dates; and I received from him the following letter of transmittal with this paper, which contains the amounts to the date. This is his certificate. My accounts were made out up to the 15th of October, and this is dated the 17th. (Copy of letter appended and marked A, and also the statement of account.) That contained, when it was received, these amounts, which were all, with one exception. Upon examining the amounts myself at home I found there was one omitted, notwithstanding the particularity of this certificate. Not having the means of verification at Lowell, and being obliged to leave on the 20th to meet the board at Dayton, I kept this certificate, as it then was, as my voucher; and I give it to you as the answer to the question. When I returned to Washington on the 17th of December, I wrote a letter to the Treasurer, of which this is a copy. (The copy is appended and marked B.) Thereupon Mr. Treasurer Spinner returned this letter with the indorsement which you see. (See copy, marked C.) So that now the statement of moneys drawn from the Treasury is absolutely correct so far as I know.

Q. Up to the present time?—A. No, sir; up to the date of that letter.

Q. What amount has been drawn since?—A. That I cannot answer with certainty, but very nearly. By the rules of the Treasury Department the accounts are made up every month, and I get, from the 5th to the 17th, the money. I think I got, about the middle of October, $14,000. About the 7th of November I got $14,000; and I got, I think, $22,000 in December, on the 9th or 10th, perhaps not till the 17th. I then collected the interest up to the 5th of January on the investment; was, I think, $27,000 in gold; and also a $52,000 draft, which was made up to the 1st of January. There was one amount of $5,000 which I forgot to mention, which I did not get till the 5th of January.

Q. Does that contain the interest drawn at different times prior to making up the account?—A. I do not remember. If it does not, here is another one that does. There is here, also, a certificate of the amount of United States registered bonds, with the dates and descriptions of the bonds, and the amount of interest paid in coin or currency, which contains $5,000 not drawn at date, and which I had forgotten to draw. The checks on these various amounts, if I remember right, are those made by this committee, when they examined this statement and compared it with my accounts. I might state here that, on the 30th of last December, the accounts of the National Asylum were overdrawn on the acting treasurer, by the several branches, to the amount of fifty-odd thousand dollars; that is to say, I had paid out more money than I had received. It became necessary to settle up bills on the 1st of January, and before I could get the January accounts, the amounts paid out by me amounted to over $50,000, so that on the 31st of December the asylum owed me nearly $50,000, which I could have got if I had been here, and the account had passed the several Auditors.

Q. What donations or grants, other than in money, have been received from the Government?—A. None, except some condemned cannon and some lumber at Camp Chase, and one suit of clothing for each soldier, which is given as he goes in.

Q. No real estate and no personal property?—A. No, sir.

Q. Can you state what amounts have been received, by way of donations, from charitable bodies, States, or towns?—A. I can state with substantial accuracy. We received from the ladies at Milwaukee the donation of about $90,000 in United States bonds, 7-30's, and other United States securities; about twenty-five acres of land, which they had bought for a soldier's home; and some wild land, which had been subscribed for them, amounting to very little value, around in various parts of Wisconsin, where men had given lots of land, and one small lot in Milwaukee, from which we have realized some $250. From Dayton, the citizens, or a meeting of the citizens, or some body of people there—I do not speak with accuracy—gave $20,000 or $30,000 toward buying the site for the asylum. If we chose to locate in Columbus, the State of Ohio gave the old furniture of an asylum in Columbus; and from the relics of a hospital fund we received $10,000 in 7-30 bonds. The newspaper branch of the Army of the Potomac gave us, I think, one hundred and twenty-odd dollars. These are all the donations that I now remember having received. A gentleman has died in London, by the name of Ward, who gave us $100,000; but his estate is in the process of settlement, and I have taken the necessary measures to make good our claim in London.

Q. Can you state how much has been received from the pensions of inmates of the asylum?—A. Nothing that comes to the asylum of any consequence. The rule of the administration of pensions is this: by the act we are allowed to take all the pensions; they are all assigned to us by law, when the pensioner enters the asylum, to be used as we think fit. Under a regulation of the board, made in September, 1868, I think, we established this rule, that all pensions should be paid to the treasurer of the

branch asylum; that where the pensioner had a wife, child, father, or mother dependent upon him, the pension, or so much of it as he directed, should, through the treasurer, be sent to the relative so dependent, in money on his order; and for that purpose I got each of the asylums made a money-order office so that we could transmit the money orders. And if he had no one dependent upon him, then he could say whether his pension should pay for his clothing, independent of the suit given by the United States, and the remainder invested by the several treasurers of the several branches in savings banks or in such other manner as they could, under their official bonds, for the benefit of the pensioner, so that if he went out into the world with an honorable discharge, able in any way to support himself, he should have the money to help him start in business. If it was evident that he never could go out, it was paid back to him in small amounts for his convenience in obtaining necessaries. If at any time he was honorably discharged, the balance was paid over to him by the treasurer; but if he deserted, the balance in our hands was forfeited to the asylum. I have nothing to do with these moneys. These are administered by each treasurer at each branch, and the accounts are audited once in three months, so that if the pension is taken up in small amounts, it is shown by the accounts of the asylum, and not by mine.

Q. Is there a treasurer at each asylum?—A. There is.

Q. Does he draw on the treasurer of the board for sums to carry on the asylum?—A. The method of administration is this: Each quarter the board meet, receive the accounts of the previous quarter, and examine them. There is a careful system of accounting, and then estimates are made for what will be wanted for construction, for current expenses, clothing, subsistence and out-door relief, which is an expenditure that the board is authorized to make. That is made up and reported to the board or the president, and then an appropriation is made, and a resolution, under the seal of the institution and the board, is made, and the secretary of the board countersigns it, and it is returned to the general treasurer as so much subject to draft. These amounts are then sent to each treasurer as they are wanted; usually one-third every month of the quarter—sometimes more, sometimes less—as where construction is going on, that construction may or may not call for all that is wanted at once. For instance, if construction goes on faster than it was expected, more will be wanted at once; and if a little slower, then it will not be drawn so fast.

Q. Much of that can be understood; cannot you condense your answers?—A. I cannot, and give you the exact state of the facts.

Q. Does the treasurer of the asylum draw on the board for anticipated wants?—A. No, sir; it is forwarded as wanted by a certified check or draft.

Q. Who certifies?—A. That is done where the treasurer happens to be. If he were in Washington, it would be there; if in New York, it would be there; and if at Lowell, it would be there, at some bank in either place. We used to allow the treasurers to draw, but in some instances there were found to be great delays by the banks in transmitting, therefore it was thought best to take this course.

Q. Where are the accounts of the board of managers kept?—A. Wherever the treasurer happens to be. When in Washington, they are here.

Q. I mean the bank accounts; where do you deposit?—A. After the money is appropriated, that amount is taken up by the treasurer on his bond, as by himself, and deposited in his bank; sometimes a portion in Washington, sometimes in New York, if needed there; sometimes in Boston, if needed there.

Q. Do you give bonds?—A. I give bonds to the amount of $100,000.

Q. How much have you now on hand belonging to the asylum?—A. I have probably $25,000.

Q. In cash?—A. In cash; I have no bonds whatever.

Q. Where are they?—A. All the bonds which we have are registered bonds, in the name of the National Asylum, which cannot be drawn or sold without a resolution of the board.

Q. This money is paid to you in currency, is it not?—A. Yes, or in gold at currency value.

Q. Who converts that into currency, do you?—A. Generally. There are four instances in which it has been done otherwise. When a larger amount has been appropriated than will probably be wanted through the year, it is converted into bonds, which has happened in four instances.

Q. Then you do it?—A. Yes, sir, I do it.

Q. Where are these bonds kept?—A. They are kept in the safe of the Institution for Savings, at Lowell, Massachusetts, where I keep other valuables of my own, and which I cannot take about the country. They are registered bonds.

Q. What bank is that?—A. It is a savings bank.

Q. Are all the bonds registered bonds?—A. Every bond I have is a registered bond.

Q. Have you a list of the bonds?—A. Yes, sir; the amount is $1,416,000.

Q. Are the dates when they were purchased given?—A. The dates when they are registered are given.

Q. Aside from the registered bonds, then, you hold not to exceed, as you stated,

$25,000?—A. Not to exceed $30,000, I am certain. Sometimes I have larger sums than that.

Q. Are you obliged to convert these bonds into currency for the purposes of use?—A. Whenever out of funds. Before the resolution was passed, by giving the sick and deserters' account to the soldiers' fund, last March, we converted $50,000. That was by a resolution of the board, and that was transferred to the treasurer directly; and it was sold at once to the Treasurer of the United States. Mr. Boutwell was kind enough to take the bonds, as he was then buying United States bonds.

Q. If I understand you, you have received, on behalf of the asylum, from the Government of the United States, between from four and five millions of dollars?—A. That amount, plus $25,000.

Q. That amount has been converted into bonds?—A. No, sir; by no means.

Q. What portion of it, then, has been converted into bonds, and what not converted?—A. The whole amount converted into bonds, plus $50,000, is $966,250, (1867s;) $200,000, (10-40s;) $300,000, (Pacifics.) [See copy appended and marked D.]

Q. That is all?—A. That is all.

Q. The balance of this four and a half millions, or thereabouts, has been expended without having been first converted into bonds?—A. Yes, sir; from day to day and from time to time, in construction and in expenses.

Q. And no interest was drawn upon that?—A. No, sir.

Q. Where did you make your deposits of that?—A. I never had that amount at one time; all that was not wanted for quarterly appropriations was converted into bonds. No bank account of that has been kept with the National Asylum.

Q. You made your appropriations only from quarter to quarter. Did you have this money yourself?—A. No, sir.

Q. Where was it?—A. It was in the Treasury of the United States.

Q. Then from month to month you had it?—A. Yes, sir.

Q. Then you might have the amount for two months on hand, might you not?—A. Sometimes I would, and sometimes I would not.

Q. Did you deposit this money?—A. Yes, sir; but not in the name of the National Asylum.

Q. Where and with whom did you deposit it?—A. I deposited it, as money in my own hands, according to my residence for the time—sometimes in Washington as a portion of my bank account here, sometimes in New York, and sometimes in Lowell.

Q. It was a portion of your own individual bank account?—A. Certainly.

Q. With nothing to distinguish it from your private account?—A. Certainly not.

Q. In what banks did you deposit it?—A. In Washington, with Jay Cooke sometimes, and sometimes in the National Bank.

Q. In Lowell with which bank?—A. In the National Bank.

Q. Who are the officers of that bank?—A. I cannot tell you; I am there so little that I do not know who they are, except perhaps the cashier.

Q. Have you any interest in that bank?—A. Not a dollar; I wish I had.

Q. Is Mr. Field connected with that bank?—A. Never to my knowledge.

Q. Have you an agent in Lowell who draws or deposits in this bank for the National Asylum for you?—A. I have a part of the time.

Q. Who is he?—A. I decline to answer inquiries into my private affairs.

Q. I wish to know who is your agent, who deposits or draws money for you from the National Bank?—A. I have no agent who does either.

Q. You have none—never have had?—A. I have none.

Q. Then this money, I understand you to say, amounting to some three millions and upwards, which has not been converted into bonds, has been kept by you on deposit in your individual account, and drawn and disbursed by you, without keeping any separate account?—A. To that I answer, if you so understood me, you very much misunderstood me.

Q. If I misunderstood you, I desire to be corrected; that is certainly as I understood you.—A. I have already explained to you that this money is drawn from day to day, and from time to time; and expended from day to day, and from time to time, in small sums—sometimes the asylum indebted to me, and sometimes I indebted to the asylum.

Q. Do you send to the asylums money from day to day?—A. Almost from day to day, taking the three asylums. I have done exactly this. As I have received from time to time the money, after it was appropriated, I have either charged it to myself, and kept the balances so charged, and sent it off to the treasurers of the several branches, as it was wanted, or sometimes I have sent the very check to the asylum that I have drawn from the treasury.

Q. Have you kept an account of the moneys you have thus sent to the asylums for their expenditure?—A. Certainly.

Q. Have you got it?—A. Yes, sir.

Q. Can you produce it?—A. Yes, sir.

[The book was presented for examination.]

Q. That contains the list, does it, entire?—A. Yes, sir.

Q. Does that give with the amount of bonds and the amount of $25,000 or $30,000 which you now have on hand, the entire amount?—A. It did comprise the entire amount up to the 15th of October, when that was examined in this committee. Subsequent to that time the accounts have not been made up.

Q. When was that book written up?—A. That book was written up at the time I went over all the vouchers, and got them in order to have them vouched. It is necessary to explain. You will observe that there was then an apparent balance in my hands of $98,000. Within four days of that time it became necessary to pay out between $30,000 and $40,000 of that money. It went to the treasurers of the asylums.

Q. Have you any means of telling the committee how much of that money belonging to the asylum you have deposited in your bank in your own private account, all together, from first to last?—A. I cannot. As it was put in and drawn out from day to day, it is impossible, except as the account will show.

Q. The whole of this money, then, has been expended upon these asylums, except the amount you state to be on hand?—A. Yes, sir.

Q. Can you give the committee the probable amount that will be received from the funds which have been devoted to it?—A. I cannot, but I wish I could; and I will state the difficulties. By the law the amounts forfeited by desertions, by sentences of court-martial, by fines, and by unclaimed back pay, that has been unclaimed for three years, are credited for the examination of the auditor, and go to the benefit of the asylum. Then if after a portion of that back pay is credited it turns out that there is a claim made for any of it, by reason of the deserter's having his disabilities removed, or the coming forward of the heirs for the money which was unclaimed, then that amount is charged back; so that the account is a shifting one, and it varies from all possible sums. For instance in the early part of the time it ran up to large amounts; then again later, it ran down as low as $5,000; then up again to $9,000, and then to $50,000. It is impossible to give an exact estimate.

Q. What was the amount of the Quaker fund, as it was called?—A. About $300,000.

Q. In regard to the sites that have been purchased for asylums, what was paid for the site in Maine?—A. There was agreed to be paid $50,000. After the purchase it was ascertained that there were some incumbrances to the amount of $10,000, and $40,000 and interest was paid, and it lay along till some of the incumbrances were off, and then $9,000 more was paid. Then there were two small mortgages that were to be paid off and canceled, and we still retained $1,000 of the purchase money. $49,000 were paid and some little interest.

Q. What was paid for that at Fortress Monroe?—A. Fifty thousand dollars.

Q. How much for that at Dayton, including donations?—A. That appears in the report made by Mr. Gumble. And for that at Milwaukee it also appears as about $100,000.

Q. Who made the purchase at Fortress Monroe?—A. Governor Smith and Mr. Gumble.

Q. Who selected the ground at Fortress Monroe?—A. The whole board, with one exception; that was the president, who was in Congress and could not go down.

Q. Who suggested that property to the board?—A. The president and General Lawton, who had been a sick officer.

Q. You had seen the property before?—A. Oh, I knew all about it.

Q. You had owned the property once?—A. Yes, I had owned that.

Q. From whom did you purchase it?—In many ways. I will state the circumstances. The property at Fortress Monroe was the Chesapeake Female College, which was taken in 1861 for a hospital. While used as a hospital Secretary Stanton desired me to see if the title could not be extinguished. There were eight corporators, four loyal and four disloyal; and there were considerable debts of which we could not tell anything because the records of the courts had been burned at Hampton. Thereupon I purchased four shares at $12,000, and Mr. Stanton ordered the other shares to be confiscated; but before the confiscation got through the courts the order of President Johnson stopped it. When I settled my accounts with Mr. Stanton, I charged the Government $12,000 and credited myself. Mr. Stanton said, "We are in trouble now, about this purchase, which I expected we could settle by an act of Congress, and I cannot take this title." Then I charged back that $12,000. Then the Freedmen's Bureau took it in charge and they occupied it awhile. Then General Schofield occupied it for a time as headquarters, and I tried to get some rent, and I believe I got $300, or something like that. Then one of the loyal owners resided upon it, and he claimed a house there and a lot of an acre, and that was an incumbrance. After that I found a large incumbrance amounting to $20,000 more upon it. When the rebels came back it was settled by a decree of the court. Thereupon I paid $20,000 and odd more; and I have tried and have succeeded in adjusting the title by settling some outstanding debts to the amount of $8,000 more. Then I have tried to make a bargain with the gentleman who claims to own the house and lot. I then, wanting some money, mortgaged it for $38,000. General Schofield wanted to buy it for $64,000, and recommended it to Congress to be bought, but Congress did not act upon the proposition. He wanted more land, includ-

ing the adjoining farm. There are forty acres of land, every one worth $300 an acre and a building which cost, before the war, $65,000, (a large brick building,) as I was told.

Q. Did you sell it?—A. I did not sell; but it was sold with my advice and consent.

Q. You paid $12,000 in the first place on behalf of the War Department?—A. Yes; in 1864.

Q. How much have you paid in all?—A. I reckon a little rising of $42,000, with what I have to pay.

Q. What have you paid actually?—A. I have paid, or my lawyer has paid in the courts, $20,000 and upward. I assumed some debts and agreed to pay $8,000.

Q. Agreed to pay?—A. Yes, sir; and have paid a part of it.

Q. Was that for incumberances upon it?—A. No, sir; liens.

Q. What kind of liens?—A. Some building liens, and some others.

Q. There were other buildings there?—A. Yes, sir; quite a number. And when the War Department got through with them, we tore them down and sold them.

Q. The War Department furnished you the $12,000 to purchase it in the first place?—A. No, sir.

Q. Then you bought it with your own money?—A. I did; and in the settlement of my account it was not allowed me.

Q. Then you recommended it to the board of managers to be purchased?—A. I suggested it and they went down; and they were unanimous in their opinion in regard to it.

Q. How much did they pay for it?—A. Fifty thousand dollars.

Q. Have they a title?—A. They have. But all that has been done, I should say, gentlemen, since this investigation commenced. What we did we did knowing we were under investigation.

Q. Who recommended the proprerty at Augusta?—A. I did not.

Q. Do you know who did?—A. I can tell you all I know about it. A Mr. Beal, who built the Treasury extension had expended $100,000 there in erecting a first-class hotel; and died. His widow came and offered the property, and I told the committee about it, and they visited it.

Q. Did you have any interest in it?—A. Not the slightest.

Q. Had you in any of the other sites?—A. Never; not any, save at Hampton.

Q. Do you know who recommended the Dayton property?—A. Well, I guess General Schenck did as much about that as any one.

Q. The town was anxious to get the asylumn and gave a bonus for it?—A. Yes, sir. The question was between that and White Sulphur Springs. We thought the White Sulpher Springs place was held too high, and we took the place at Dayton.

Q. What officers have been in charge of the asylum at Augusta from the first? Who has been deputy governor?—A. The first deputy governor was E. W. Hinks; and he left to go into the Army as lieutenant colonel. The next was Colonel Nathan Cutler of Maine, near by. The next was Charles Everett, who has left to be examiner in the Patent Office here. The next was Colonel E. A Ludwig, and the present deputy is General W. S. Litton.

Q. Who, at Milwaukee, have been deputy governors?—A. The first was Theodore Yates, I think, a retired officer of the United States Army, though I believe he had been a volunteer officer. He was deputy governor from the first until 1870, I think, when Colonel Cassel was sent as acting deputy governor; and in 1870, having been there less than a year, he was discharged or resigned, and Colonel Woolley, of Cincinnati, who was provost marshal at Baltimore under General Dix during the war, was appointed deputy governor.

Q. Had either of these gentlemen been disabled by wounds in the service?—A. Mr. Yates was a retired officer, on account of wounds. Major Cassel, who was the acting deputy governor, was not disabled. Colonel Woolley was disabled and reduced by sickness. I never knew him. (In answer to conversation.) I want to say that I do no purchasing for the establishments, except of the Government. I purchase clothing and medical supplies of the Government when they will sell them.

By Mr. SLOCUM:

Q. Did Major Cassel ever serve with you?—A. Yes, sir. I found him, when 1 went to Fortress Monroe in 1864 as provost marshal, and I kept him there.

Q. Is he out of the country now?—A. No; he is at Cheyenne.

By Mr. FARNSWORTH:

Q. Did Woolley serve with you?—A. No, sir; not at all.

Q. Who are the treasurers of these institutions?—A. O. S. Crandall is treasurer at Milwaukee; was appointed acting treasurer in November last; and is expected to be surgeon at one of the branches pretty soon. J. B. Thomas is treasurer at Dayton; and he takes the place of a soldier who died there. I believe him to be a disabled soldier.

Q. What is the salary of the deputy governors?—A. Twenty-two hundred dollars, I think.

Q. I see by the law which first incorporated this board that it is provided that on member should be a member of Congress; and upon your election to Congress I understood that portion of the law was repealed?—A. Yes, sir; that was done after I was elected, at the request of the board.

Q. Did you suggest it to the gentleman who moved it in Congress?—A. By no manner of means. On the contrary, the committee of the board, without my wish, went and made the suggestion themselves. I would have been very glad to be relieved.

A.

TREASURY OF THE UNITED STATES, CASH DIVISION,
Washington, October 17, 1870.

SIR: In compliance with request in yours of the 12th instant, I hand you herewith statements of the amounts paid to you on account of the National Asylum, on warrants and as interest on stocks of the United States purchased by you.

The statement of the amounts paid upon warrants I have proved to be correct by the books of the Secretary's Office, of the Second Auditor's Office, and of this Office.

The statement of bonds registered in name of the asylum is certified as correct by the chief of the proper division in the Register's Office, and the account of interest paid is shown by the books of this Office.

You ask for "a certificate of the investment of the National Asylum now in the Treasury." Unless by this is meant a statement of the amount invested in United States bonds, I am at a loss to know what is meant or how it can be obtained.

Very respectfully,

F. E. SPINNER,
Treasurer United States.

Hon. B. F. BUTLER,
Lowell, Massachusetts.

B.

WASHINGTON, *December* 17, 1870.

MY DEAR GENERAL SPINNER: I have the honor to inclose back to you herewith your paper containing the amounts paid by draft to me as president of the National Asylum, which I procured for the purpose of vouching the credit of my account with the National Asylum for the congressional committee, and which was inclosed to me in your letter of October 17, 1870, which contains this certificate: "The statement of the amounts paid upon warrants I have proved to be correct by the books of the Secretary's Office, Second Auditor's Office, and of this office."

With such a certificate and such verification, when I went before the congressional committee, I did not dare set up my own accounts as correct in opposition to it, and therefore charged myself with only the money that your certificate called. But as I had heretofore accounted for more money to the auditing committee of the National Asylum, and also found that I had more to the credit of the National Asylum, than that certificate shows, I venture to reinclose it to you and ask your reëxamination.

If I am correct, I am quite certain that some time in September, 1868, there is another amount received by me on behalf of the National Asylum by draft on the Treasurer. As I have no other description of that credit than that, I can furnish you none. I do not give the exact date, because the date on my books and the date of issue from the Treasury would be different, but not far different.

Please have a reëxamination made and see if I am right or wrong. I should be glad to have it ascertained either way, because if I am wrong I have got more money than I thought I had. If I am right, then it would be a great feather in my cap that my book-keeping is better than that of the United States, with all its checks and balances.

I have the honor to be, very respectfully, your obedient servant,

BENJ. F. BUTLER.

F. E. SPINNER, Esq.,
Treasurer United States.

TREASURY OF THE UNITED STATES, CASH DIVISION,
Washington, June 28, 1870.

MY DEAR SIR: I am in receipt of yours of the 28th instant, and now, as suggested by you, inclose a corrected statement of the bonds registered in the name of the National Asylum for Disabled Volunteer Soldiers, and of yourself as president and treasurer.

I beg to say, in explanation of the inaccuracy in the statement previously furnished, that I had in my office no record of the 10-40 bonds or the Pacifics, they having never appeared upon any schedule that had up to that time been in my possession, for payment of interest; and that the clerk assigned to make up the statement was assured in the office of the Register of the Treasury that the statement furnished you was correct, and I had no means of knowing otherwise.

Very truly, yours,

F. E. SPINNER,
Treasurer United States.

General B. F. BUTLER,
House of Representatives, Washington, D. C.

C.

TREASURY OF THE UNITED STATES,
Washington, D, C., December 23, 1870.

The within statement was made after an examination of the military side of the books; but an examination of the civil side shows that there was a further amount of $25,000 paid to General Butler by Treasury draft No. 127 on warrant No. 1205, issued September 25, 1868.

F. E. SPINNER,
Treasurer United States.

D.

Amount of United States bonds registered in the name of the National Asylum for Disabled Volunteer Soldiers, and of the Hon. B. F. Butler, president and treasurer, and the interest declared and paid thereon.

WASHINGTON, D. C., *January* 21, 1871.

Hon. BENJAMIN F. BUTLER recalled and examination continued.

By Mr. FARNSWORTH:

Question. At what time is the draft or the money forwarded to the several asylums, at the beginning or at the close of a quarter, for the expenses of that quarter?—Answer. Neither. It is forwarded according as the money is wanted, and as the accounts of the last quarter's or the last month's expenditures show to be necessary. The meetings are not held exactly at the beginning of the quarter; for instance, our last meeting, I believe, was not held till the 17th or 19th of December; the quarter commenced on the 1st. In that case it is necessary sometimes to anticipate the appropriations a little, taking care to keep within a safe amount.

Q. What I desire to find out is whether the treasurer at one of these asylums has the money on hand to meet the current expenses, or does he buy on credit during the quarter?—A. He does not buy on credit, except small articles from day to day, like where a man sends to his grocery.

Q. Does he buy on credit and make bills running a month or a quarter until he gets

funds, or does he have funds on hand?—A. He has funds on hand whenever he makes his estimates.

Q. He makes his estimates and the funds are sent to him?—A. Yes.

Q. Is that the custom?—A. It is the rule. It takes some time to examine the estimates; three or four or five days.

Q. These estimates are examined by the board?—A. No, sir.

Q. By whom?—A. By the treasurer of the board.

Q. Yourself?—A. If you desire to understand it I can show you, by the bundle of accounts which I have here, exactly how it is; I have taken all the accounts here for a quarter, so that you can see exactly what is done.

Q. Does your bundle of accounts show when the money has been forwarded to the several asylums?—A. No, sir. It does with this one; but I have not all the accounts here.

Q. Which one is that?—A. This is the Eastern branch, I think.

Q. I see by this abstract that it gives the amount of interest drawn at the several dates, and the dates when interest was drawn on the registered bonds; what is done with that interest when drawn?—A. That interest, in gold, is sold at the current price of gold, and credited in the account.

Q. Is it added to the funds on hand?—A. Added to the funds on hand.

Q. And deposited with the rest, as you stated the other day?—A. Yes, sir.

Q. It seems that there was a transfer of $50,000 of the bonds last March?—A. Yes; that was in anticipation of the failure of the monthly estimates. It became necessary to do that under a resolution of the board.

Q. The bonds were sold so that you could be in funds?—A. So that we could be in funds. Soon afterward, however, Congress passed a law for the deserters' fund, which put us in funds.

Q. You have not invested in bonds since then?—A. Oh, yes; over $800,000.

Q. I see that, on May 26, you invested $70,000 in the 1867's?—A. Yes.

Q. May 27, $170,000 in 10-40's; May 28, $30,000 in 10-40's; May 31, $230,000 in 1867's; May 26, $300,000 in Pacifics?—A. Yes. Those Pacific bonds are the currency 6's of the United States. They are not the Union Pacific bonds.

Q. Up to last May you had invested but about $660,000?—A. Up to last May I had invested $666,000.

Q. And you had received up to that time how much?—A. I should say, speaking roughly from memory, in the neighborhood of two and a half millions.

Q. More than that?—A. It might possibly be three millions, from the Treasury.

Q. Have you any objection to exhibiting to the committee your bank account, showing the deposit of those funds?—A. I cannot exhibit my bank account showing the deposit of this fund without exhibiting my private bank account, as to which I am under the direction of the committee.

Q. I understood you to say that you have deposited the money in your private account?—A. Part of it.

Q. Everything that is not in bonds?—A. No, sir.

Q. Did you not so state the other day?—No, sir; I did not so state.

Q. In what manner have you deposited it?—A. Sometimes I have not deposited it at all.

Q. You stated that before. But whenever you did deposit it, did you not deposit it in your private account?—A. Yes; as I stated twice before.

Q. Have you any objection to exhibiting to the committee the book showing your private bank account at that period?—A. I am under the direction of the committee. I have no objection to exhibiting it whenever the committee has any evidence or any belief that I have failed to account for any money that I have received. But having the certificate of the committee which examined my vouchers that I have accounted for every dollar that I have received, I do object to the exhibition of my private accounts.

Q. The certificate of what committee?—A. The certificate of this committee.

Q. That you have accounted for every dollar that you have received?—A. Yes.

Q. Have you such a certificate?—A. I have. It was made upon the examination of the vouchers.

Q. When was that received?—A. It was received at the time the vouchers were examined and the accounts were examined on the credit and on the debit side.

Q. Was your bank account examined at that time?—A. It was not; there was no occasion to examine it.

Q. Was that certificate given before any investigation was made, and before witnesses were heard by this committee?—A. No, sir; it was given while the investigation was being held.

Q. For what purpose was that certificate given?—A. Because, when the committee had got through the accounts, and checked them, I wished to have the fact certified.

Q. And you have that certificate from this committee?—A. I have.

Q. Produce it.

WITNESS produces the account book, in which the following certificate is written:

"MILWAUKEE, WISCONSIN, *October* 18, 1870.

"The account contained in the foregoing pages, from 2 to 19 inclusive, was examined by us, members of the Military Committee of the House of Representatives, charged by resolution with the investigation; and the items in the credit side of the account were compared with a certificate from F. E. Spinner, Treasurer of the United States, of all the moneys which stood charged on the books of the Treasurer to the National Asylum, and found to be correct. The debtor side of the account was found to be properly vouched in each item.

"JAMES NEGLEY,
"*Chairman of the Committee.*
"JASPER PACKARD."

The committee declined to order the presentation of Mr. Butler's private bank account.

By Mr. FARNSWORTH:

Q. Tell the committee a little more precisely than you did the other day how much money you have been paid yourself for the property at Fortress Monroe; how much money the board of managers has paid you for that property?—A. Not a dollar.

Q. Did you not own that property?—A. I owned a redeeming interest in it—a right to redeem. There was paid for it, what I stated with great exactness the last time I was examined, $50,000.

Q. Who received that money?—A. Mr. F. Ames Hildreth.

Q. Is he a relative of yours?—A. He is.

Q. What relation?—A. He is a brother-in-law of mine.

Q. How came he to own an interest in the property; do you know?—A. Yes; I explained that the other day.

Q. I do not think his name was mentioned.—A. No, sir; his name was not mentioned.

Q. What was his interest, and how did his interest come?—A. His interest came in my conveying it to him as security for certain moneys which he was to advance on my account some time since.

Q. When was that conveyance made by you to him?—A. I think in the latter part of last winter or early in the spring.

Q. Was that conveyance recorded anywhere, to your knowledge?—A. My belief is that it is recorded in some record in Virginia.

Q. What was the conveyance—a deed, a mortgage, or a trust-deed?—A. It is a deed.

Q. Of that identical property?—A. Of that identical property.

Q. You did it to secure him?—A. I did.

Q. Why did you make an absolute deed if it was to secure him for money?—A. Because I chose to do so.

Q. What was the amount of money which you deeded him this land to secure?—A. Thirty-eight thousand dollars was the amount that I expected to receive from him.

Q. You had not received it then?—A. Not all of it.

Q. Had you received any of it?—A. There was money advanced by him, and I expected to be in an operation with him to some considerable amount.

Q. How much had you received from him at that time?—A. I cannot at this moment tell. I did not know that it would be a subject of investigation.

Q. How much were you to receive?—A. Thirty-eight thousand dollars.

Q. How do you know that it was precisely $38,000?—A. Because I remember.

Q. Then why not tell how much you had received before that?—A. Because I do not recollect.

Q. Can you not refresh your recollection?—A. I cannot refresh my recollection exactly as to how far our negotiation had progressed at the time the deed was made.

Q. You can recollect how much you were to receive, but not how much you had received?—A. That is it.

Q. Are you entirely certain, is your memory accurate, that you had really received anything at that time? Was it not all in the future?—A. I cannot say that I am actually certain that I had received any special sum at that time.

Q. Then, upon reflection you are inclined to think that it was all in the future?—A. No, sir; I am not inclined to think that.

Q. Why not?—A. Because I think the other way.

Q. How long had you owned that property by that time?—A. My first title to it came, as I explained the other day, some time in the year 1864, or in the latter part of 1863.

Q. There had been nothing said about deeding this property to the asylum at the time you made this deed to Mr. Hildreth?—A. No, sir.

Q. You had not thought of it?—A. No, sir; I supposed at that time that it might be ultimately sold to a company at Norfolk for the purpose of a hotel.

Q. What was your arrangement with Mr. Hildreth as to the balance. It was worth more than $38,000, was it not?—A. Yes. I thought so.

Q. How was he to pay you the balance?—A. He was not to pay me the balance if I paid him his money. I have already told you that it was deeded to him for security.

Q. But it would be forfeited if you did not pay the money?—A. Yes, sir.

Q. Did you take a note or anything of that sort from Mr. Hildreth for the money?—A. The arrangement was reduced to writing, in the form of a communication to him.

Q. Have you a copy of that communication?—A. I have not.

Q. What business was Mr. Hildreth engaged in at that time?—A. The same business that he had been engaged in for a long time, that is, being a farmer.

Q. Where did he reside?—He resides in Massachusetts, in Lowell.

Q. I think you said the other day that you had paid $20,000, or deposited $20,000, for the purpose of clearing off the title of the property, besides the $12,000 you had originally paid?—A. Yes, sir, I stated that.

Q. When did you make that payment or deposit?—A. A year ago last September, I think; it may have been in August or July; it was in pursuance of a decree of the court.

Q. Of what court?—A. Of the circuit court of Virginia, for Elizabeth City County, wherein the property is situated.

Q. Did you pay the money to the court?—A. No, sir; I did not; I paid it into the hands of my counselor, Mr. Tabb.

Q. Twenty thousand dollars, precisely?—A. I will not say precisely; I think it was a little more.

Q. Do you recollect whether you paid it by check or in currency?—A. My belief is that it was by a check on New York; but it may have been by a check on Norfolk.

Q. Was there any other property involved in that transaction besides this particular property, which has been deeded to the asylum?—A. None.

Q. Do you own any other property in the vicinity?—A. I do.

Q. How much?—A. I think about two hundred or, possibly, two hundred and thirty acres of farming land.

Q. Did you buy that at the same time that you bought the asylum property?—A. No, sir.

Q. Is it near the asylum property?—A. A portion of it is about two miles off, and a portion of it within a mile.

Q. Did you buy it from the same parties?—A. No, sir.

Q. None of the same parties?—A. No, sir; I got that property by paying to some laborers in the arsenal, when they were sent away, the amount of their trust deeds which they had on this land.

Q. Can you state where Colonel Tabb resides?—A. Yes, near Hampton, Virginia.

Q. Did you receive back any of that $20,000?—A. Not a dollar; but I had considerable to pay.

Q. But you have not paid any more?—A. Yes; I have paid more in another direction.

Q. Be good enough to be particular, and state what other money you have paid and to whom; please state the precise amount.—A. As that other money was paid some two or three years ago, it is pretty difficult for me to recollect. It was paid to creditors and land-holders on this estate; I do not recollect their names.

Q. Did Mr. Hildreth give you the $38,000?—A. He did not.

Q. You never received it from him?—A. Yes; I received a portion of it, from time to time, as we went on with our negotiations.

Q. Have you received it all yet?—A. I think I did, and considerably more with it; and I have been able, by the sale of property, to reimburse him for that and other money which was due.

Q. But did you receive at any time altogether since that transaction $38,000, which he was to let you have?—A. He was to pay out in matters in which we were engaged certain moneys, and I received it in his account in that way.

Q. When the $50,000 was paid for the asylum property it was paid to him, all of it?—A. Yes, sir.

Q. And you did not receive a dollar of it?—A. No, sir; it passed into his hands.

Q. But he credited it to you, of course?—A. I hope so.

Q. Then you did at length receive the benefit of it?—A. O, I did; there is no doubt about that. If this examination was all to get at that fact, I stated it with frankness before.

Q. In regard to the Augusta matter, I think the written accounts show that $50,000 was paid for that property?—A. Forty-one thousand forty-one dollars and sixty-seven cents was the first payment, and $9,000 was paid some time afterward.

Q. Were there heirs, minor children, who had an interest in that property?—A. I do not know, but I believe there were. I believe that Mr. Beale, who owned the property, had some children. I understood, however, that the widow's title was by will. The title was very carefully examined by Mr. Baker, a lawyer in Augusta, and was certified

to us. A portion of the purchase money is still withheld until she relieves certain technical blemishes to the title.

Q. What agents of yours, if any, have paid out money for you on account of the asylum?—A. None, except my clerk, who is not an officer of the asylum. He has paid out some petty cash.

Q. Who is he?—A. Mr. Clancy, who was examined the other day. He kept the petty cash account for stationery, telegrams, &c.

Q. Has not Mr. Whitney paid out some money?—A. Nothing, except giving out a dollar, or two dollars, or three dollars, to some soldier, to sustain him for the time being, while waiting to get his papers.

Q. Has not Mr. Field, of Lowell, paid out money for you?—A. As my business agent, he has drawn checks by my direction, never on his own account.

Q. For money to send to the treasurers of the asylum?—A. No. When I had occasion to send money to various governors, or other officers of the asylum, I have written to Mr. Field, "You will fill out checks so and so," or "You will get certified checks from the banks so and so, and send them to such officers." That is all. I beg pardon; he bought about a thousand feet of leather hose for the asylum. I do not think of anything else.

WASHINGTON, D. C., *January* 21, 1871.

WILLIAM H. WEIGEL sworn and examined.

By Mr. FARNSWORTH:

Question. State your residence and occupation.—Answer. No. 156 Chatsworth street, Baltimore; clerk.

Q. State whether you have been acquainted with the National Asylums for Disabled Soldiers.—A. I have.

Q. What connection have you had with them?—A. I was commandant of the branch home at Rochester, New York, and for a few days I was commandant at the asylum at Augusta, Maine. I have also visited Dayton asylum onbusiness. I took a number of disabled soldiers from the New Jersey State home to the asylum at Dayton.

Q. When were you at Augusta in command as deputy governor?—A. I was in command at that home for twelve days, during the temporary absence of Major Cutler, the deputy governor. That was, I think, in February, 1869.

Q. What is the location of that asylum, is it good or bad?

(Objected to by Mr. Butler, and objection overruled.)

A. It is located, I think, some six or seven miles beyond the city of Augusta, in what I consider to be swamp land. In fact, while I was there, the place was flooded considerably and had frozen over. They had a steam engine at work there, pumping at different times.

Q. Is it a pleasant or unpleasant location?—A. It certainly was not very pleasant at the time I was in command there. There were some two or three feet of snow on the ground, and walking was very bad, particularly for disabled soldiers, some of whom had to walk to Augusta, not having the means for being conveyed there.

Q. Were you acquainted with the other officers there at that time?—A. Major Cutler was the only officer, except the doctor and the matron. I had left my place at Rochester, and was taking a lot of men from the New Jersey State home at Newark, to Dayton, and upon my arrival there I received a telegram from General Butler, president of the board, directing me to assume command during the absence of Major Cutler.

Q. The branch at Rochester was a temporary affair?—A. Only temporary.

Q. Have you ever visited the Milwaukee asylum?—A. I have not.

Q. Are you acquainted with the officers who have been in charge at different asylums other than those you have spoken of already?—A. I know Colonel Brown, who was in command of the Dayton home when I was there, and I know Colonel Woolley, who is said to be in command of the Milwaukee home now.

Q. Do you know Colonel Cassell, who was in command at Milwaukee?—A. I know a Major Cassell.

Q. Where did you know him?—A. I knew him as General Butler's provost marshal at Fortress Monroe.

Q. When was that?—A. When the general had command of the Army of the James, with his headquarters at Fortress Monroe.

Q. Where did you know Colonel Woolley?—A. I was associated with Colonel Woolley on General Lew Wallace's staff at Baltimore. He was provost marshal, and I was assistant provost marshal. He and General Wallace went to Texas on some special expedition, and I was left in charge of the provost marshal's office during his absence, for some three or four months,

Q. Do you know where Major Cassell now is?—A. I saw him in Washington a few days ago. I have seen him several times since I have been here.

Q. Of the officers who have been named, how many, and who were disabled in the

service?—A. Colonel Brown is the only one disabled to my knowledge. I never heard that either Woolley or Cassell was disabled.

Q. Do you know Dr. Crandall, the treasurer at Milwaukee?—A. No, sir; I do not.

Q. Do you think of any of the other officers who were disabled besides Brown?—A. I had heard that Major Cutler had received several wounds in the service. There is nothing in his appearance that would denote that he had been disabled.

Q. Neither Cassel nor Woolley were disabled?—A. Not to my knowledge. I never knew that Woolley was disabled, and I was with him day after day and night after night for many months, in Baltimore, in the same office. I never heard that he got near enough to the enemy's troops to get wounded or disabled.

Q. How was it about Cassell?—A. It is much the same about him.

Q. Was Cassell in New Orleans?—A. Not to my knowledge.

Q. Did you serve with General Butler?—A. I did.

Q. How long?—A. I joined General Butler in Annapolis, in 1861, before he came into Baltimore. I gave him some information in Annapolis which I think enabled him to make his movements on Baltimore. The night he arrived in Baltimore I met him and carried dispatches for him, at the risk of my life, to Fort McHenry. I remained with him during the time he was in Baltimore, and then, as my life was in considerable jeopardy, I wrote to the general and stated the facts to him, and he sent for me to join him at Fortress Monroe in 1861. I left him in New Orleans, I think in November, 1862.

Q. State whether, when you were at Augusta, you had any means of knowing of the purchase of that property; and if so, what you learned with reference to the purchase?

(Objected to by Mr. Butler as mere hearsay evidence, and objection sustained.)

Q. State what you know about it?—A. I have no personal knowledge on the subject, except from common rumor and report among the citizens of Augusta whom I met with during my stay there.

Q. In regard to the purchase of supplies for the asylum, what is your knowledge on the subject; how were they purchased, and by whom; was it fairly done or not?—A. The supplies purchased at Augusta, Maine, were all purchasd by Major Cutler, at least it was so reported there. I had no occasion to purchase any myself while I was there; but it was conceded that he was the agent for the purchases.

By Mr. NEGLEY:

Q. Conceded by whom?—A. Conceded by the business men whom he dealt with.

Q. Do you know whether the purchases were made for cash or on credit?—A. They had a pass book or several pass books on which articles were bought and entered. I cannot say exactly whether it was for cash. I saw the pass books being carried between the asylum and the town. There were some supplies bought, but whether for the matron or the asylum I could not say. I did not think there was much use for me there as commandant of the home; the matron seemed to command everything herself.

Q. You were at Dayton?—A. Yes, I was there a short time.

Q. State to the committee anything you know about the manner of conducting that asylum.—A. I know nothing at all about it, excepting correspondence which I had with one of the officers of the home while I was in command at Rochester, in which he complained of thieving going on there.

Q. Who was that?—A. Colonel Brown, the deputy governor. He complained that there was a good deal of rascality going on there.

Q. Do you know anything of the character of Major Cassell?—A. Only by reputation.

(Mr. Butler objected, but after some discussion he withdrew his objection.)

Q. State the reputation of Major Cassell.—His reputation by common report is very bad. I think that can be easily established by sending to Pittsburg, where he lived.

Q. Were you acquainted with what people said of him?—A. I have heard a good deal said of him. I was personally acquainted with him.

Q. Did you serve with him?—A. No, sir. He was provost marshal at Fortress Monroe while I was provost marshal at Baltimore.

Q. What was his reputation for honesty and integrity?—A. Very bad.

Q. What was his reputation as an officer?—A. His reputation at the time he was in the Army was very bad as an officer. When I say very bad I speak of the general reputation he had among officers and others who had business with him.

Q. That was in 1864?—A. That was in 1864, just previous to the time that the general was relieved of the command of the Army of the James.

Q. You stated that you were twelve days in Augusta.—A. Yes, twelve or fourteen days.

Q. You were there in midwinter?—A. Yes; in the month of February.

Q. When the ground was covered two feet with snow?—A. Yes.

Q. Was the ground covered with snow to that depth during the whole period you were there?—A. Yes, sir; it might have been more or less.

Q. How cold was it?—A. It was pretty cold. It was the coldest weather I ever

experienced in my life, save upon one occasion, when General Butler inspected a regiment or two of troops early in the war, I think in 1861, when I had an ear frost-bitten.

Q. During that time it was exceedingly difficult for the soldiers to visit Augusta?—A. Yes, sir; there was a certain number allowed to go in a conveyance, and others, who could not get into that conveyance, walked it.

Q. What was their object in visiting Augusta?—A. It was a privilege accorded them for their own pleasure.

Q. A furlough?—A. Yes, sir; for so many hours.

Q. They were at liberty to go, or not, just as they chose?—A. Just as they chose.

Q. You stated that the asylum ground was a swamp covered with water?—A. No, sir. I say that it appeared to be in swampy land, and a portion of the land was overflowed, and they were using a steam-engine to pump the water out.

Q. Were they pumping at the time you were there?—A. Yes. It snowed several days while I was there, and then, for variation, they had what they called a silver sleet, I believe, in which all the limbs of the trees and everything was covered with a coating of ice perfectly transparent. There was a very heavy fall of snow, and the ground was covered to a great deapth; more snow than we see in this latitude in twenty years.

Q. Do you know, of your personal knowledge, the purpose for which this property was used prior to its occupation as an asylum?—A. I simply know that there was a spring there, and that it was reported as having been a watering place. The water was said to contain some medicinal qualities.

Q. Did that spring cause the swamp you referred to?—A. That spring, I think, was the cause of the overflowing at the time.

Q, Was it a healthy locality at the time you were there?—A. I should think it was a healthy place in the winter time. I cannot speak of the summer, as I never was there in the summer.

Q. What was the percentage on the sick-roll?—A. I cannot tell without looking at the morning reports.

Q. What was the general condition of the inmates?—A. It was very good.

By Mr. FARNSWORTH:

Q. State whether, in consequence of the depth of the snow and of the inclemency of the winter there, it does not make it more like a prison than like a hospital?—A. It seemed so to me. I was very thankful when I got away; and some of the soldiers whom I brought with me from Newark begged very hard to be taken back; they did not want to stay there.

Q. This was an abandoned watering place?—A. That I do not know except from common report. It had been used, so common report said, for a watering place.

By Mr. BUTLER:

Q. Did you first communicate with General Farnsworth, or General Farnsworth with you?—A. I never had any communication with General Farnsworth until I was summoned. I did not know what I was summoned for.

Q. Have you been engaged in writing a series of articles against me in the Baltimore papers?—A. I have not written any articles against you in the Baltimore papers. I did write a series of articles for publication, as I wrote to you and informed you that I was going to do, but I did not publish them in the Baltimore papers. And now, inasmuch as General Butler has been to members of the committee outside, exhibiting extracts from these letters and trying to influence them, I want all the letters read.

Q. Do you know of your own personal knowledge that General Butler has visited any members of this committee for the purpose of influencing them by extracts?—A. Not from any personal knowledge of my own.

Q. Is that your handwriting? (exhibiting the word "commencement," written in pencil on the back of a paper.)—A. I think not.

Q. Do you swear it is not?—A. It does not look like my writing.

Q. Did you write that?—A. No, sir; I do not think I wrote that.

Q. Will you swear you did not?—A. I will not swear I did, and I will not swear I did not.

Q. You were appointed at the Rochester board at the request of General Martindale?—A. I think I was appointed by General Butler on my request to him for employment. General Martindale may have made a request to the president of the board.

Q. Is this paper your writing?—A. That is my writing. (The writing identified by the witness is an indorsement as follows: "Rochester Branch of the National Asylum for Disabled Volunteer Soldiers, Rochester, New York, September 5, 1868.")

Q. This was the case, was it not, that you went there to take charge of certain disabled soldiers who had been removed?—A. I was directed to proceed to Newark, New Jersey, to take a lot of disabled soldiers from there to Rochester, New York, which I did.

Q. And those others came on, and you took charge of them?—A. Afterward, during the period I was there.

Q. That and transporting soldiers to various asylums, and sending them into the country when they desired to go was your connection with the asylums?—A. Yes, sir.

Q. Have you ever been insane?—A. About as much as you have been, probably. I drink a little whisky, and have been under the influence of liquor.

Q. I ask you the simple question, have you ever been insane?—A. Not much.

By Mr. FARNSWORTH:

Q. You mean to say you have not been?—Yes, sir.

Q. State whether the inmates of the Augusta asylum were, or not, content with the place. What was thought of the place by the inmates of the asylum?

(Objected to by Mr. Butler, and objection sustained.)

Witness was allowed to examine the inside of the paper indorsed "commencement," and, having examined it, he said: I sent that paper to General Butler, but I do not know whether I wrote the word "commencement" on it or not. I sent that paper to him.

By Mr. SLOCUM:

Q. Just as it is in the shape it is now?—A. I cannot say. The printed matter was pasted in. I pasted it in myself.

By Mr. FARNSWORTH:

Q. Do you wish to make any explanation about it as to why you sent it?—A. No explanation at all. I simply thought that General Butler might be pleased to see this thing, and to put it in the scrap-book.

HENRY A. FERNALD, sworn and examined.

By Mr. FARNSWORTH:

Question. State your residence and occupation.—Answer. Milwaukee, Wisconsin; druggist.

Q. Have you been in the employment of the board of managers of the Asylum for Disabled Volunteers?—A. I have, by appointment of the deputy governor.

Q. Where?—A. At Milwaukee, Wisconsin.

Q. What deputy governor appointed you?—A. John Cassell.

Q. When did you receive your appointment?—A. I was there from about December, 1869, to the 1st of September, 1870, I think.

Q. What was your position?—A. Druggist for the asylum, under the surgeon.

Mr. BUTLER. You mean hospital steward?

WITNESS. That is the designation by the officers of the asylum, but I call myself a druggist.

Q. What was your business?—A. Putting up prescriptions, attending to the sick, the immediate superintendence of patients received and patients discharged, taking care of the books, and making the daily, weekly, monthly, and quarterly reports.

Q. Who were the other officers?—A. At the time I entered there were John Cassell as deputy governor, Dr. James H. Thompson as surgeon, and the chaplain's name was Mr. Turner; W. H., I think.

Q. Was there any treasurer there?—A. No, sir; the surgeon performed the duties both of surgeon and treasurer.

Q. Were any of those officers disabled?—A. Of those officers I knew of none disabled, except Dr. Thompson who was disabled with neuralgia, or a similar complaint—some affection of the head.

Q. Incurred in the service?—A. I believe so. I know that frequently he had very sudden attacks.

Q. Was Cassell disabled at all?—A. Not that I am aware of; he always appeared a very hearty, stout, able, man.

Q. Have you resided in Milwaukee since that time?—A. Yes; I have been there twice since.

Q. What other officers of the asylum, either there or at the other asylums, have you known?—A. I have known General Tilton, who was colonel of my regiment in the field. Maine was my native State, but I served in a Massachusetts regiment. He was never disabled that I know of. I also knew General Ingraham, I think; Chaplain Earnshaw, and Major Thomas, of the Dayton asylum. These two last named were in the Dayton asylum. And I also knew the late appointees at Milwaukee; these were General Woolley, who was a very fine man; Dr. Crandall, the treasurer; Dr. Towle, the surgeon, and Colonel Ludwig, the chaplain. He is the only disabled officer that I know of at Milwaukee. I am inclined to think that General Woolley is disabled in some way, but I do not know.

Q. Of all the officers of those asylums whom you have known, how many have been

disabled, to your knowledge?—A. There is first Colonel Ludwig, chaplain of the Milwaukee asylum; the next is Dr. Thompson, of the Milwaukee asylum, and Colonel Brown, of the Dayton asylum. These are all that I know who are disabled. Of course I am not acquainted with all of those officers.

Q. Have you ever been at the Augusta asylum?—A. No, sir.

Q. You know nothing about it of your own knowledge?—A. No, sir; not of my own personal knowledge; I have circumstantial evidence in connection with it.

Q. Of what character?—A. I have evidence communicated to me by persons who are to be relied upon, and who have personal knowledge of the facts.

Q. State from whom you received information.—A. From Private Sidney D. Russell, who used to be sergeant major of the Maine asylum, and from Dr. James H. Thompson, who was recently called to Maine by reason of the illness of his mother, and who, while there, examined the records of Augusta asylum.

Q. Dr. Thompson was the surgeon in charge of the Milwaukee asylum?—A. Yes, sir.

Q. Is he now at Milwaukee?—A. He is now at Milwaukee, in private practice.

Q. Whom is he doing business with?

(Objected to by Mr. Butler, and objection sustained.)

Q. Who is Dr. Wolcott?—A. Dr. E. B. Wolcott is surgeon general of Wisconsin, a member of the board of managers of the National Asylum, and a surgeon in practice in Milwaukee.

Q. At the time that Thompson was surgeon in charge of the hospital at Milwaukee, was Wolcott one of the board of managers?—A. Yes, sir.

Q. Do you know anything about Dr. Thompson being discharged?—A. I do.

Q. Do you know why he was discharged?—A. Not from my personal knowledge.

Mr. BUTLER. He was discharged by resolution of the board.

WITNESS. I only know from General Butler's own writing.

Q. Did you see that?—A. Yes, sir.

Q. Was Cassell there at the time that Thompson was discharged?—A. Yes, sir; and for months afterward.

Q. Was there any difficulty between Cassell and Dr. Thompson?

(Objected to by Mr. Butler, and objection sustained.)

Q. Are you acquainted with the reputation of Colonel Cassell, who was deputy governor there?—A. Yes, sir.

Q. What is his reputation, good or bad?—A. His reputation is very bad, indeed.

By Mr. COBB:

Q. State what you mean by reputation; do you mean what the soldiers said about him?—A. No; I mean what C. West & Co., of Pittsburg, Pennsylvania, say of him; and what they say of him is the result of an investigation of their books when he left their employment two years ago.

Q. You base your opinion upon that?—A. Partly, and from his conduct at Milwaukee.

Q. State to the committee if you are acquainted with his general reputation where he is known among officers with whom he has served, or at the asylum where he has served, or where he has resided.—A. Within the limits of the asylum and the city of Milwaukee it is not favorable to Colonel Cassell. Proceedings of the board of managers in March last, I think, will reveal that.

By Mr. BUTLER:

Q. Were you present at the meeting of the board?—A. No, sir.

By Mr. NEGLEY:

Q. This reputation which you speak of, so unfavorable to Colonel Cassell, was it brought to your attention after he became an officer at the assylum or prior to that time?—A. It was after.

By Mr. FARNSWORTH:

Q. You did not know him before that?—A. No, sir.

By Mr. NEGLEY:

Q. You say that Major Cassell was discharged from the duty to which he was assigned there?—A. I did not say that; I say that he left there.

By Mr. FARNSWORTH:

Q. Do you know anything about the manner in which the assylum is conducted and the supplies purchased? If so, state it.—A. In reference to supplies I know nothing.

Q. Do you know anything as to the manner of conducting the asylum?—A. Yes.

Q. State anything you know about it.—A. I know that at the time Colonel Cassell was there, and during the time I was there, soldiers were brought up many times for being drunk and absent, and were simply told not to do that again. There was a general laxity of discipline. There were three or four months at the time that the men could not get clothing; there was nothing to be had. Colonel Cassell said that he

could not get any; that he had sent his vouchers to General Butler, and in various directions, (I presume he meant to the Quartermaster General's Office, because he told me so himself,) and he could not get supplies of clothing. There was no conveyance between Milwaukee and the asylum, four or five miles, except as he might please to send in a team. The surgeon would often make a request for a disabled man to be allowed to go to town, to look after his pension or something else, and nine times out of ten it would not be granted.

By Mr. BUTLER:

Q. When did you come to this city?—A. About six weeks ago.

Q. When were you summoned?—A. I was summoned by letter on the 17th of January, and by subpœna on the 19th.

Q. Whose letter came to you to summon you here?

(Witness objected, but was directed by the committee to answer the question.)

A. General Farnsworth's.

Q. Had you written him previously?

(Witness again objected, but was directed by the committee to answer the question.)

A. Yes, sir; I wrote to General Farnsworth about it.

Q. Desiring to appear before the committee?—A. No, sir.

Q. Stating facts which you knew or would tell?—A. If I answer that question correctly, it will involve me in a direct negation of the previous one.

Q. Direct negation of what?—A. It will belie me in the previous question, if I answer that one correctly.

Q. You mean to say that, if you answer this question correctly, it will show that you lied in the previous one?—A. Certainly.

By Mr. FARNSWORTH:

Q. Explain what you mean by that; what do you mean by saying to the committee that, if you were to answer that question correctly, it would involve a contradiction of the other?—A. I meant that, if I answered it truly, as General Butler put the question, I would be belying my own words.

Q. What do you mean by that?—A. He asked me whom that letter was from, and I told him General Farnsworth. He asked me if I replied to it, and I told him yes.

Q. He asked you if you wrote to me desiring to come before the committee?—A. Yes.

Q. What do you mean by saying that, if you were to answer that question correctly, it would involve you in a contradiction?—A. Because I had private business here.

Q. State what you wrote to me.

(Objected to by Mr. Butler, unless the writing was produced.)

Q. Did you in your letter to me desire to be brought before the committee?—A. No, sir.

Q. What did you mean by saying that, if you answered that question correctly, it would contradict something else?—A. It does not relate to the subject at all, I think.

Q. What does not relate?—A. My reason for refusing to answer does not relate to the subject before the committee.

Q. You were asked by General Butler if you wrote to me asking to be brought before the committee?—A. Yes.

Q. And in reply to him you said you could not auswer that correctly without involving a contradiction of something else; did you mean that?—A. Certainly I did.

Q. What would it contradict; you did not write to me asking to be brought before this committee?—A. Certainly not. I wrote that I might be a witness and could produce evidence.

Q. That you knew something about it?—A. That I could give names which would furnish evidence.

WASHINGTON, D. C., *January* 26, 1871.

General EDWARD W. HINCKS sworn and examined.

By Mr. BUTLER:

Question. You were in the war as an officer?—Answer. Yes, sir.

Q. Held what position?—A. I entered the service 26th of April, 1861, as second lieutenant United States cavalry. I was mustered into the service April 30 as lieutenant colonel Eighth Massachusetts Volunteers, and as colonel of the same regiment the 16th of May following; as colonel of the Nineteenth Massachusetts Volunteers 3d of August, 1861; brigadier general of volunteers November 29, 1862. These are all the volunteer commissions I held during the war.

Q. You received a commission by brevet?—A. I was brevetted major general the 13th of March, 1865.

Q. After the war were you appointed by the board of managers as acting governor of a national asylum?—A. I was appointed, I think, in July, 1866.

Q. At that time had the board of managers selected any sites for their asylums, to your knowledge?—A. They had not.

Q. State whether an advertisement was made for offer of sites in various papers of the United States.—A. I saw advertisements in the papers.

Q. Some time in the latter part of the summer of 1866, were you directed by me to do anything about the site of the asylum which was afterward located at Augusta; if so, state succinctly what was said and done by you?—A. I should not be able to give the exact dates. I speak from memory. I think in August or July, 1866, I received instructions from General Butler, president of the board of managers, to visit all the places that had been offered in answer to the advertisements, and make investigation as to their desirability or fitness for the purpose offered, ascertain the value or estimated value of the several locations, and make report. I did so. Either while I was making the investigation or immediately afterward I was directed by General Butler to see Mrs. Mickell, who was the reputed owner of an estate which had been offered at Togus Springs, in Maine, which I had previously visited. He directed me to make a more special or minute investigation as to its fitness, and, if it could be purchased at a reasonable sum, to secure the refusal of the property. I saw Mrs. Mickell at the Parker House in Boston. She told me about what the property would be sold for. Her husband was also present. It was arranged that we should go down to Augusta by the boat that evening, so that I could make a more minute investigation of the property. We did so. I obtained what I thought was an agreement she would adhere to for the purchase of the property, though it was not in writing. I think it was at the price of $60,000. I reported to General Butler, who said to me that $50,000 was the maximum amount he would consent to pay for that property. Afterward I revisited the property, together with Governor Smythe, of New Hampshire, and Mr. Gunckel, of Ohio, governor of the board of managers for that asylum. They approved of the purchase of the property, and I renewed negotiations with Mrs. Mickell, and finally induced her to sell the property for $50,000, with the additional agreement, which she insisted upon, that the board would take what personal estate there was upon the property at a fair valuation.

Q. Such as what?—A. It was the product of the farm the season before; and among the rest there was in the vicinity of three hundred tons of hay, one hundred and twenty-five of which was English hay pressed for the market, and one hundred and fifty or seventy-five wild meadow hay; potatoes, probably two or three yoke of oxen, carts, plows, and other agricultural implements, the schedule of which I think was forwarded to the board of managers. I preserved no copy myself. The agreement which was finally consummated between Mrs. Mickell and myself was consummated during the month of October, 1866. Much delay was occasioned by her evident disinclination to part with the property. There was a memorandum of agreement entered into between us which was, as near as I can recollect, that the board of managers would purchase the estate for the sum of $50,000, conditioned upon their furnishing a complete title to the property; and that the State of Maine, by its legislature next to assemble, should cede jurisdiction over it; and with the further stipulation that in case the purchase of the property was not consummated by any fault of the board of managers, we should pay $1,000 per month rent while it was actually occupied, it being considered very desirable at the time to have the place open for the reception of inmates before the setting in of cold weather, and therefore necessary that possession of the property should be secured as tenants if we did not become the purchasers. And if negotiations should fail to be consummated by reason of the jurisdiction not being ceded by the legislature of that State, or any fault not to be charged to the board of managers, we were to pay $500 a month while it was actually occupied; and we further stipulated that if the negotiation was not consummated by any fault of the owners, we shoud have a period of rent of either six months or one year, I am not certain which, without cost; my impression is that it was six months, and to carry us through the winter.

Q. Please describe the property and its value as near as you can.—A. The property was one which belonged to Mrs. Mickell, the title having been invested in her by her first husband, from whom she had been divorced, and married to a second husband, Mr. Beals: the first husband was a large contractor under the Government, as I was informed. It consisted of about a thousand acres of land, or something in excess of a thousand, which was taken at a thousand more or less, located, the center of it, about five miles from the center of the city of Augusta, Maine, and about two and a half miles from the city limits. Just previous to the war, Mr. Beals had erected upon it a hotel as a summer resort. As near as I can judge at the present time, the main building of the hotel was about 60 feet square, and five stories high. It had an L projecting southward 75 feet by 40, four stories high; another L 30 by 45, four stories high, and the third L 20 by 30, perhaps, with various halls for the several flights. I state these dimensions from my general impression, and do not expect to be exact. There was a stable well built, and finished thoroughly inside and out, carpeted and painted, I should say about 80 feet by 45, with a cellar beneath, divided into compartments for keeping stock. There was a bowling-alley occupying the second story of a building about 80

feet long, with sufficient width for two alleys, beneath which were finished rooms used, originally, as servants' rooms. These buildings were all new and were adapted to the accommodation of about four hundred guests, as guests are usually accommodated in hotels. There was besides a farm-house that had previously been a hotel, and stage-house, containing some sixteen rooms, perhaps; a smaller house containing six rooms, and four barns. There was also a mineral spring upon the estate which possessed some chalybeate qualities as well as magnesia, and over it a spring-house. There was also an ice-house. The estate was well fenced, as farms are usually fenced in the eastern country, with post and rail; about three hundred acres of the land was capable of tillage, and when I took possession of the estate it was mostly in grass, the product of the land being, upon the estate, as I have said, about three hundred tons. The balance of the land was as good as the average pasturage in the State of Maine, with the exception of about fifty acres, which was in second-growth wood, as the expression is used.

Q. Had Mr. Beals undertaken to improve the land by setting trees and making walks and paths?—A. Yes; there was a race course laid out upon it, in the center of which trees had been planted in great variety occupying the whole center of the course. And there were regular walks laid out about the hotel to the spring, and down to a point in the center of the estate, which were skirted by trees that had been planted as ornamental trees. There was an orchard of about five acres of young fruit trees, inclosed with a stone fence.

Q. Did you learn in your investigation there what amount had been expended upon the new buildings?—A. I had no authoritative statement of the cost of the buildings, though in the inquiries I made I was informed by intelligent residents of the vicinity, who were employed by Mr. Beals to work upon the buildings, that the cost of the new buildings exceeded $100,000, and that Mr. Beals had expended a vast amount of money in the improvement of the estate, of which this was a part. The place was called "Beals's Folly." He had expended about a quarter of a million upon it; certainly not less than $200,000, and I would not undertake to make the improvements which were there for that amount of money. I will state in reference to that an incident which occurs to me just at this moment. When I appeared before the judiciary committee of the legislature, representing the necessity of obtaining possession of or jurisdiction over the estate, the town of Chelsea, in which the larger part of this property was located, appeared by selectmen and counsel in opposition to the prayer of the petitioners, upon the ground, as they alleged, that it would take $75,000 worth of taxable property out of that town. I remember that Mr. Hale, a present member of the House from that State, and Mr. Fay, a member of the next House, were members of that committee; of which Judge Shepley was chairman.

Q. Did you close the negotiation, and upon what terms?—A. I did, at $50,000 for the estate, and $5,500 for the personal property. The agreement was that we should take it at a fair valuation. I was at that time sinking cellars, putting in heating apparatus into the building, and was employing intelligent farmers in that vicinity. I called upon some of the most intelligent of them to make a fair valuation of this property, except the hay, and I finally agreed to take it at twenty-five per cent. less than their valuation. I fixed the terms of purchase of the hay myself, at one dollar a ton less than the market valuation upon the streets of Augusta at that time.

Q. Why was that $1 deducted?—A. Because it was estimated that it would cost $1 a ton to transport the hay which was upon the premises to Augusta. I could make these terms with the owners, and I made them. They could sell it on the streets of Augusta at $1 more than I gave. I think the price at that time in Augusta was $20. In two weeks it was $25, and so continued to the end of the season; and I could have sold the hay at twenty-five per cent. advance as a private speculation if I had been inclined to do so.

Q. I see it stated in the newspapers that General Farnsworth will prove before this committee that of the $50,000 paid for the purchase for this estate, only $30,000 was ever received by the owner of the property. I wish to ask you if any agreement, expressed or implied, existed on your part for any other price than the $50,000 named?—A. Never. It was the lowest possible price I could induce the owners to part with the property for. It was only by repeated assertions that I would have no dealings with any other than the actual owners of the estate, that I obtained it at that price. They were desirous of dealing through some third party. I do not know who he was; but I repeatedly told them that if they wished to negotiate through some other party, I would consider the negotiations broken off; and I finally induced Mrs. Mickell to come to the terms I offered.

Q. Will you state whether there were any incumbrances upon the place in the shape of judgments or mortgages?—A. There were.

Q. What arrangement was made as to the title?—A. The arrangements were that the negotiation should fail, unless a complete title to the property should be presented to the acceptance of the counsel of the board of managers, Mr. Baker.

Q. Who is Mr. Baker?—A. He was an attorney-at-law living at Gardner or Hallowell, Maine.

Q. About how far from the asylum?—A. About five miles.

Q. Do you know whether he made that certificate of title?—A. I do not.

Q. Did you, after you made the negotiations, take possession of this estate, as governor of it, and proceed to make such changes as were necessary to adapt it to the uses to which it was intended?—A. I did.

Q. Was that done under your own supervision and in your own way?—A. Under my own supervision; I will state that I attempted to make contracts for the necessary alterations and repairs, but I could find no parties who were willing to make the contract and give bond for the completion within the given time, and I thereupon undertook to do it myself by hiring day labor, which I did without difficulty from the residents in the vicinity, and had the whole work done under my own supervision. I attended to it day and night until it was completed and in running order.

Q. Did you, soon after you began these alterations, commence to receive soldiers there?—A. I did on the 10th of November.

Q. How long did you remain there as governor of the asylum?—A. Until the 6th of March, 1867.

Q. Why did you leave then?—A. I had previously resigned my position and asked to be relieved from the care of the institution for the purpose of joining my command in the Army, to which I had been appointed in the re-organization of the Army.

Q. What was your position?—A. Lieutenant colonel.

Q. When did you leave there?—A. The 5th or 6th of March, 1867.

Q. Where was your command at the time you left?—A. In Washington.

Q. Did you come here directly?—A. I came directly here.

Q. When you got here, did you see any one connected with this purchase?—A. I came here and stopped at the National Hotel. Mr. Mickell, the husband of the lady who owned the property, called upon me the evening I arrived, or the morning following—March 8, 1867.

Q. Do you know whether I was in Washington at that time?—A. You were stopping at the Kirkwood House.

Q. For what purpose did Mr. Mickell call to see you?—A. I could not state for what purpose. His card was sent to my room, and on my invitation he came up.

Q. Was Mrs. Mickell with him?—A. She was not then.

Q. Did you see Mrs. Mickell?—A. Not at that time.

Q. How soon after?—A. If he called in the morning, it was that day; if in the evening, it was the day following; it was within twenty-four hours. Among other things he asked me to go with him to General Butler's, or to go with Mrs. Mickell to General Butler's and to obtain a payment for this property which had been purchased in Maine.

Q. Did you do so?—A. I did within a short time, I think—the morning following, probably—the 8th or 9th of March, 1867; I went with her and saw General Butler at the Kirkwood House.

Q. Did you leave her there, or did you remain with her?—A. My impression is that I escorted her back to the Metropolitan Hotel, where she was stopping.

Q. Did you learn from her whether she obtained payment for any portion of the sum?—A. I know a check was passed while I was there, and she stated to me that she obtained $40,000.

Q. Did you then go to your command?—A. I did.

Q. Have you seen Mrs. Mickell since?—A. I have not seen her since that occasion in Washington. I may have seen her after that transaction.

Q. How was that location at Togus' Springs as to health?—A. It was considered very healthy. I made many inquiries of practicing physicians, with whom I consulted in Augusta in regard to that point, as I did of the other places I went to investigate.

Q. Was that one of the places you were ordered to investigate?—A. It was. This was considered a very healthy location, and my own opinion confirmed that report when I came to reside there.

By Mr. FARNSWORTH:

Q. When did you first visit that estate?—A. I think in July, 1866. It was either in July or August.

Q. Was the hotel then open?—A. It was not.

Q. Had it been closed all that summer?—A. It had been all that summer.

Q. How long since it had been opened as a hotel?—A. My impression is they had boarders the year before, but not a large number.

Q. It never paid?—A. I think not.

Q. It was a failure as a hotel enterprise?—A. Yes.

Q. The buildings were of wood and such as are usually constructed for summer watering-places?—A. No, sir; it was built far superior to any watering-places that were advertised which I visited.

Q. What were the walls?—A. It was a heavy frame building. The walls were boarded and plastered on the inside, and then lathed and plastered over that, and clapboarded on the outside. The building was furnished throughout with large win-

dows, plate glass, and covered with blinds. It had a cupola upon the top and a great many ornamental trimmings.

Q. Do you know whether there was an insurance upon it while you were there?—A. There was a condition in the articles of agreement that the owners should keep the buildings insured to the amount of $25,000 until the negotiations were consummated.

Q. Were they kept insured after you took possession?—A. I never effected any insurance upon them myself.

Q. When did you consider the bargain consummated; was it before you took possession?—A. I considered the bargain consummated when the cession of jurisdiction was made by the legislature. So far as the managers were concerned, they were bound to take the property or pay a thousand dollars a month rent for twelve months upon the owner furnishing a good title.

Q. Farming lands are comparatively cheap in Maine, are they not?—A. Yes, sir.

Q. You were there during the winter of 1867?—A. Yes; until the 6th of March.

Q. Did you find it a comfortable place to live?—A. I enjoyed myself there very much; Maine is my native State, and I find it a comfortable State to live in.

Q. There are pretty deep snows there?—A. Very deep that winter—so much so that I found it difficult to drive to town. There were four feet of snow in the highways that winter—a very unusual circumstance.

Q. It was very difficult for the soldiers to get out of the building?—A. It was, and I congratulate myself on that fact while I was there, because they were inclined whenever they went to town to get drunk.

Q. Still the asylum was not intended as a prison?—A. No, sir. I furnished them with every means of occupation, recreation, and enjoyment at home, but I found an inclination on the part of most of the men who came there when they could come in town to get drunk.

Q. Can you tell the committee the general character of the soldiers who were the inmates of that asylum?—A. I should say it was far below the average character of soldiers in the Army.

Q. Can you state to the committee what percentage of these were American-born and what percentage foreign-born?—A. I would state that of those we had the winter I was there the larger portion were natives of the State of Maine. There was not a large foreign element there. Shortly after I left I was informed that a large number came from Philadelphia; these I know nothing of.

Q. Mrs. Mickell is residing where?—A. My impression is in New York.

Q. You have had no further connection with the asylums?—A. None whatever.

Q. Can you state to the committee how much you expended in fitting up the property while you were there?—A. I cannot; my impression is not far from $12,000.

Q. How was the money furnished you—in what manner or shape?—A. I think the first money I received from General Butler was on a draft made by myself upon him for the sum of $5,000, to pay small bills. I paid these bills, taking vouchers in triplicate and sending the duplicate vouchers to General Butler, president of the board of managers. Then perhaps the next draft I made upon him was for $4,800 in part payment for the personal property. Not having sufficient funds on hand for the whole, I drew upon him for that amount. I think the next was a draft upon him for the payment of a bill for plumbing furnaces and things of that sort; my impression is for the sum of $6,000.

Q. You received all your remittances by drafts upon him in that way?—A. I remember, in the case of the plumbing, that I sent him the vouchers and received a draft in return. I think that is the only bill that was paid directly by General Butler. Generally, I drew upon him in gross, taking vouchers in triplicate, as I have said, retaining the triplicate copy for the records of the institution, and furnishing General Butler, president of the board of managers, with duplicates. I think I drew something like $20,000 from him in this way. I do not undertake to state that as the correct amount; but it approximates to it.

Q. Have you never been there since the property was burned?—A. I never was.

Q. You do not know how it has been built up?—A. I do not.

Q. Did you send your drafts directly to General Butler or to the officers of the board?—A. I sent them directly to him. I usually drew at six days' sight, notifying him of the fact that I had drawn upon him, and I usually received the reply that an agent of his, by the name of Field, in Lowell, had been instructed to place that amount to my credit. That was the usual course; there may have been exceptions.

Q. Who were the other officers that were in charge of the asylum at Augusta during the time you were there?—A. There was a young man, by the name of Nathan Cutler, who I employed as secretary, specially in charge of the records of the institution; a sergeant, by the name of Bowman B. Breed; and my brother, whom I employed to take charge of the stock and farm, he being a farmer by occupation.

By Mr. BUTLER:

Q. Was Nathan Cutler a disabled soldier?—A. He was. Governor Samuel Cony, of

Maine, came to me and stated that he was a young man, a major of a Maine regiment, who had been severely wounded, and had suffered for a long while in one of the rebel prisons, rendering him very feeble in health. I asked him to bring the young man to me at Augusta. He did so. He made, at the time, some objection to taking the position, on the ground that his health was so poor he did not feel able to discharge his duties. It was evident that he was in very poor health. My brother was shot through the lungs while in the Army, his right shoulder-blade injured so as to render his right arm useless. Still, being an energetic man, accustomed to farming, I considered him worth the $800 a year, which I paid him to take charge of the operations of the farm. I desired him to be there to assist me.

Q. State whether you yourself have been disabled?—A. I consider myself a healthy man. It is well known that I have been severely wounded—I suppose as thoroughly wounded as any man in America.

Q. State in what way.—A. I was shot through the thigh on the retreat of McClellan's army to the James River, while leading my brigade against a corps commanded, as I afterward learned, by Richard Anderson, a rebel general. Both bones of my right fore-arm were fractured in the battle of Antietam while in command of my brigade, shortening my arm a little and leaving my right hand in a condition that until now I have never been a moment free from pain. In the same action a bullet struck me in my right vest pocket, passed through my body anterior to the spine, opening the intestines and knocking off the lateral process from the left side of the spine, exposing the spinal cord and lodging in my belt. I passed whatever I ate for weeks through that wound, having no natural passage. I am unable to ride on horseback or to endure any severe fatigue, or any strain upon the spinal column.

Q. You have since been retired from the Army on account of these wounds?—A. I have. I received other injuries, but these are the principal ones. My general health at the present time when not exposed to fatigue is very excellent; but I suffer from neuralgia in the back at all times; I have never been free from it.

Mr. Butler laid before the committee the following papers:

No.—. $9,000. WASHINGTON, *March* 20, 1868.

At sight pay to the order of Mrs. J. A. Mickell, nine thousand dollars, value received, and charge same to account of National Asylum.

[STAMP.] BENJ. F. BUTLER.

To D. C. G. FIELD, Esq.,
Lowell, Mass.

(Indorsed:) Accepted, March 24, 1868. Benjamin F. Butler, draft, $9,000. Paid March 27, 1868.

LOWELL, *March* 24, 1868.

[By telegraph from Washington, March 21.]

To D. C. G. FIELD:

Have drawn on you at sight for nine thousand ($9,000) favor Mrs. Mickell.

BENJ. F. BUTLER.

NEW YORK CITY, *No.* 355 *West Twenty-third Street.*

DEAR SIR: I wrote to you some weeks since in reference to the money you kept back on the purchase of Togus estate for Government, but have as yet received no answer. As all matters have been cleared up, and three years have sped, you will oblige me by sending a check for the balance. You recollect the money, by a letter I hold from you bearing date 1870, was to be paid over one year from that time. Hoping this will meet your approbation, and I shall hear early from you,

Respectfully,

MRS. J. S. MICKELL.

General BUTLER.

BAY VIEW, *August* 24, 1870.

Indorsement on Mrs. J. S. Mickell's letter dated New York, August 17, 1870, *asking for the balance of purchase-money for Togus*:

Respectfully referred to Colonel Nathan Cutler. May I ask you to ascertain whether, in fact, all the doubts on the title of Mrs. Mickell are removed? There were some pieces of land that I understood could not well be removed, and had not been removed. You would know more about it than anybody else except, perhaps, Mr. Baker. Please do me the favor to inform me on this subject.

BENJ. F. BUTLER.

LOWELL, *September* 29, 1870.

MADAM: Immediately on the receipt of your previous letter I referred it to Colonel Nathan Cutler, asking him to have the records searched, to see if everything was all right in the title of the Togus property. He has not reported to me since that time, and therefore I have not been able to answer you. While I regret the delay, I do not think I am to blame for not answering you before.

Yours truly,

BENJ. F. BUTLER.

Mrs. J. S. MICKELL,
355 West Twenty-third Street, New York.

WASHINGTON, D. C., *February* 3, 1871.

CHARLES A. RAYMOND sworn and examined.

By Mr. FARNSWORTH:

Question. State your residence and occupation?—Answer. I reside near Hampton, Virginia. I have been collector of internal revenue, and am now acting, at the request of the board of managers, as manager of the asylum.

Q. How long have you resided near Fortress Monroe?—A. Thirteen years.

Q. What was your occupation immediately preceding the war?—A. I was president of the Chesapeake female college there.

Q. Is that the property now occupied as an asylum?—A. It is.

Q. Did you own any interest in that college?—A. I was one of the original purchasers of it in 1859.

Q. What interest did you own?—A. One-eighth.

Q. How many persons were owning it at the breaking out of the war?—A. Eight.

Q. Who were the others?—A. Mr. Hume, of Portsmouth, Virginia; Mr. Armestead, of Portsmouth, Virginia; Morris & Gwathney, of Portsmouth, Virginia; William J. Wright, of Nansemond County, Virginia; Mr. Dennis, of Norfolk County, Virginia; Mr. Cox, of Norfolk County, Virginia, and Mr. Saulsbury, of Norfolk.

Q. Were you all equal owners?—A. Equal owners of one-eighth.

Q. You were president of the college?—A. During its whole existence.

Q. Had you a clear title to the property?—A. No, sir; the title was in the court of chancery.

Q. What do you mean by that?—A. The property was sold under a deed of trust, or foreclosure of mortgage, and instead of paying the money to the commissioners who sold the property, it was paid into court in order that it might be paid out under a decree of the court.

Q. When was that?—A. In 1859, after we purchased it. We purchased it at a commissioner's sale, under a deed of trust. The title we never did receive. When we came forward to pay for the property and to receive our title, the commissioners refused to receive the money and to pay the various liens upon the property; and it was thrown into chancery in order that, by decree of the court, the various creditors might be paid, and we might get a clear title through the court.

Q. Did you ever get a clear title?—A. No, sir; the war broke out within two years.

Q. How much were you to pay for the property?—A. It was a cash sale. We were to pay $33,400.

Q. How much did you pay?—A. Our attorney had actually paid about $22,000.

Q. How long did you occupy the property?—A. From 1859 to the beginning of the war. The payment was not completed when the war broke out. There had been an order of the court issued that, on payment of the purchase money, the title should issue from the court. We were paying off the purchase money when the attack on Fort Sumter stopped all operations.

Q. What was done with the property after the war broke out?—A. It was taken by the Government as a hospital, in September or October, 1861.

Q. Did you remain there after the war commenced?—A. I left there immediately after the first Bull Run battle, about the 20th of July, 1861, and returned again in July, 1864.

Q. Meanwhile the Government was in possession of the property?—A. It was in possession of it until June, 1869, I think.

Q. The Government had been in continuous possession up to that time?—A. Yes, sir; the Government had taken it for a hospital.

Q. Had the Government erected any buildings on the property?—A. Some wooden barracks—temporary buildings.

Q. Did the Government pay anything for the use of the property?—A. Never a cent, to my knowledge.

Q. How did it leave the property?—A. In rather a dilapidated condition.

Q. Did it not repair and fix it up?—A. No substantial repairs—rather superficial repairs, cleaning, whitewashing, and painting. It did not suffer very much from the use.

Q. What became of the buildings which the Government put up on the property?—

A. They were taken down and turned over, some of them to the Freedmen's Bureau, and some to the quartermaster of the post.

Q. When did you sell this property?—A. Four of the owners sold in the latter part of December, 1864.

Q. Which four?—A. Those living in Norfolk and Portsmouth; Mr. Cox, Mr. Saulsbury, Mr. Dennis, and myself.

Q. Did you make the bargain?—A. With them I did. I stipulated to convey my interest afterward.

Q. To whom?—A. To General Butler.

Q. Did you make the bargain for yourself and in behalf of the other three?—A. I made the bargain for General Butler. I was then on duty there.

Q. On what duty?—A. I was acting as superintendent of education, and as chaplain of the Army. General Butler detailed me for that purpose, to organize and conduct a system of free schools for white children. We had about two thousand children there, and I superintended them.

Q. What did those parties receive for their interest?—A. Twelve thousand dollars at that time.

Q. Did each receive $3,000?—A. No sir. They were paid *pro rata* according to the amount of the purchase money which each had paid, or of the liens they had on the property. Mr. Saulsbury received, I think, about $1,800; Mr. Dennis received about $2,000 or $2,200, and Mr. Cox received about $6,500, which exhausted the $12,000 up to within about $60.

Q. Where is Mr. Cox?—A. At his residence near Portsmouth.

Q. Why did he receive more than the others?—A. He had paid in more. The arrangement was that they were to receive in proportion to what they paid, and to their claims against the property.

Q. It was a half interest in the property that these four gentlemen had?—A. The three and mine would have made the half interest in the property.

Q. For that you received $12,000?—A. For the three shares $12,000.

Q. And your share?—A. That was not arranged at that time. It was not settled.

Q. How much did you own in it?—A. I owned what the others did; but all had not paid in an equal amount.

Q. How much of the $12,000 were you entitled to; as much as Mr. Cox?—A. No, sir; I had not paid in as much as Mr. Cox. I think I had paid in about $2,000 in money, and there was about $3,000 due me.

Q. Do you not receive anything for your interest?—A. I did not sell at that time.

Q. Did not General Butler buy the interest of four of the stockholders at that time?—A. No, sir; I think only of three. My own share was never mentioned between us in any way.

Q. Have you ever sold your share since?—A. No, sir; it has been extinguished.

Q. Have you ever received anything for it?—A. No, sir.

Q. How has it been extinguished?—A. We were all on a joint and several bond for $32,000, the amount of the original purchase money, of which $20,000 had been paid, and the interest on the remainder had been accumulating during the war. As an inducement to them to sell out I offered to let them take my share. So I never have received really anything for my share.

Q. And you have no bargain to receive anything from any source?—A. No, sir; not from any source.

Q. Over $20,000 had been paid on the original purchase money?—A. Yes; there was a balance of $12,000 due which, with the ten years' accumulated interest, made $17,000 or $18,000 due on the bond.

Q. You made this trade with General Butler in 1864.—A. Only for those three shares.

Q. Did you agree with these three men to give up your share?—A. No, sir; there was no agreement.

Q. What was done with the interest of the other four parties?—A. An agreement was made with them some time in 1869, or in the first part of 1870.

Q. What agreement, and with whom?—A. I do not know. I cannot answer of my own knowledge.

Q. Was their interest purchased?—A. I suppose so. Beyond the spring of 1869 I cannot tell you anything about the property.

Q. Do you know anything of the purchase from the other four stockholders?—A. Nothing except from hearsay.

Q. Have you heard from them?—A. No, sir.

Q. Have you seen any deeds from them?—A. No, sir.

Q. Did you make any bargain with them on the part of General Butler or anybody else?—A. No, sir. I made them a proposition at three several times, but did not complete any bargain with them.

Q. You do not know that they have sold it now?—A. Not of my own knowledge but from hearsay.

Q. You do not know but that they still hold the title?—A. Not of my own knowledge.

Q. Have you no bargain, no contract, written or parol, express or implied, that you shall have any pay for your interest in the property?—A. The thing has been so indefinite that I do not know. The "implied" may cover a good deal of ground. I offered them to say nothing about my own interest if they would dispose of their interest and wind up that bond.

Q. Do you say to the committee that you never have received any consideration for your interest?—A. I do say that.

Q. And you say that your interest in the property was as great as that of the others? A. It was the same as the others.

Q. And that you acted as the agent of General Butler for purchasing from the other three in 1864?—A. I did so by his order.

Q. Order or request; were you under his orders?—A. I was under his orders, and the understanding at that time was that this was not altogether a private matter. The understanding was that the Government wished the property.

Q. Did they make deeds directly to General Butler?—A. They made an assignment of all their right, title, and interest—a quit-claim.

Q. Did you join them?—A. No, sir; they sold individually.

Q. You never conveyed any title, or made any quit-claim or release, or anything of that sort?—A. No, sir.

Q. Were you a party to any suit instituted afterward in reference to the settlement of the title to the property?—A. Not that I know of. My name may have been used. I never was consulted in regard to it.

Q. You never had any process served on you?—A. I think not. I do not recollect that I ever had.

Q. If you were a party to any suit it was without your knowledge?—A. It was without any consultation with me, and I do not know that I was.

Q. How much of this property did the other three parties sell?—A. They sold their interest in the undivided property. There are forty acres in the property.

Q. The same that the military asylum now holds?—A. Yes.

Q. That was the amount of your original purchase?—A. Yes.

Q. Has the asylum purchased any additional ground?—A. Not to my knowledge.

Q. Are you now the superintendent of the asylum?—A. I was requested in August last by the president of the board of managers to aid gentlemen who went down there, and I have aided them to the best of my ability, devoting most of my time since to the asylum.

Q. In what position?—A. simply as a friend of the parties, without any title.

Q. Are there inmates in that asylum now?—A. There are now between forty and fifty inmates. They came a week ago on Sunday night. About the 1st of January I received an appointment making me the acting deputy governor and treasurer.

Q. And you have no knowledge as to how the title of the other four parties to this property was extinguished?—A. I have no actual knowledge. That is, I had nothing to do with it. I never saw a paper or writing on the subject. I have had no communication with them. I had my own business to attend to and made no inquiry. I was glad to have the bond extinguished.

Q. Do you know whether that bond is paid up?—A. I do not know it.

Q. Do you know that it is not?—A. No, sir; I know nothing at all about it.

Q. Your name was not taken from the bond?—A. No, sir.

Q. Did you receive any bond of indemnity?—A. No, sir.

Q. Any writing?—A. No, sir.

Q. Did you take up that bond?—A. I did not. The purchaser of the remaining shares it was supposed would take it up. I know nothing whatever of the title or of the property after this arrangement was made.

Q. Then you abandoned your interest in the property and received no indemnity against the payment of the bond nor any release of any kind?—A. I agreed to say no more about it provided the bond was extinguished.

Q. And you received not one cent?—A. Not one cent in any shape or form.

Q. And do not expect it?—A. I do not expect it. I was glad to get rid of paying the balance due on the bond.

By Mr. BUTLER:

Q. This Chesapeake College was an incorporated institution?—A. Yes.

Q. And the eight partners, as you call them, were stockholders?—A. Yes.

Q. How long before had the building been erected?—A. The building was completed sufficiently for occupancy in November, 1857; but it was not completed until the winter of 1859–'60. The photograph here is a very good photograph of its appearance as it was a year ago. There is, besides, a large cottage house of ten rooms, which I occupy, the building of which cost about $6,000. The other photograph is a good picture of one part of the grounds.

Q. What other buildings were there on the property in 1864 other than the Government buildings?—A. The cottage house of which I speak, a brick building 36 by 48 feet, used as an hospital, the main college edifice, and a cottage of six rooms under the willow tree, and stables and out-houses.

Q. In its original inception it was found to be a losing speculation, and got into the courts from non-payment of its debts?—A. Yes, sir; it turned out so in consequence of the war. It was originally owned by another stock company which failed, and we purchased it at the sale of their effects.

Q. And the question of the lands was being settled in court when the war came on?—A. Yes.

Q. The eight stockholders had interests according to the amounts they had paid in and the debts which they claimed to be due to them from the property?—A. Yes, sir.

Q. You have lived in that cottage house since 1864 without rent?—A. Yes, sir; since October, 1864.

Q. State about what the main building cost originally.—A. I have always been told by the builders that it cost $65,000. I was not there when it was built.

Q. Did you make inquiries of the builder at the time you were thinking of purchasing it?—A. Yes, sir; we made minute inquiries, so far as to get the actual number of brick in the walls of the building.

Q. And in reply to those inquiries, you got the information as to the cost of the building which you have stated?—A. Yes.

Q. Were you present at an appraisement of the building made by the Quartermaster's Department at the time they turned it over?—A. I was not present. I think I was mentioned as one of the board, but I was absent at the time the appraisement was made. I was informed by the board of the result of the appraisement. They appraised the building itself as it then stood at $35,000. That was in June, 1869. They appraised simply that building as it stood.

Q. Did you have any negotiation with General Schofield with reference to the Government purchasing this property as a part of the artillery school at Fortress Monroe?—A. While General Schofield was there he called upon me one day to ascertain from me concerning the title to the property, its condition, &c. As the result of the conversation, he offered to give $8,000 a share for the property, for each of the eight shares, provided the title could be made good to the Department. He said his object was to have it taken as a light artillery school, and that he should consider that a fair valuation of the property.

Q. Did he, as commander of the Department of Virginia at that time, occupy that point?—A. He was occupying it at that time as his headquarters.

Q. Did he pay any rent for it?—A. He never paid any rent for it, to my knowledge.

Q. Do you know of any purchase of land adjoining it, by the Government, for any purpose?—A. Yes; there is a national cemetary within a stone's throw of it, divided from it by a narrow stream of water, 40 or 50 yards wide.

Q. What did the Government pay per acre for that land?—A. I know it only from hearsay. I was told by one of the parties in interest that the Government had paid $1,000 an acre.

Q. Was that land as desirable, or would it sell for as much in the market, as the land on which the asylum is situated?—A. Oh no, sir.

Q. What should you say would be the difference, in market value, of the two lots of land?—A. I received an offer myself, in 1869, for a part of the college land. I was offered by a gentleman from Norfolk, on behalf of himself and ten others, $1,000 a lot, for lots 45 or 50 by 80 feet, to be situated anywhere on that college property, to be selected by himself. They wanted to purchase lots there for summer residences.

Q. Compare the value of the college land and of the land sold to the Government for a national cemetery, and say what would be their relative worth.—A. The college land would be more than double in the market.

Q. How close is it to the normal school erected by the American Baptist Missionary Society?—A. The two buildings are within five hundred yards of each other. The properties adjoin, with the exception of a narrow stream.

Q. Is there at Hampton Creek water for wharfage accommodation on this property?—A. Yes, sir; at the extreme point that you see in the photograph. There was formerly a wharf there.

Q. For the purpose for which it is used, what, in your judgment, would be a fair value for the property?—A. I should not think it had depreciated in value since we owned it, and we always held the property at $100,000.

By Mr. FARNSWORTH:

Q. And yet you were glad to get rid of your interest in it for nothing, for the sake of getting rid of your liability for the balance of a $32,000 bond, $20,000 of which had been paid?—A. I was liable for the whole amount due on the bond. It was a joint and several bond.

Q. And you were glad to give away your interest in a property that you think was worth $100,000?—A. I was willing to do so.

Q. Do you think that that is consistent testimony?—A. I do.

Q. General Butler has testified that, in his opinion, this property was worth $300 an acre, and you swear that you think it worth $1,000.—A. I did not swear any such thing.

Q. Do you think his opinion correct that it was worth $300?—A. I know it is worth more than that.

Q. Did you ever know any considerable amount of property there to be sold for more than that?—A. Yes, sir; this identical piece of property, when it was in a wild state, and before any buildings were put upon it, sold for more than that.

Q. That was when they had wild-cat speculation down there. They expected then to have a watering place there.—A. It was before that time. I was offered, by Colonel Mallory, $1,000 an acre, cash, for the half of that land last year, not including the buildings. So that I think I have reason to say that I know it was worth more.

Q. And yet, even up to 1869, you were glad to get rid of your interest in it?—A. I was glad to get rid of my liability for the balance due on the bond.

Q. And you do not know that you are rid of it now?—A. I have every reason to think that I am.

Q. What have you to show for it?—A. I have nothing to show for it, but I have been told by my attorney, who completed the transaction, that I was clear.

Q. You have no papers to show for it?—A. Not a scrap; only that my attorney told me that the bond was extinguished.

Q. Did it seem to you exactly fair that you should pay one of your colleagues $5,000 or $6,000 for his interest in the property, and that you should give your interest for nothing?—A. No, sir; it was not equitable or right. I never considered that it was fair, but we had got used to losses during the war. There was no such stress in 1864 as there was in 1869, when we made the final trade. That was the time I relinquished my right.

Q. Is not that the very time that you have been swearing the property was worth so much?—A. I did not swear it was worth so much in 1869.

Q. When did you swear that a man offered you $1,000 an acre for a part of it?—A. In 1869.

Q. How many acres?—A. I think about five.

Q. And you think that the whole of it was worth the same rate?—A. No; I do not think that every acre of it would have been.

Q. Yet, at that very time, in 1869, you were anxious to get rid of your property for nothing?—A. I was very anxious.

Q. When you could sell it for $1,000 an acre?—A. A part of it I could sell for $1,000 an acre.

Q. Where have you stayed in Washington, since you have been here under subpœna?—A. At the Ebbett House.

Q. Have you had any conversation with General Butler about this investigation since you came here?—A. Not more than for three minutes.

Q. Do you know that you did have three minutes' conversation about it?—A. Not about the investigation; but only to ask him when we could come before the committee. If you mean to ask whether I spoke to him about the nature of the investigation, I answer never a word.

Q. You were asked, if you occupied a house on the property till 1869 without paying rent?—A. Yes.

Q. You did not get rid of your interest till 1869?—A. No, sir; I have lived there since the war, and have taken general charge of the property.

Q. Without any salary?—A. Certainly, without any salary.

Q. No salary?—A. Not a cent.

Q. You gave away your property and stayed and took care of it without salary?—A. If I had time to explain, I could very easily explain all that.

Mr. FARNSWORTH. I should be very happy to hear the explanation.

Mr. NEGLEY. The committee does not desire to hear it, as not being relevant to the case.

By Mr. NEGLEY:

Q. You say that there was some $17,000 due on the bond, including interest, in 1869. Were there any costs?—A. Not at that time.

A. Were there any other debts against the property which you would be bound to pay?—A. Yes, sir; about $10,000 of personal debts, which would have been made liens against the Government.

Q. And you were the responsible party for all that indebtedness?—A. I was responsible for a considerable part of it. I was one of the responsible parties.

By Mr. BUTLER:

Q. You were bound to pay, if others did not?—A. Yes; we were all wealthy men at

the time the property was purchased, but during the war most of them lost their property.

By Mr. NEGLEY:

Q. And you accepted, as a consideration for your interest, the being relieved from that indebtedness?—A. Yes; I gave my interest to the others; I tried very hard to get them to sell their interest.

By Mr. FARNSWORTH:

Q. You say there were other debts against the property. What debts were they?—A. There were some debts for supplies for the college.

Q. Can you tell how much, and to whom?—A. About $10,000; I do not know that I can tell to whom; we had a steward who made all the purchases. I know that there was $3,000 due to me for my salary.

Q. You gave that up?—A. No; but I might as well. My salary was to have been $3,500 a year.

Q. You do not expect to get what is due to you?—A. No; I have given it up in that sense. There were debts for furniture and for groceries; I do not know the amount.

Q. You, being the president in charge of the college, directed the steward?—A. No, sir; the steward was responsible to the board of trustees.

Q. You do not know how much the college owed?—A. Yes; but I do not know all the parties to whom we were indebted.

Q. Have you no papers to show?—No; I never had; the papers were in the steward's hands, and are still.

Q. Who is the steward?—A. He lives in Portsmouth. He sold out his interest the same as the others did. The floating debt has not been adjusted to this day; a large part of it is held by the parties who owned the property, and they assigned it with their other interest; they assigned all their interest.

THOMAS TABB sworn and examined.

By Mr. FARNSWORTH:

Question. State your age, profession, and residence.—Answer. My age is thirty-five; my profession is that of a lawyer; my residence in Hampton, Virginia.

Q. General Butler has stated that you were the attorney who conducted some suits in relation to property purchased for a soldiers' asylum near Fortress Monroe.—A. I was.

Q. State what the character of the suit was.—A. The property now known as the Soldiers' Asylum there was, prior to the war, called the Chesapeake Female College. It was purchased by a number of gentlemen in the interest of the Baptist denomination. Finding that they could not complete the purchase by reason of want of means, it was conveyed to Messrs. Mallory & Herndon as trustees. In the mean time certain parties had acquired a priority of lien, both by deeds of trust and by judgment, on the property. The property was sold at public auction by Messrs. Mallory & Herndon, the trustees. This was in 1858 or 1859. It was bought by a gentleman named Vaughan, a very zealous member of his church. Vaughan, finding that he could not comply with his purchase, went to Mr. Hume, of Portsmouth, Mr. William J. Wright, a gentleman named Morris, and a genleman named Cox, and induced some of them to take the property off his hands. The property was sold at public auction for $32,400. That was not enough to pay the liens on the property and the creditors of the college. These trustees then filed a bill in the circuit court of the county of Elizabeth City, convening all the creditors before the court in order that they might establish their priority of liens, and that the court might decree the distribution of the purchase money. The purchasers paid some part of the purchase money; not the whole of it, however. When the war came on a large part of the purchase money was still due. They had paid off some of the liens. After the war ended the liens on the property that were due to creditors under the original sale, amounted to between $18,000 and $19,000. In the mean time General Butler had bought out three of those parties, named Cox, Dennis, and Saulsbury, who conveyed to him their interest in the property. for $12,000 in the aggregate. I think the deeds were made to Mr. Raymond, and were subsequently conveyed by him to General Butler, and Dennis, I think, had not paid any of his part of the purchase money. Saulsbury had only paid a portion of his; but Cox had paid nearly all of his. Then it was that my connection with the matter commenced. The old suit was still pending in the court. No deed had been made to the purchasers. I examined the papers and found that General Butler was in this position; that, in my opinion, those parties who had contributed to the purchase money, which had been paid, could subject the interest which he had bought and paid for, to the payment of their proportion of that sum. I thought that his purchase there was in serious jeopardy. It was then essential, I thought, in order to General Butler's protection, that he should get the whole property. The general put the matter in my

hands, and asked me to get the property for him. I opened negotiations with the owners, went up to see them, and told them that I desired to purchase the whole property for General Butler. They wanted to know how much I was authorized to give. I told them I was authorized to give the original purchase money, subtracting from it the amount which General Butler had paid to Dennis, Cox, and Saulsbury—$12,000—not taking into consideration any interest which had accumulated. I had very great difficulty with them. They estimated the value of the property at $75,000 or $80,000, and said they thought they could get that much for it. The persons I speak of were Hume, Morris, Armestead, and Wright.

Q. They were all together?—A. Yes, I had them summoned specially to meet me at Norfolk. My first interview resulted in nothing. I told them that if they put the figures at anything like that, it exceeded my authority, and I broke off all negotiations. A judgment would have issued against these parties for the amount due on the bond, about $19,000, on the expiration of the stay law in Virginia, which was then approaching its end. These parties, without any further communication from me, wrote to me in the course of some weeks, saying that they desired to open negotiations again. I went to see them, and succeeded in purchasing the property from them. They conveyed their interest to General Butler, giving a general warranty deed. That was in the fall of 1869. The matter was still pending in the court. General Butler furnished me with the means, and I paid off the liens as reported by the commissioner. The record had been destroyed during the war. The suit was revived, and General Butler was made a party to it, inasmuch as he had purchased out the interest of Dennis, Cox, and Saulsbury in 1865. I paid off the liens, and reported the fact to the court. I filed General Butler's answer, stating that he had paid off these liens, and desiring to be substituted in place of the purchasers. Mr. Raymond, however, came in. Whether he was one of the original purchasers or not I cannot say, but he was connected with Cox, Saulsbury, and the others. His interest I did not buy. The record did not show that he had any interest in the property, although I knew of my own knowledge that he was connected with the others. These parties claimed that Mr. Raymond had transferred his interest to them: and inasmuch as I was perfectly satisfied with their deed warranteeing the property, I was willing to take it on those terms. I applied to the court and asked a dismissal of the suit, and that a deed be made to General Butler. Mr. Mallory was then the surviving trustee, and Mr. Mallory and myself were ordered as special commissioners of the court to execute the deed.

By Mr. BUTLER:

Q. How much did you pay off for me on those liens?—A. That property has cost you, I think, about $40,000, including the interest.

By Mr. FARNSWORTH:

Q. How much has he actually paid; twelve thousand dollars in the first place?—A. Yes.

Q. And how much through you?—A. About $23,000.

Q. Was that paid into court?—A. I paid the liens as reported by the commissioner of the court, and the balance of the money after the liens were paid I paid over to these parties.

Q. General Butler stated in his testimony that he paid about $20,000 to you.—A. More than that. General Butler sent me a draft for $18,000, and I had some matters on hand for him on which I realized $3,000 or $4,000 more.

Q. On what bank was that draft?—A. He authorized me to draw on a gentleman in Lowell, Massachusetts, for $18,000.

Q. What was the name of that gentleman?—A. I think his name was Kearney.

Q. Can you give the committee the precise date of that?—A. No, sir; I cannot. Subtracting $12,000 from $32,400, I was to pay them the balance, less the amount necessary to pay off the liens. It is proper to state that the property cost more than $32,400, because I paid the insurance on the property, which amounted, I think, to some $500 or $600; and I expect, of course, to get a reasonable fee for the services I have rendered in the matter.

Q. Did you receive any more than the $18,000 draft?—A. All the money he ever gave me was $18,000. The balance of the amount I received from *choses* of General Butler's which I had in my hands for collection—about $3,400.

Q. Then it was $18,000 and $3,400?—A. Yes.

Q. And that is the amount which has been paid?—A. Yes; and the $12,000 and the insurance on the property.

Q. And the bargain was consummated in the fall of 1869, you think?—A. I think it was.

By Mr. BUTLER:

C. How long have you lived in Hampton, Virginia?—A. I was born there and have lived there all my life, except during the war.

Q. Your house was how far from this property?—A. I do not think I resided more than three-quarters of a mile from it.

Q. Were you in the confederate army during the war?—A. Yes, sir; I was.

Q. And are now a practicing lawyer in Hampton?—A. Yes, sir.

Q. Please tell me if you know of the sale of land to the Government, since 1869, adjoining this property?—A. Yes, sir; I do. I am not certain, however, whether the sale took place since 1869 or not. I presume you have reference to the national cemetery; that property is between my place and this national asylum; it was used for a national cemetery, and the owner of course claimed compensation; he claimed it, under the law, through the district court of the United States at Norfolk—Judge Underwood's court. The price of that property was fixed, by assessors appointed by the court, at $1,000 an acre, and he received $5,000 for those five acres.

By Mr. FARNSWORTH:

Q. It was already used for a national cemetery—the graves already there?—A. They were there at the time he sold the property.

By Mr. BUTLER:

Q. Suppose both pieces of land had been in open market, what was the relative value of these five acres compared with the asylum?—A. I can only speak relatively. The asylum property in 1852, that is, the land before the building was put upon it, sold for $10,000. The whole farm upon which this national cemetery is now located sold, at a date subsequent to that, or very close to it—a farm of one hundred and fifty or sixty acres—for, I think, $11,000.

Q. Compared with the five acres, or the whole farm, what would you say was the relative value of the two places?—A. There is no comparison between the two locations; in point of soil they are about the same; but the location upon which the asylum stands is infinitely superior; one acre of the asylum property would have sold for five times that of the cemetery.

Q. You have known this property ever since the buildings were erected?—A. Yes, sir.

Q. What, in your judgment, was its fair marketable value at any time within the last year for a clear title?—A. I am no judge of that matter; I can only say that at the time I was negotiating the purchase of the property I asked the opinion of mechanics about it. A gentleman in whom I had great confidence told me that the buildings could not be put there for less than $50,000. I am told there are a million brick in the buildings; I do not pretend to speak accurately. I know this—that every one who had anything to do with this property before it was sold sunk a great deal of money in it.

Q. The next adjoining farm is the Segar farm?—A. That lies immediately contiguous to this place.

Q. What is that held for? Are you one of the commissioners appointed to sell that place?—A. I am.

Q. Was any portion of that place offered to the Government?—A. Yes, sir; the whole of it has been offered to the Government.

Q. Did the Government enter into a contract to take it, subject to the ratification of Congress?—A. Yes.

Q. For how much an acre?—A. I think for $200.

Q. That is, for the four hundred acres?—A. Yes, substantially; probably three hundred and ninety-five, or something like that.

By Mr. FARNSWORTH:

Q. Congress did not ratify it?—A. No, sir.

By Mr. BUTLER:

Q. Has it ever been before Congress?—A. Mr. Segar gave me a paper in which there was a recommendation for reference of the matter by the Secretary of War to Congress; this was twelve or eighteen months ago.

Q. Is the location of the asylum property desirable?—A. Yes, sir; I should think so; very.

Q. Was the question of title submitted to you?—A. Yes, that question was submitted to me.

Q. State whether, from your knowledge in regard to it, the asylum has a good title to the property?—A. I think the title is perfect; the only question is just this: a portion of the property upon which the asylum stands belonged to a gentleman from Philadelphia, who sold it to Mr. Segar. There was a lien upon the property for a certain amount, which he would not release. The owner of the asylum property did not want the whole place upon which this lien rested, and they had to take the whole of that lien in order to get the amount they wanted. There is now about $1,500 due upon that lien, which is upon a part of this property; but, at the same time, it is a lien upon three times its amount in property contiguous to it. So that I gave my opinion that

the title was perfect, for the reason that if an attempt were made to enforce the lien we would have no difficulty in selling land enough, outside of this, to pay it.

By Mr. FARNSWORTH:

Q. Was the unoccupied land worth any more at the time its purchase was made than it was when the farm was sold in 1852?—A. There is no standard of comparison. The value of land depends entirely upon its location.

Q. For farming purposes is it particularly valuable?—A. No, sir; it was never particularly valuable for farming purposes; they were merely fancy prices.

Q. The town does not grow very much?—A. Yes, there is more business done there now than there was before the war.

Q. More than there was at the close of the war?—A. The town was entirely destroyed during the war.

By Mr. BUTLER:

Q. Did Judge Bond go down and consult you about the title of this property?—A. Yes, sir; I regard this title as good as it can be.

By Mr. FARNSWORTH:

Q. Judge Bond was referred to you by General Butler, was he not?—A. I do not know by whom he was referred.

Q. He knew that you had been an attorney in regard to it?—A. I do not know. He came into my office one day, representing himself as a lawyer from Baltimore city, who had come to investigate that property, and asked me if I could give him any information in regard to it. I took him up to the clerk's office; he made what examination he desired, and was perfectly satisfied with the title.

"HAMPTON, VIRGINIA, *February* 6, 1871.

"GENERAL: I have the honor to inclose to you the exact date of my transactions as attorney for General Benjamin F. Butler in the matter of the Chesapeake Female College, and now the Military Asylum, near this place. I informed the committee I could not speak with minute accuracy as to dates and amounts, unless I made reference to my books and the records of the court.

"The date of the contract purchasing the property from Messrs. Hume, Morriss, Armistead, and Wright was the 9th June, 1869. General Butler had previously, viz, 14th January, 1865, purchased the interest of Messrs. Cox, Salisbury, and Dennis in the property. By the agreement made the 9th June, 1869, General Butler was to give $34,200, less $12,000, which he had paid to Cox, Salisbury, and Dennis. By this contract he was to pay off the liens before the expiration of the stay law in Virginia; and the balance of the $22,200, after the payment of the liens, he was to pay to Messrs. Hume, Morriss, Armistead, and Wright within four months; which was afterward modified to four months from the 15th September, 1869; that being the first term of our circuit court, at which the whole matter could be ratified by decree of court in the suit then pending in regard to the property, and which was accordingly done on the 27th October, 1869, being a special term of our circuit court, there having been no court at the regular time, viz, 15th September.

"I also inclose a statement of the liens and disbursements. You will see they amount to the sum of $22,662 43, some three months' interest having accrued upon them. By the terms of the contract of the 9th June the interest on the liens from that date was to be paid by General Butler. Of this sum of $22,662 43, it is proper to state that $18,821 63 was paid to discharge the liens, $468 70 for insurance; $3,340 was paid to Messrs. Hume, Morriss, Armistead, and Wright, being the balance due to them after the satisfaction of the liens, as of the 9th June, 1869; and the balance, $32 10, for stamps, recording, &c.

"On or about the 20th September, 1869, I drew, in obedience to instructions from General Butler, upon a party in Lowell, for $18,000. I cannot ascertain the precise date, nor the name of the party, but I am very positive his name was Carney, and I find the amount of the draft placed to my credit in the Citizens' Bank, Norfolk, as shown by my bank-book, on the 29th September, 1869. The remainder of the money was realized from the collections made upon bonds due to General Butler from parties in this locality.

"I stated in my examination that the property cost General Butler about $40,000. My meaning was, that it stood him about that sum at the time he parted with it.

"January 14, 1865. Paid Cox, Salisbury & Dennis	$12,000	00
Interest on $12,000 for five years and six months	3,930	00
Amount paid by me, as per statement rendered	22,662	43
Interest on $22,662 43, say for six months	379	87
My fee	750	00
	$39,752	20

"As I gave in my testimony in some degree of haste, being desirous to leave Washington, and not having had an opportunity to read it over, it is possible that there may be some errors; if so, and any member of your committee, or General Farnsworth, or General Butler, should desire any explanation of any statement in it, I would be glad to give it.

"I am, general, very respectfully, your obedient servant,

"THOMAS TABB.

"General JAMES S. NEGLEY,
"Chairman Sub-Committee of Military Affairs."

FISHER A. HILDRETH sworn and examined.

By Mr. FARNSWORTH:

Question. State your age, residence, and occupation.—Answer. Fifty-two; farming is my business; I reside at Lowell, Massachusetts.

Q. You have been spending the winter in Washington mostly?—A. A part of it.

Q. You are a brother-in-law of General Butler?—A. I am; he married my sister.

Q. Are you acquainted with the property at Fortress Monroe used for a soldiers' asylum?—A. I have seen it.

Q. You know that it is now being occupied for a soldiers' asylum?—A. I suppose so. I have not been there since during the war.

Q. Were you there on duty during the war.—A. I was not; I went down there two or three times on matters of business. I had some affairs at home of General Butler's.

Q. Did you ever own this property?—A. I held it. The legal title was in me.

Q. When did you receive the title?—A. Some time during the past summer, I think.

Q. Can you give the date when you received the deed precisely?—A. I cannot.

Q. Did you deed it to the board of managers of the asylum?—A. Yes, sir.

Q. Do you know when you deeded it?—A. I cannot give the date of the deed.

Q. How long after you received the deed yourself before you deeded it over to them?—A. My impression would be, though I cannot undertake to give dates, that I received the deed during the summer, and deeded it to them in the fall, or very early in the winter.

Q. Can you by any means refresh your recollection so as to be able to state what month you received the deed?—A. Not unless I could see the deed.

Q. Where were you when you received it?—A. In Lowell.

Q. Was Congress in session?—A. I cannot state positively that it was.

Q. Was General Butler at home at the time you received it?—A. He was. I think I received the deed from him at Lowell. That is my present recollection. I know I gave the deed at Lowell.

Q. Where were you when you gave the deed to the board of managers?—A. In General Butler's office in Lowell, I gave the deed to him.

Q. That is, you handed it to him: it was not made out in his name?—A. I handed it to him; it was made to the asylum; I gave the paper into his custody.

Q. Was that before the commencement of this session of Congress?—A. Yes, sir.

Q. Can you tell how long before?

(General Butler here produced the deed referred to before the committee, bearing date October 17, 1870.)

Q. Did you receive the consideration of that deed—$50,000?—A. No, sir.

Q. You have never received it?—No, sir; I never received $50,000.

Q. Did you receive anything?—A. Yes, sir.

Q. How much did you receive for the deed?—A. I advanced to General Butler.

Q. How much did you receive?—A. I received what I had advanced. I think I had advanced altogether about $12,000, which General Butler repaid to me.

Q. The consideration for the place went to him then, and he paid you?—A. Yes, sir; I had made other advances to General Butler.

Q. But you received $12,000 at the time you handed him the deed?—A. No, I believe I had received a little of it back from General Butler before that time; at any rate, it was about the time. I received it at two or three different times. I received his check for $5,000 or $6,000. I received $2,500 in money, and between $5,000 and $6,000 in money.

Q. Did you draw the money on that check?—A. I did.

Q. That was at the time you gave the deed?—A. No, sir; it was after I gave the deed.

Q. Do you say you advanced $12,000 at one time?—A. No, sir; not all at one time.

Q. Between what times?—A. Between May, when he wrote me from here, and the time, or immediately after the time, of my giving the deed. I had advanced it before and received it between these times.

Q. Received the letter from here what about?—A. He wished to pledge his Hampton property to me for advances.

By General BUTLER:

Q. Have you that letter?—A. I have.
Q. Please produce it?

Witness laid before the committee the following letter:

"WASHINGTON, *May* 10, 1870.

"MY DEAR HILDRETH: I have occasion to borrow some money of you for which I desire to pledge my Hampton property in Virginia. You may be able to reimburse yourself by a sale hereafter; but whether that is so or not, I think it will be good for the amount. I will forward you the deed in a few days, and will then make arrangements with you for the money when I can place the security.

"Yours, truly,

"BENJAMIN F. BUTLER.

"F. A. HILDRETH, Esq."

By Mr. FARNSWORTH:

Q. How did you learn how much you were to advance?—A. I learned from him that he wanted about $38,000.

Q. Did he write again on receipt of your letter in answer to yours, or how did you learn?—A. I learned from him at home.

Q. After Congress adjourned?—A. Yes, sir.

Q. Then from May 10th until the middle of July you heard nothing about it, and he then told you how much he wanted?—A. I think that may be so. At the time he came home he told me how much he wanted.

Q. And then gave you the deed?—A. I think it was then.

Q. Upon making the deed did you give him the advance?—A. I think not; I do not remember the specific time. I trusted the matter entirely to him. I did not, so far as I was concerned myself, care anything about the deed at all.

Q. You were ready to make the advance upon his personal security?—A. I was; but it was rather his choice to give the deed.

Q. And you say that when he gave you the deed you did not make any advance of money?—A. I am not certain; I would not be positive whether I did or not.

Q. Did you tell him you would not take the deed?—A. I think he had already made it. I told him I cared nothing about it.

Q. Did you send it down for record?—A. He had done that himself. He did all the business.

Q. Did you ever receive that deed in your possession and keep it in your possession?—A. I did not keep it, I think. I received it.

Q. It was shown to you and you gave it back?—A. It was shown to me and I think it was already recorded. I would not be positive about that. I paid very little attention to it. It was a matter I cared very little about.

Q. He got it recorded, then showed it to you, but you did not keep it?—A. I did not keep it; I would not say positively that it had been recorded.

Q. You made no advance of money at that time?—A. I may have done; I do not think I did at that time.

Q. Did you make any advances from that time to the time you deeded the land over to the asylum?—A. Yes; I made advances to him amounting to about $12,000 between the time of that letter and the time I made the deed.

Q. That was after the time you got the deed?—A. Yes.

Q. Do you know what you made advances for?—A. I do not know what he wanted he money for.

Q. And you do not know in how many installments you made it?—A. I think about three.

Q. How much at each time?—A. I would not undertake to give the sums.

Q. How did you make these advances—by your check?—A. I think by my check or in cash.

Q. Are you sure which?—A. I am not; if I had the money in my pocket I would give it to him; if I had not I would give him my check.

Q. Did any of the board of managers tell you they wanted to purchase this property before you deeded it over?—A. No, sir; I do not know that they did.

Q. Did you have any conversation with any of them except General Butler about it?—A. No, sir. I wrote a letter to Judge Bond, I think, offering the property for sale. This was at General Butler's suggestion.

Q. Who answered that letter?—A. I never received an answer.

Q. It was laid before the board as you were informed, were you not?—A. I suppose it was. I think General Butler told me so.

Q. And when you were told by General Butler to make the deed you made it?—A. Yes, sir.

Q. And that is all you had to do with it?—A. Yes, sir.

By Mr. BUTLER:

Q. Up to the time you received the letter had you heard anything about the asylum having anything to do with this property?—A. I had not.

Q. After you received the deed were you and I in negotiations with the expectation of carrying on some considerable purchases which might call for money?—A. We were.

Q. Was anything said to you when I gave you the deed as to why it was given?—A. You stated that there might some difficulty occur in regard to suits down there, and that you would rather have it in the name of somebody else than yourself.

APPENDIX G.

Major General JOHN S. NEGLEY,

Of Committee on Military Affairs, House of Representatives, United States:

In answer to your inquiries, I have the honor to report that the land for the Central Branch of the National Asylum for disabled volunteer soldiers, was purchased through a committee appointed at a public meeting of the citizens of Dayton, and from the persons and at the prices following:

The tract of James Crosby, 80 acres, at	$12,000
The tract of Philip Rike, 75 acres, at	9,000
The tract of Abraham Roseberry, 80 acres, at	11,500
The tract of Elizabeth Roop and others, 100 acres, at	10,700
The tract of Mary R. Stansell, 10 acres, at	1,250
The tract of Hiram Stansel, 10 acres, at	1,250
The tract of Elizabeth Coles, 8 acres, at	1,100
The tract of Abraham K. Burtner, 30 acres, at	3,600
Being 393 acres, at	50,400
Of which sum the citizens of Dayton donated	20,000
Leaving the actual cost of the land to the National Asylum	30,400

Or $77 37 per acre.

The land is three miles west of Dayton, bounded on two sides by public macadamized roads, and overlooks the city and miles of the surrounding country. It has numerous springs of excellent water and inexhaustable quarries of valuable stone. Lands adjoining it are now worth from $150 to $250 per acre, and lands a half mile nearer the city are selling from $300 to $500 per acre.

The construction of the buildings and the improvement of the grounds devolved upon me as the local manager, and to show the difficulties encountered and the work actually accomplished, I beg to repeat what I said in the opening of the new hospital, May 19, 1870, as reported in the Cincinnati Gazette:

"A little over two years ago the managers of the National Asylum purchased these grounds and authorized me to commence work. Winter was approaching, and hundreds of disabled soldiers—homeless, penniless, and almost friendless— were seeking admission. We could not wait for plans, nor for an architect. In one week we put up out of Camp Chase lumber, donated by Congress, the first of the one-story barracks, and filled it on the very day it was completed. The next week we put up another, and it was immediately filled. And so we went, in summer and winter, adding building to building, and filling each as soon as it was completed. First we used an old barn for a dining-room; becoming too small, we added a wing, then another, then still another; finally took up and threw out the old barn, raised the whole another story, and left the dining-hall as it now stands.

"The first winter we cared for four hundred men, the second nine hundred, and last winter our rolls showed thirteen hundred, and to-day we celebrate the completion of another building, adding to our capacity three hundred more beds, every one of which will be filled during the coming winter.

"Looking at these buildings and grounds to-day, we are painfully sensible of the fact that there is much that would not stand criticism. Many of you could have done it better; we think it very likely. We can only plead that under many embarrassments and difficulties we did the best we could. Had we thought only of buildings and grounds, only of architectural and landscape effect, we could, perhaps, have done better ourselves. But our constant aim was to help and care for the sick and disabled soldiers, and to provide for them, with the least possible delay, a home—a pleasant, comfortable, and happy home; and if we have succeeded in that, our dearest wishes have been realized and our highest ambition gratified."

The Central Asylum has now upon its grounds sixty buildings. I append hereto a list prepared by Mr. C. B. Davis, architect and superintendent of the work, showing

the material, number of stories, dimensions and capacity in the way of floors and air space of the more important of these buildings. It will be seen that these buildings alone contain 243,341 square feet of floors, equivalent to $5\frac{5}{8}$ acres of floors; and that the air space of the same is 3,079,361 cubic feet.

Cubic measurement, showing air space in the several buildings of the Central National Asylum for Disabled Volunteer Soldiers, Dayton, Ohio.

Description of buildings.	Material.	Number of stories.	Length.	Width.	Height.	Number of superficial feet in floor.	Capacity.

Included in these buildings, and so proper credits to the construction account, are the engines, two boilers, and heating apparatus of the hospital; the engine, boiler, and machinery of the steam laundry; the engine, boiler, sawing and turning machines of the work shops; the gasworks, in which gas is manufactured from coal in quantities sufficient to light every building of the asylum; the steam-pumps and hydraulic rams which throw water from the lakes into the buildings; the two large iron tanks which form the reservoir for the water supply; the furnaces by which church, library, and offices are heated; all the baths, closets, gas fixtures, &c., and considerable part of the heavier furniture of the church, music hall, library, amusement hall, and other buildings of the institution.

But besides the construction of these buildings, much work has been done upon the grounds. I give some particulars taken from actual measurement. Four lakes have been made, which together cover over six acres of ground, and contain near 20,000 barrels of pure water, supplied by never-failing springs, and affording an ample supply of water for all the purposes of the asylum. Three miles and a half of avenue, much of it 40 feet wide, all of it heavily coated with stone and gravel, have been made since the purchase of the land. Two and a half miles of iron pipe for conveying water and

gas into the several buildings, and one mile and a quarter of drain pipe for sewerage purposes have been laid, and a mile and a quarter of stone culverts for drainage have also been made. In grading the grounds for buildings and avenues, 40,000 cubic yards of earth have been moved, and in building walls for cisterns, wells, sewers, springs, wasteways, to over 2,500 perch of stone have been used. Over 2,000 trees, shrubs, and evergreens have been planted, and nearly three miles of picket and wire fence built.

TOTAL COST OF BUILDINGS, ETC.

In constructing the buildings, and improving and ornamenting the grounds as aforesaid, there have been expended up to December 1, 1870	$579,804 72
Deducting amount realized from sale of Camp Chase lumber, not worth removing	8,018 60
Leaves as total sum expended of asylum funds	571,786 12
Add amount paid by National Asylum for the land	30,400 00
Makes total cost of land, buildings, and improvements	602,186 12

ACCOUNT WITH TREASURER.

I have received from Major General B. F. Butler, acting treasurer of the National Asylum, for purchase of land and construction purposes, at Central Asylum, up to December 1, 1870, the sum of	$606,870 82
And have paid out as above, up to December 1, 1870, for which I have shown vouchers to your sub-committee, the sum of	602,186 12
Leaving in my hands for completion of work, ordered by the board, and now in progress, the sum of	4,684 70

Respectfully submitted.

LEWIS B. GUNCKEL.

DAYTON, OHIO, *December* 1, 1870.

To the honorable the Military Committee, House of Representatives:

GENTLEMEN: In accordance with instructions contained in letter of General James A. Negley, chairman investigating committee, dated October 26, 1870, I have the honor, in the inability of the surgeon from sickness, to transmit hospital reports called for by the aforesaid honorable committee.

In connection therewith, I beg leave to submit a few brief statements of the general history, effects, and management of the hospital. I am glad to congratulate Congress and the nation, through you, on the completion of this grand living memorial to the nation's heroic defenders. We revert to the time when, in the infancy of this asylum, the sick and wounded soldiers were transferred from Columbus, and hundreds of sick, homeless, and friendless soldiers were applying for admission; they were all sheltered in the rude buildings erected from the lumber donated by the United States Government. In these buildings they were exposed to the inclemency of the weather, and suffered from the want of accommodations so essential to the sick. When the present barracks were erected, the old buildings were retained as a hospital. They were rough frame buildings, raised about four feet from the ground, one story in height. In these, although everything possible under the circumstances was done to treat them properly, although their wants as regards medicine, attendance, and diet were satisfied, and they were cheered by the unceasing visits of kind, encouraging friends from all sections of the land, yet our accommodations were very limited, and many of the sick had to be treated in barracks. Thus there was universal joy when the day arrived for the dedication and opening of our present new and commodious building. The presence of thousands who participated in the exercises on that day, and the reception of cheering words of congratulation, encouragement, and sympathy that poured in from all parts of our land, testified to the poor wounded or sick soldier that the nation had not forgotten its humble defenders. It was a proud day for all. This is indeed a "haven of rest" to the wounded or disease-stricken man. Here they may receive that care and attention that may ultimately be the means of restoring them to health and usefulness. They have here every comfort possible to give them away from their homes, and it is a lamentable fact that a large portion of these disabled soldiers, if not cared for here, would be thrown upon the cold mercies of State, county, or township charities. They realize this fact; although they never regret the sacrifices they have

made, they fully appreciate their country's generosity to them, and are grateful. Some of these unfortunate men are so afflicted that they never can recover. They come here prostrated by disease or wounds contracted in the bitter exposures of the war; many, afflicted with consumption and other diseases, will linger out but a brief period on earth. They wander around these beautiful grounds, or gather in the various places of amusement or recreation prepared for them, and are as contented and happy as possible. From the special diet bill of fare, (copy submitted,) articles are ordered by the surgeon to suit particular cases. The average yearly cost of hospital ration for the year ending November 30, 1870, was 29⅛ cents.

I also submit a brief description of the hospital. The building is of brick, three stories high, 293 feet front. It is composed of a center and two wings; the former is the administrative building; the latter, wards for the sick. The three floors are duplicates of each other; the wards are each 31 by 116 feet, to each of which is added two lower rooms 12 feet square, which furnish ample room and commodious apartments for each ward; the front for bath-rooms, the rear for water-closets and urinals. The building is heated by steam, on the most modern and scientific principles. The insane ward is situated 200 feet in the rear, and to the left of the main building. This is also the epileptic ward; here these unfortunate men are attended by careful nurses, until they are removed to the United States Government Insane Asylum, Washington, D. C. The boiler-house and coal-shed are located 200 feet in the rear of the main building, connected by a tunnel 7 feet 3 inches by 7 feet 6 inches wide, in which are the steam and water-pipes and a small rail-way to supply kitchen and other fires with coal. Ultimately all the cooking will be done by steam, supplied direct from the boiler.

In this connection, I would state that the construction of the building was supervised by our worthy and efficient surgeon, Dr. Clark McDermont, who has been identified with the asylum from its infancy, and whose long experience in surgery and medicine, both in civil and military life, eminently qualifies him for the position he holds. In the construction of the hospital he gave the benefit of a wide experience in similar institutions throughout the country.

The whole building is commodious and beautiful, and is an enduring proof of the tender care of the republic for the disabled soldiers who risked their lives for her defense, in time of trouble.

I am, gentlemen, very respectfully, your obedient servant,

E. F. BROWN,
Deputy Governor.

CENTRAL NATIONAL ASYLUM FOR DISABLED VOLUNTEER SOLDIERS,
Dayton, Ohio, December 15, 1870.

The report of the third quarter for 1869 was made out for four months. Hence the column for that year includes thirteen months, while that for 1870 includes only three quarterly reports, or nine months. This accounts for the number of cases given as treated respectively in 1869 and 1870.

A. S. DUNLAP,
Assistant Surgeon.

National Asylum for Disabled Volunteer Soldiers—Northwestern Branch.

BILL OF FARE.

SUNDAY.

Breakfast.—Cold corned beef, meat and vegetable hash, brown bread, butter or sirup' coffee.
Dinner.—Baked pork and beans, potatoes, pickled beets, bread, pie, coffee.
Supper.—Bread, coffee, cake, butter, fruit, tea.

MONDAY.

Breakfast.—Fried pork and potatoes, cold beans, bread, butter or sirup, coffee.
Dinner.—Roast beef, potatoes, boiled onions, bread, coffee.
Supper.—Hominy or mush and sirup, bread, butter, tea.

TUESDAY.

Breakfast.—Beef stew, bread, butter or sirup, coffee.
Dinner.—Beef and vegetable soup, boiled pork, potatoes, bread, boiled cabbage.
Supper.—Bread, butter, cheese, tea.

WEDNESDAY.

Breakfast.—Meat and vegetable hash, cold boiled pork, (sliced,) bread, butter or sirup, coffee.
Dinner.—Mutton roast or pot pie, potatoes, bread, pickles, coffee.
Supper.—Rice and sirup, bread, butter, tea.

THURSDAY.

Breakfast.—Mutton stew with vegetables, bread, butter or sirup, coffee.
Dinner.—Boiled shoulder, potatoes, boiled cabbage, bread, coffee.
Supper.—Biscuit, bread, butter, fruit, tea.

FRIDAY.

Breakfast.—Fish balls or mackerel, shoulder, (sliced cold,) bread, butter or sirup, coffee.
Dinner.—Cod-fish, beef, (roast or boiled,) potatoes, bread pudding, coffee.
Supper.—Corn bread, bread, butter, tea.

SATURDAY.

Breakfast.—Beef stew, bread, butter or sirup, coffee.
Dinner.—Corned beef, (boiled with vegetables,) bread, coffee.
Supper.—Ginger-bread, bread, butter, fruit, tea.

This bill of fare shall be followed for full diet in this asylum until further orders.

S. K. TOWLE,
Acting Steward.

Approved.

JOHN WOOLLEY,
Deputy Governor.

DECEMBER 1, 1870.

CENTRAL ASYLUM FOR DISABLED VOLUNTEER SOLDIERS,
Dayton, Ohio, December 15, 1870.

GENTLEMEN: In compliance with your request of October 26, 1870, I have the honor to submit the following statement of the general management and workings of this branch of the National Asylum for Disabled Volunteer Soldiers, from its organization to the present time.

The honorable the board of managers of this asylum, after careful investigation and personal inspection, fixed upon this as a site in every way eligible for its present purposes. Many important things had to be considered in locating a "home" for more than a thousand disabled and debilitated men, and the great advantages, belongings, and surroundings of this beautiful spot attest, in the very strongest manner, to the zeal and ability of the managers in the discharge of this duty. They negotiated here for 400 acres of splendid land—four farms—on a ridge of hills, with beautiful woods, overlooking the city of Dayton and surrounding country, with the Miami Valley and Rive r skirting their base. The location is three and a half miles from the city of Dayton, on

an eminence, determined by actual geological survey to be 274 feet above low-water mark in the Miami River, at Dayton, and 561 feet above low-water mark in the Ohio River at Cincinnati, in the heart of a rich farming country, and in every way healthful and desirable. This purchase, as appears from the minutes of the board of managers, was approved and ratified at their meeting on the 7th day of September, 1867.

The organization of this, the Central Asylum, as an institution, dates from March 26, 1867, at which time Hon. L. B. Gunckel, resident manager, took formal charge of the disabled soldiers then at the Ohio State Home, and transferred them to the care of the National Asylum.

The grounds where this institution now stands were taken possession of early in August, 1867, and the first men were sheltered here September 2, 1867, but the final transfer of all the disabled soldiers from the Ohio State Home did not take place until the very last days of 1867; so that it is not quite three years since this branch was fully established.

It has always been the warm desire of the resident manager—and this desire permeates all his actions—to make this a "home," a real "home," for the brave men disabled in the nation's service, but it was his first care to provide a shelter as speedily as possible for these disabled men, and temporary buildings then standing at Camp Chase, Ohio, and donated to us by the Government, were transferred to this place and re-erected here, and such was the demand for shelter that each building was crowded before its completion. This state of affairs existed through the winter and spring of 1868; even temporary shelter could not be provided as fast as it was demanded, and the board of managers contracted for the maintenance of many disabled soldiers at some of the old State Homes until buildings sufficient for their accommodation could be erected here and at the other barracks.

Day by day this institution grew larger until it has assumed immense proportions; and large as it even now is, it is scarcely able to accommodate the number of men who rejoice in and are blessed by its benefits. This day it furnishes a comfortable, and, in some respects, a luxurious home to 1,130 disabled soldiers, furnishing them with amusements, entertainments, literature, education, moral and religious instruction, light and suitable employment, good quarters, clean clothing and linen, and excellent food. In addition to these, we have 350 men on furlough, making our total number 1,480.

To the casual observer, the person who saw this place in 1868 and did not again behold it until 1870, the rapid growth of the buildings and the vast improvement and ornamentation of the grounds seems a grandeur of design and a miracle of execution; indeed, to the constant observer of this work it seemed to progress with unexampled rapidity. To the efficient local manager, Hon. L. B. Gunckel, and to his zeal and energy in the cause, is attributable this wonderful advancement.

We were at first compelled to put the sick in the old wooden barracks from Camp Chase, but to-day a magnificent and well-appointed brick hospital affords fitting accommodation to 300 sick and disabled soldiers.

At first we worshiped God in any available place, but to-day a beautiful church points its steeple to the heavens, and affords us a sanctuary where we may kneel and thank the God who guided us to victory for the blessings and the comforts of this noble institution. America may well be proud of this asylum for her war-worn heroes, sheltering, as it does, more disabled soldiers than the oldest military institution in the oldest or greatest military nations in the world.

Economy and a desire to divert the minds of the men, as well as to profit the institution, suggested that many of the articles of furniture and much of the repairing needed in the institution be done upon the premises by inmates, and at little expense, and that some light trades suited to the disabled condition of the men be put in operation. Accordingly shops were organized from time to time, and to-day we have, in full working order, and run by inmates, shops in which the following trades are adroitly and profitably plied, viz: Plumbing, gasfitting, carpentering, cabinet-making, wagon-making, blacksmithing, shoemaking, harness-making, cigar-making, basket-making, broom-making, chair-bottoming, painting, printing, tinning, book-binding, and knitting by machinery.

As a natural result of the war, the men were demoralized and disorderly, and needed more or less restraint and severity. A guard-house was established, which was at first well patronized, and severe and peremptory measures were found necessary to the proper discipline of the institution.

But the humanizing influences of the spacious library, containing 3,264 volumes of the choicest literature, the moral and religious teachings administered, and the refining effect of the splendid grounds and surroundings, rapidly obliterated this moral miasma, so that our guard-house is little used, and discipline is now so easy that peremptory measures are seldom necessary to its enforcement.

Before proceeding further I am constrained by a sense of duty to pay a well-earned tribute to Mrs. Mary Lowell Putnam, of Massachusetts, who generously donated to us the "Putnam Library," numbering over 3,000 volumes, the very gems of literature. She also gave us some hundreds of precious pictures, mostly of foreign production, and these

ornament the room in which her literary gift is placed. She has made us presents to the value of several thousand dollars, and scarce a week passes without bringing us fresh proofs of her friendship, generosity, and devotion. Of all our many kind friends she stands the foremost, and there is not a veteran within our walls but feels for her the truest and warmest affection, and fervently blesses the noble, generous woman who evinces so strong an interest in his welfare and elevation.

Our artificial lakes cover a space of six acres, and our ornamental springs, rustic arbors, grottos, green-houses, and hot-houses elicit the admiration of all. We have a deer park, containing twenty-eight deer.

For the amusement of the men we employ billiards, bagatelle, pigeon-hole, ten-pins, foot-ball, and base ball, and each has its votaries, and is fraught with good results. We have also a beautiful music hall, and many entertainments are given us therein by our kind friends of Dayton and vicinity. Few persons are in a better position than we to attest to the loyalty of the American people. We are visited, favored and entertained by all classes of the people, and every one seems pleased at beholding here what the Government has done for its defenders.

Among their many praiseworthy qualities, there is one possessed by our men that wins my admiration, and that is their industry.

No matter how badly disabled they may be, some ingenious contrivance, generally originating in their own brains, is devised to so far overcome their disability as to make it possible for them to work; and disabled men, inmates of this asylum, perform the necessary work in the bakery and kitchens, on the farm, in the gardens, driving asylum teams, &c.; in fact, all the asylum work is done by inmates, except four citizen employés, and even these will be dispensed with so soon as inmates are found who are competent to take their places. We have a well-appointed bath-house, and the men fully appreciate it.

Our command, numbering 1,130 men, is divided into eleven companies, each under the charge of an orderly sergeant, and mustering about 100 men present. We have no corporals or sergeants, simply the orderly sergeant in charge, each of whom makes up a morning report every day, and delivers same to the post adjutant, who consolidates them. These sergeants draw and issue underclothing to their men every week, see that their beds are in order and their quarters kept clean, and do any and everything necessary to the proper police of their barrack. We have an inspection of the full command every Saturday, and an inspection and muster on the first Saturday in each month; and, such is the efficiency of the sergeants, that we seldom find anything to correct or regulate. The men are very cleanly in their every-day life, and they come on inspection looking neat and in good order.

We have a regular United States post-office here, and the postmaster and assistant postmaster are appointed from among the disabled soldiers. We have also an asylum store, in which is sold nearly everything which the men are likely to want. This store is managed by a disabled soldier, and the net profits of the same go to the literary and amusement fund of the institution, managed and controlled by the chaplain.

I have nothing more of interest to say, but I cannot close this report without referring to the general good conduct of our men. Here are over 1,100 men, representing a population of at least 8,000 persons, and yet almost as orderly and quiet as a private family. This is a feature of which I am peculiarly proud.

I have the honor to be, gentlemen, very respectfully, your obedient servant,

E. F. BROWN,
Deputy Governor.

THE HON. COMMITTEE ON MILITARY AFFAIRS,
House of Representatives.

APPENDIX H.

MILWAUKEE, *December* 14, 1870.

GENERAL: In reply to your letter asking information as to cost of grounds and improvements made thereon at the Northwestern Branch National Asylum, I have the honor to report as follows:

Cost of 410 acres	$77,000 00
Cost of buildings and improvements to November 30, 1869, when my duties therewith ceased	347,050 85
Expended since on same account, as appears from records of the asylum	12,832 90
Total	436,883 75

Very respectfully, your obedient servant,

E. B. WOLCOTT,
Resident Manager.

General JAMES S. NEGLEY,
Chairman Committee House of Representatives on Investigation of National Asylum, &c

APPENDIX H.

MILWAUKEE, WISCONSIN, *January* 3, 1871.

GENERAL: I have the honor to transmit herewith my report called for in your letter of October 26, ultimo. I regret that I cannot give you such a report as you desire, and as I would like; but wanting the records from which to compile it, I am prevented from so doing. I have given you all that I can find here, but from such information as I have I am of the opinion that you can get from the reports in possession of General Butler, president and treasurer, all the information you call for. So far as the general management of this branch is concerned, I have only partial information, and that to the effect that it has always been well governed, and that the law, by-laws, and regulations have uniformly been complied with. The inmates have been well provided with quarters, clothing, and rations in abundance and of first-rate quality: in fact, better supplied than a large portion of the community outside the asylum. The mental wants of the inmates have been well supplied in the way of a good library, which now numbers 1,500 volumes, and also with daily, weekly, and tri-weekly newspapers, together with a liberal number of the most popular magazines and pictorial sheets. Every effort has been made to improve the moral condition of the men. Religious exercises are held three or four times per week by both Protestant and Catholic denominations, and in some measure with good results. Corporal punishment is never resorted to, moral suasion being the rule, and when that will not do, expulsion or some slight fine or light labor is imposed. We have a temperance organization of Good Templars numbering about 100 members, also a Catholic society having some 60 members, whose object is to better the general condition of the men. Both of these are doing good work, and are heartily countenanced by the officers. Bagatelle tables, chess, backgammon, dominoes, cards, and ten-pins afford partial amusements. Concerts and theatrical entertainments are given by the inmates, and occasionally by our friends from Milwaukee, who generously come to us, and by their performances help to break the monotony of asylum life. Instruction in music is a feature, and we now have a band which, considering the short time they have been playing, render a very fair performance. Vocal music has its votaries, also, and our church and society singing is quite as good as that generally found in any community. In skilled labor we are very deficient, and our workshops are used only for repairing, and keep quite a number constantly employed. In the warm weather a large number find employment in cultivating the farm, fields, and garden, and keeping the avenues and grounds in order. Our farm the past year has proved quite profitable, as evidenced that we have not to buy grain or vegetables of any kind save potatoes. Our hospital department is very complete and comfortable, and every attention is given to the afflicted. Regular and special nurses are employed, and in the matter of diet just care is taken in furnishing the most wholesome quality, and in variety to suit all tastes. Taking the asylum as a whole, buildings, outfit, and grounds, I think it quite the equal of any public institution in this country, and certainly no country furnishes so good a home for its maimed and crippled soldiers, or one where their every want is more generously supplied.

I am, general, very respectfully, your obedient servant,

JOHN WOOLLEY,
Deputy Governor.

General JAMES S. NEGLEY,
Chairman Congressional Committee.

APPENDIX I.

NATIONAL ASYLUM, EASTERN BRANCH,
Augusta, Me., November 30, 1870.

SIR: In accordance with your request, I beg leave to offer the following report upon the condition of the Eastern branch of the National Military Asylum.

As you already know, this branch was opened early in the year 1867 at Togus Springs, a watering-place five miles east of the city of Augusta.

A large hotel, (with outbuildings, stable, and barns,) capable of accommodating 300 guests, stood upon the spot. Its adaptability to the purpose required, and its readiness for almost immediate occupancy, induced the board of managers to secure it as soon as its advantages became known. The former owner had spent large sums of money in building the hotel and clearing the grounds; but his enterprise failed, as the attractions were insufficient to bring together a large number of fashionable people. The board of managers were therefore enabled to purchase the property upon very favorable terms. The buildings were immediately fitted up for the use of the soldiers, and their number constantly increased during the year 1867.

In January, 1868, there were 221 soldiers connected with the institution; but in the

latter month a misfortune occurred in the burning and total destruction of the principal building of the establishment.

The most of the beneficiaries were removed to other homes, and measures taken to rebuild. A brick hospital, which had previously been erected near the main building, was saved from the fire in a damaged condition.

In 1868 and 1869 three more brick buildings were erected, and the fourth one repaired. These were made nearly fire-proof, were heated by steam, and the most modern apparatus supplied for gas, kitchen, laundry, &c. Their arrangement for the health, convenience, and comfort of the men is all that could be desired; and it may be truly said that these buildings, as well as those subsequently erected for other purposes, show a remarkably economic management in their construction.

The amount of money expended for the purchase of grounds and for permanent improvements has been as follows, viz:

Hotel, furniture, out-buildings, and 1,100 acres of land		$50,000
Wood lot, 400 acres, bought in 1869, 10,000 cords standing wood		6,500
		56,500
Craig lot, so called, for reservoir, 160 acres		1,300
		57,800
Fittings to hotel buildings, apparatus for steam-cooking, plumbing, &c., and repairs to other buildings		26,000
Cost of four principal brick buildings, with gas, cooking, heating, and washing apparatus		100,000
Brick barn		5,000
Wooden barns and other out-buildings repaired		5,000
Amusement hall, (brick)		17,000
Governor's house, (brick)		10,000
Storehouse, (wood)		1,000
Carpenter's shop, (wood)		500
Reservoir for water supply, 2,477,700 gallons capacity		16,000
Workshop, (brick)		5,000
		243,300
Deduct losses by fire on main building	$40,000	
On fixtures and furniture	30,000	
On damage to new buildings	5,000	
		75,000
Leaving the total cost of present buildings and grounds		168,300

A description of the buildings is appended.

The cost of maintaining the asylum for the year ending November 30, 1870, is as follows:

Abstract "A," subsistence	$42,263	73
Abstract "C," farm	7,683	79
Abstract "D," property	8,757	77
Abstract "E," current expenses	43,269	45
Abstract "F," incidental	2,319	55
Abstract "G," transportation	9,987	93
Abstract "I," hospital	496	12
Abstract "J," clothing	783	92
	115,562	26
Less received for clothing and transportation from men, and subsistence, charged construction, being cost of supplies to mechanics	16,661	37
	98,900	89

It is due to the farm to say that it has supplied the subsistence account with food, valued at $5,714 86.

A statement of the number of inmates of the asylum on the first day of every month since the opening of the asylum is appended.

The farm is, as yet, in its infancy, the work of construction having engaged the services of all the available men and teams most of the time. There are 150 acres of arable land. The past season there were cultivated some 50 acres; the other 100 acres are in upland grass. There are also some 100 acres of meadow land, which have hitherto been overflowed in winter time, but means have been taken the past season to insure its drainage. It lies in a sort of dish shape, surrounded by hills, the build-

ings being placed upon rising ground or knolls in its center. The rim of this dish has been cut through to permit the rapid outlet of the water which flows from the high lands. The value of the farm has been very much increased thereby, as it is expected in future to produce upon this meadow two or three tons of upland or English grass hay, instead of one ton of wire or swale grass hay per acre.

The products of the farm and their value have been as follows for past year:

100 tons English hay, say $20	$2,000 00
100 tons swale hay, say $10	1,000 00
1,620 bushels potatoes	900 00
282 bushels turnips	166 25
107 bushels beans	286 50
200 bushels oats	100 00
3,763 gallons milk	962 10
Small items	300 00
Increase of stock by growth	1,500 00
Beef killed	3,300 00
	10,514 75
Less hay used by farm animals	1,500 00
	9,014 75

With a liberal outlay in a stock of good animals and implements, and an abundance of labor, there is no reason why the farm may not become very profitable, for we possess an immense advantage in our facilities for making manure, which is the foundation of all farming in the Eastern States.

The land is well adapted to stock-raising, and the hope is indulged that in a few years it may be made to produce quite a large proportion of the beef consumed by the soldiers.

One year ago there was much mental unhealthiness exhibited by the men, both of the active and passive kinds, and it soon appeared that not only amusement but work was necessary to their happiness and proper discipline.

During the winter, lectures and debates were had, and some concerts and theatrical entertainments given, in which the inmates performed the parts. As soon as spring opened, all who were able to do anything at all were set at work on the farm, the reservoir, and on the construction of buildings. Of course citizen mechanics were employed to do the skilled labor, but the men have done a vast amount of simple labor for the Government on an average pay of $15 a month. Many men of sedentary habits, old men, and those who have lost a leg, found nothing to do until the establishment of the shoe factory, which was started in June with a proper set of tools and machinery. Four experts were engaged to prepare the work and teach the men. After the drawbacks always to be encountered in such an enterprise, the business may now be said to be well established, with flattering prospects of success in a pecuniary point of view. As for moral success, it is an accomplished fact. Already there are forty men employed who would be otherwise leading idle, objectless lives, ready subjects for the tempter in whatever guise he might appear. We have made, up to the date of this report, (November 30, 1870,) 14,940 pair of shoes, for which we have paid to inmates as their share for labor $2,008 85. We do not assume that these men are always to remain in an institution of this kind, but expect many of them, as they regain health and spirit, to again go out into the world and take their share in the duties of society and citizenship. And with what stronger hope or assurance can they undertake once more to assume such duties, than is inspired by the possession of a good trade?

Any worthy soldier who has received an honorable discharge from the Army, if suffering under such a degree of disability that the privileges and comforts of such a home as this would be convenient to him, may enter the asylum, upon assigning thereto his pension for the time during which he may remain therein, and giving an obligation to be governed by the rules and articles of war, and such other regulations as may be prescribed by the board of managers, or the officers of the asylum. If he has dependents, his pension money is sent to them. If he has no relatives, his money is given to him in such sums as is deemed for his interest, the cost of his clothing being first deducted. The money earned by labor in the Institution is paid over in the same manner.

It may here be remarked that a shop has been opened to save the necessity of too frequent visits to the city, which never result in much good. The soldiers can receive checks or money tokens which are good in the asylum store any day; but money proper, only once a fortnight. The profits of the store go to the amusement fund, which is expended for the pleasure of the men. The largest items of expenditure from this fund

have been for billiard tables and stage scenery. All fines go to the credit of the same fund, so that the bad soldier is made to pay for the amusement of his comrades.

Any soldier may have a discharge or furlough, upon giving reasonable evidence of being able to pay his traveling expenses and support himself.

It has been found necessary to make stringent conditions of readmission, however, as the restless disposition of the men, and the undue confidence that they acquire in themselves, after a season of freedom from temptation, lead them often to desire a discharge when it is to their interest to remain in the asylum.

I certify upon honor that the foregoing statement is true, all the facts and figures being taken from the books and records in the office of this branch.

WM. S. TILTON,
Deputy Governor.

146 inmates transferred to Philadelphia and Dayton. Asylum burned. No accommodations.

I certify that the foregoing table is correct.

P. T. WOODFIN,
Secretary.

Surgeon's report.

General WILLIAM S. TILTON:

In accordance with your instructions I submit a statement showing the workings of the hospital for the past year.

The largest number present at any one time was 51, in the month of January. In the month of May the number was reduced to 15 and in September to 14, the smallest number present at one time. Several have been admitted in such a low condition that they survived but a few weeks or days in some cases. No one the past year has died of any disease contracted here.

Of the whole number treated for the past twelve months, (114,) 72 have been cured and discharged, 19 deaths have taken place, several have been transferred, and 18 are now under treatment.

The object of the surgeon has been to coöperate with the general in having every man perform some useful labor as far as he was able. The use of alcoholic stimulants has been curtailed as far as possible, the use for most part being in the composition of tonic bitters, &c.

As to the character of the diseases, those of a chronic character are the prevailing ones.

There have been twenty-seven distinct diseases treated, as follows:

Consumption, 33 cases; chronic rheumatism, 10; gun-shot wounds, 8; diseases of the eye, 8; general debility, 6; necrosis, 5; intermittent fever, 4; paralysis, 4; chronic bronchitis, 4; locomotor ataxia, 3; insane, 1; heart disease, 3; chronic ulcers, 3; hemiphlegia, 2; paraplegia, 2; chronic diarrhea 2; syphilis, 2; gonorrhea, 2; asthma, 2; hernia, 2; dropsy, 2; dyspepia, 1; stricture of rectum, 1; eczema, 1; cancer, 1; pleurisy, 1; Bright's disease, 1; total, 114 cases.

The ratio of numbers in hospital, and of deaths to the whole number present in the institution for each month, has been as follows:

	In hospital.		*Deaths.*	
December, one in	9.01	one in	260.50
January, one in	8.79	one in	431.00
February, one in	9.86	one in	141.03
March, one in	12.30	one in	369.00
April, one in	14.76	one in	109.00
May, one in	20.00	one in	170.00
June, one in	18.33	one in	303.50
July, one in	19.33	one in	207.50
August, one in	22.00	one in	412.00
September, one in	24.23	one in	135.33
October, one in	27.06		
November, one in	19.83		

These figures include the whole number treated during the month, which is, of course, larger than the number present in hospital at any one time.

Respectfully submitted.

I. H. STEARNS,
Surgeon.

41ST CONGRESS, 3d Session. | HOUSE OF REPRESENTATIVES. | REPORT No. 46.

BRADY'S COLLECTION OF HISTORICAL PORTRAITS.

MARCH 3, 1871.—Ordered to be printed and recommitted to the Joint Committee on the Library.

Mr. PETERS, from the Joint Committee on the Library, made the following

REPORT.

The Joint Committee on the Library, to whom was referred the memorial of M. B. Brady, of New York, photographer, proposing to the Congress of the United States the purchase of his National Collection of the portraits of eminent Americans, embracing those of our most illustrious statesmen, legislators, jurists, journalists, inventors, authors, artists, explorers, soldiers, sailors, and representative men of various classes, having duly considered the same, submit the following report:

The work of forming and completing the large and varied Collection of Portraits embraced in the catalogue of Mr. Brady's gallery, has been the occupation, in a prime measure, of thirty years of his business life, during which period, as is well known, his superiority as a photographic artist has earned for him national recognition and distinction. His collection presents, in the highest perfection to which the photographic art has attained, an historical gallery in which the most illustrious men in our history are embraced, and is therefore a property unique in its character and interest, and of a value not to be estimated solely by a pecuniary standard. It is, as it were, a Photographic Pantheon, in which the votive genius of American art has perpetuated, with the unerring fidelity with which the lens of the camera does its inimitable work, not only the likeness of form and feature, but the very countenances, with their living and natural expression, of those in whose achievements in all walks of life the American heart takes pride, and whose memory we endeavor to glorify by whatever means it is in our power to exert.

There are many considerations which are of controlling influence in the conclusion to which your committee have arrived, that such a collection as the one in question—one so comprehensive and national in its character, and so impressive with patriotic and personal associations, in the fact that all its portraits have been taken from actual life—should not be permitted to remain subject to the vicissitudes of mere personal ownership, but, for the sake of its preservation and permanent safety, should become the property of the Government.

As the mere illustrator and exponent of the photographic art, now so universal in its adaptation to the highest human tastes, and so conducive to human welfare and happiness, in the possession of our Government this Collection of Historical Portraits would become a monument to the inventive genius of our own country, through which photography has reached its present degree of perfection. As a memorial

of the illustrious dead, whose names are connected with the great events of American history, there can be no more worthy act performed by the Congress of the United States than to secure for it a fixed place of deposit in the Library of Congress; while the collection, placed there in an accessible and suitable form for general inspection and study—an historical album both of the living and of the dead—would be a constant source of national gratification, and its locality the very shrine of patriotism. "A portrait," according to an eminent authority, "is superior in real instruction to half a dozen written biographies;" nor can we doubt that the purchase by the Government of this Collection, and its exhibition in the Library, will fail to exert the most salutary influence, kindling the patriotism as well as the artistic taste of the people. Through its means the country will become possessed of a rare collection of the portraits of her most distinguished sons. A collection around which not alone the idle and the curious will linger, but to which the artist will resort for the faithful representations of men, many of whom the eye may no longer behold, and where the historian may enrich his page with glimpses of life-like reality.

The gallery, in the form in which it is proposed by Mr. Brady to convey it to the Government, contains an aggregate of two thousand portraits, or thereabouts, and the same are to be uniformly mounted, classified, and bound, under the direction of the Joint Committee on the Library, or otherwise, as Congress shall direct. With reference to the price to be paid to Mr. Brady, and for which provision is made in the bill to be submitted, your committee have to say that the sum named is one which has been determined upon between your committee and the memorialist; and while falling short of the expectation of the latter as to the sum which, in view of the value of the property, might reasonably be demanded, is one, nevertheless, which, having been proffered by your committee, he has finally concluded to accept.

41ST CONGRESS, 3d Session. } HOUSE OF REPRESENTATIVES. { REPORT No. 47.

WILLIAM H. POWELL.

MARCH 3, 1871.—Ordered to be printed and recommitted to the Committee on the Library.

Mr. PETERS, from the Joint Committee on the Library, made the following

REPORT.

The Joint Committee on the Library, to whom was referred a joint resolution of inquiry relative to the contract with William H. Powell, for painting a picture for the National Capitol, illustrative of some naval victory, said contract being authorized by joint resolution of Congress approved March 2, 1865, *have considered the same and report:*

That four annual payments of $4,000 each have been made under the terms of the contract for said painting, besides the advance payment of $2,000 required by the joint resolution; that the committee have several times suspended the payment of the annual installments provided for in the resolution, under the terms of the proviso inserted in the contract by the committee, which proviso stipulates that "the committee may withhold the payment of any one or more of the annual installments of $4,000 whenever, in their judgment, the work is not satisfactorily progressing;" that the two last payments to Mr. Powell on account of the picture were ordered by the committee only upon certificates of the progress of the work, which furnished evidence deemed authentic by the committee that the picture was nearly completed; that the latest evidence thus furnished, under date of February 21, 1870, set forth that—

> The painting is complete in its drawing and in the proper position of all the vessels engaged. The colors are well laid in, and require only the retouching of light and shade to finish it. In our judgment the painting may be finished by the 1st of July proximo. We are therefore of the unanimous opinion that the last annual installment of the payment of three-fourths of the whole amount appropriated by Congress should be paid forthwith.
>
> JOHN A. DIX.
> E. W. STOUGHTON.
> FRANCIS VINTON.
> WM. H. ASPINWALL.
> A. A. LOW.

And that the committee, having reserved the sum of $7,000 in the contract, as not to be paid until the delivery of the painting, also required that "the picture shall be executed with reasonable dispatch, and be delivered to the committee within five years of the date" of the contract, which term of five years expired on the 2d of February, 1871.

○

41ST CONGRESS, 3d Session. } HOUSE OF REPRESENTATIVES. { REPORT No. 48.

VENTILATION OF SENATE CHAMBER AND HALL OF HOUSE OF REPRESENTATIVES.

MARCH 3, 1871.—Ordered to be printed and recommitted.

Mr. JENCKES, from the Joint Committee on Ventilation, made the following

REPORT.

The Committee on Lighting, Heating, and Ventilating the halls of the Capitol, to whom was referred the petition of F. C. Clark, agent, for the substitution of Wilson's electrical lighter for the one now in use over the Hall of the House of Representatives and in the dome and rotunda of the Capitol, submit the following report:

The committee gave notice of the pendency of said petition to Samuel Gardiner, the present electrician of the Capitol, and heard the parties at length upon the comparative merits of the apparatus. The committee have also examined the Gardiner apparatus, now in use in the Capitol, and have visited Corcoran's Art Gallery in this city and witnessed the operation of the Wilson lighter. Each apparatus is operated by electricity, but upon a different principle, and by substantially different means.

The Gardiner apparatus requires the use of the galvanic electricity, generated in such quantity as to heat a platinum wire over the lip of the burner to redness, and thus ignite the gas when it begins to flow. The battery required for this purpose is very large and powerful, and occupies one entire room in the central building of the Capitol. The Wilson lighter operates by an electric spark passed through the gas at the moment it is turned on. For this purpose a small battery only is required, with a coil and a connection, by means of a wire, with the burner, where the circuit is broken, and the spark made to pass between the disconnected points of the wire, whenever the electricity is permitted to act. The cost and the advantages and disadvantages of each are fully set forth in the papers hereto annexed.

As this business of lighting the Capitol is in charge of the Superintendent of Public Buildings and Grounds, the committee addressed a series of questions to him, framed so as to obtain information upon some questions of fact in dispute, and also to obtain his opinion upon the relative merits of the apparatus. A similar communication was addressed to the Architect of the Capitol. The questions and the answers of the two officers to whom they were addressed are hereto annexed.

The committee have looked at this proposition for a change in the mode of lighting the gas in the Capitol as a question of economy, under certain conditions. These conditions are that each apparatus should be certain and reliable in its operation, and not liable to accidents arising from its construction and mode of operation; and that there should be no liability for the use of any patented invention. It should require no

greater amount of skill to operate one than the other, or to keep the parts of the apparatus in repair and in working order.

Supposing those conditions to be equal, the Wilson apparatus is so much simpler in its construction and operation than the other, that the expense required to keep it in constant use appears to be but little more than the salary of the electrician. The saving in the use of the Wilson apparatus over the expense of keeping up and operating the Gardiner apparatus would pay for the cost of the change in four or five years at the furthest, even if nothing were realized from the sale of the apparatus now in use. On the question of economy the advantage is greatly in favor of the Wilson lighter.

The architect, however, does not seem to think that the Wilson apparatus has been in use for a sufficient length of time, or under circumstances testing its qualities and capacities, to justify its being placed in the dome of the Capitol, where any slight accident or failure to operate might be attended with dangerous consequences. As it has been already ordered to be applied to the lighting of the gas in the Senate chamber, it may be well to wait until its operation is there tested, before introducing it into the other parts of the building. If it be found equally reliable and certain as the Gardiner apparatus, and no more liable to derangement or accident, the committee are of opinion that the change ought to be made as a matter of economy. But they recommend that the subject be referred to the Superintendent of Public Buildings and Grounds, and the Architect of the Capitol, and that action be deferred until the results of the experiments they may make or require shall be known; and that, if any appropriation is made, it shall be expended or not according to their decision.

The committee append to this report the report made in the Fortieth Congress by the Committee of Accounts on the lighting of the gas by electricity.

HOUSE OF REPRESENTATIVES,
Washington, D. C., February 25, 1871.

DEAR SIR: The Committee on Ventilation, &c., request answers from you to the following questions:

1. What has been the approximate cost of apparatus for lighting the gas in the dome of the Capitol and the hall of the House of Representatives?
2. What has been the cost of operating the apparatus since its introduction?
3. What are the elements of loss or waste in its use, if any, and what proportion do they bear to the whole expense?
4. Are you acquainted with what is known as the Wilson apparatus for lighting gas-burners?
5. How does the first cost of the same compare with the cost of the Gardiner apparatus?
6. How does the cost of operating the Wilson apparatus compare with that of Gardiner's?
7. What is the comparative expense of repairs upon the two?
8. Suppose the expense of a new apparatus, according to the Wilson method, should cost not exceeding $15,000 for the rotunda and the hall of the House, and the expense of its operation should be reduced to the salary of a single electrician and almost a nominal expense for chemicals and battery, would it, in your opinion, be advisable to substitute such an apparatus for that now in use?

Please answer as soon as convenient.

Respectfully, yours,

T. A. JENCKES,
Chairman of Committee on Ventilation, &c., on part of the House.

General N. MICHLER,
Superintendent of Public Buildings, &c.

OFFICE OF PUBLIC BUILDINGS, GROUNDS, AND WORKS,
Washington, March 1, 1871.

SIR: I have the honor to acknowledge your letter of the 25th ultimo, respecting the apparatus for lighting the gas in the dome of the Capitol and halls of the House of Representatives, and requesting certain information in connection therewith. Presuming that you have retained a copy of the letter, I propose to answer your questions in the order in which they are asked, viz:

1. Original cost of apparatus for lighting the dome of the Capitol and hall of House of Representatives has been $35,718 37.

2. Cost of operating the apparatus since its introduction, $15,240 56.

3. Of the foregoing amount of $15,240 56 for operating, $9,976 76 was for salaries and $5,263 80 for chemicals and materials.

4. I am not well acquainted with the Wilson apparatus for lighting burners, but have seen the gas jets lighted in the halls of the Corcoran Art Building by this apparatus, and, in my opinion, it worked remarkably well.

5. The first cost of the Gardiner apparatus is given in the first answer at $35,718 37, and I have never seen an estimate for placing the Wilson apparatus in the localities referred to.

6. I am not acquainted with the cost of operating the Wilson apparatus, excepting so far as the agent informs me. It will be seen by the second answer that the cost of operating the Gardiner apparatus, which has been up about five years, averages about $3,048 11 per year for material and operating.

7. There are no data in my possession to enable me to answer this question. The repairs, if any, have been made by the Architect of the Capitol.

8. It will be seen by the figures already given in regard to the Gardiner apparatus, that, for the five years it has been in operation, the sum total, including the original cost of apparatus, maintenance, and labor, is $50,958 93. Presuming the cost of the Wilson apparatus not to exceed $15,000, as stated in this question, and for operating and material not to exceed what the agent states, the cost for the same length of time will be $21,250. There is, therefore, a difference of $29,708 93 in favor of the Wilson apparatus. In regard to substituting the Wilson for the Gardiner apparatus, I think before making the change it would be advisable to appoint a commission with a view of testing the relative merits of each.

It may be proper to state that the information relative to the cost of the Gardiner apparatus has been furnished by the First Comptroller of the Treasury up to March 1, 1867, and since the latter date to February 28, 1871, it has been taken from the books of this office.

Very respectfully,

N. MICHLER,
Major of Engineers U. S. A.

Hon. T. A. JENCKES,
Chairman of Committee on Ventilation
on the part of the House of Representatives.

ARCHITECT'S OFFICE, UNITED STATES CAPITOL EXTENSION,
Washington, D. C., February 27, 1871.

SIR: In reply to yours of the 25th instant, requesting a statement as to the cost of Gardiner's electric lighting apparatus, now in the dome and hall of Representatives, I have the honor to state that the apparatus for the dome cost about $26,000; that for the hall of Representatives, including the recent extension of the same, $11,000. In the foregoing amounts the sum of $2,000 is included for gas-pipe and services of gas-fitters.

I am not able to state the cost of operating this apparatus, or the element of loss, as these expenditures are under the control of General N. Michler, whom I have written, requesting the information desired.

I have some knowledge of the Wilson apparatus, but have not had any experience in its working. While I believe it is less costly to put in and to operate than the one now in use, yet I do not believe it would be wise to make any change, particularly in the dome, where there is no ventilation. The Gardiner apparatus has proved successful after years of trial. Owing to the platinum coils being red-hot for some time, there is a certainty of all the jets being ignited; while the other being lighted by a spark, if there should be many burners not lighted, there would be danger (in the dome) of the explosive mixture being formed, and serious consequences might ensue.

Very respectfully, your obedient servant,

EDWARD CLARK,
Architect.

Hon. THOMAS A. JENCKES,
Chairman Committee on Ventilation
on part of House of Representatives.

Memorial of F. C. Clark, agent, praying the substitution of Wilson's electrical lighter for the one now in use over the hall of Representatives and in the rotunda and dome of the Capitol.

To the honorable House of Representatives of the United States:

Your memorialist, fully believing that he is in possession of the most practical, durable, economical, and only instantaneous method in use for lighting gas by electricity, viz, Wilson's electric gas-lighter, the only plan in which the *electric spark* is applied to such a purpose, and in view of the fact that during the previous session of this Congress said Wilson's lighter was adopted for lighting the burners over the Senate Chamber, after a thorough comparison of its merits with those of the apparatus now employed over the hall of Representatives and in the dome and rotunda, viz, Gardiner's apparatus, your memorialist, therefore, as agent for said invention, being desirous of at once introducing the same in lieu of the Gardiner lighter, would respectfully ask your attention to a concise description of the two methods, and the comparative relation they bear to the following principles involved, viz, economy, durability, rapidity, and safety.

ECONOMY.—The Gardiner method consists of a Smee battery of one hundred and sixty cells, containing each six gallons of diluted acid, and two plates of amalgamated zinc, each 9 by 10 inches, and a plate of platinized carbon of the same dimensions. The igniting of the gas is done by applying the current of electricity generated by this immense battery to a coil of fine platinum wire, which is heated to a white heat. In no case are there more than thirty burners lighted at one time. This battery is in constant consumption during the sessions of Congress. The following tabular statement, compiled from the records on file in the Treasury Department, exhibits the annual cost for maintenance of the Gardiner apparatus for the fiscal years ending June 30, 1867, 1868, and 1869. There is also considered in the statement the number of times the hall of Representatives and dome were lighted, the number of burners to which the apparatus was applied, and average cost for lighting each:

	No. of burners.	No. of times lighted.	Annual cost.
Fiscal year ending June 30, 1867	1,075	33	$2,652 72
Fiscal year ending June 30, 1868	1,243	24	3,321 99
Fiscal year ending June 30, 1869	2,193	47	3,959 80

Average cost per night in 1867		$80 38
Average cost per night in 1868		138 41
Average cost per night in 1869		84 25
Average cost for each burner, each time lighted, in 1867		07.5
Average cost for each burner, each time lighted, in 1868		11.1
Average cost for each burner, each time lighted, in 1869		03.8
Total cost for three years	9,934 51	
Average cost for one year	3,311 50	
Average cost for lighting each burner, each time lighted, during three years.		05.9

In addition to the cost of the maintenance of this apparatus for the three years above specified, there is justly chargeable the cost of forty cells of battery, which were consumed within that time. The number of cells originally purchased by the Government, in 1866, was two hundred. There are now but one hundred and sixty. Their cost was $46 06 per cell; total cost for forty cells consumed, $1,842 40. Adding this amount to the $9,934 51 stated above, the total cost for the three years is $11,776 91
Average cost for one year 3,925 64
Average cost for lighting each burner 07

The Wilson method employs a battery of but twelve Smee cells, of much less dimensions than Gardiner's, in connection with the induction coil. The battery is so arranged as to be in consumption only for the few moments actually employed in lighting; the plates, by mechanical device, being immediately removed thereafter from the acid, thereby rendering the annual cost for maintenance merely nominal.

DURABILITY.—The items of expense for maintenance of Gardiner's apparatus disclose great lack of durability, requiring the services of an electrician and assistant, both experts, to operate and keep it in repair, whose pay amount jointly to $2,295 per annum.

The platinum coils, in order to perform their office, are located in the hottest portion of the flame, and also where the utmost chemical action takes place, consequent upon the peculiar heat-generating property belonging to that metal; thus decomposition rapidly ensues, requiring their frequent renewal to an extent not less than 10 per cent. during and after each session of Congress, and, being of about the same value as gold, entails a large item of expense. The coils are also liable to be destroyed by an overcharged battery, and from the want of uniformity in the length, thickness, and quality of the wire to be heated.

The Gardiner apparatus is not and cannot be a reliable lighter, for the reason that it depends upon a *continuous circuit*. The destruction of any one of these platinum coils comprising parts of the circuit renders it impossible to ignite any one of the burners; and almost invariably this defect is not discovered until it fails to perform its office. Then, too, the nicety of their adjustment renders them constantly unreliable, both from contraction and expansion, and from the dusting and cleaning always necessary.

Wilson's lighter, on the contrary, depends upon *breaks in the circuit*, the electric spark leaping from metallic points into the burner. Hence the extreme care which is required in the Gardiner method, to preserve an unbroken circuit, is avoided; the least possible break under that method rendering his battery powerless.

RAPIDITY.—The Gardiner lighter is a *slow* method of lighting, not only on account of the limited number of burners which can be ignited at one time, but also from the fact that it requires a full and uniform flow of gas; for while the air contained in the pipes is being expelled, the wires are kept cool, and until it all escapes they will not ignite, thus requiring considerable time for lighting.

The Wilson lighter is instantaneous; the spark can be transmitted from burner to burner, through the entire circuit, at least one hundred times per minute, igniting the gas the moment it is emitted from the burner, no matter how small the quantity.

SAFETY.—The Gardiner lighter entails great waste of gas, endangering both the health and safety of those wherein it may be operated. The gas is turned into a pipe containing several sections of burners, which must be lighted in turn, in consequence of which there must necessarily be a very great amount of gas emitted unburned, before the battery can be applied to all; a considerable quantity of gas being also lost during the expulsion of the air from the pipes, as the coils are then being cooled, and ignition is impossible until a full flow ensues, as hereinbefore shown. These facts demonstrate the necessity of lighting up a long time before required for use, in order that the escaped gas should work off; thereby a great and additional expense is incurred. A careful observation of the length of time required in the operation of lighting shows a waste of gas, in value not less than $4 80, which, properly, should be added to the annual cost, heretofore shown.

Probably not the worst feature of this waste is the vitiation of the atmosphere, which all therein engaged have to breathe, as there is in this method, under the most favorable circumstances, a great escape of gas, arising from so great a number of burners being so tardily lighted, and, as the lighting process is frequently performed during the sitting of the House, the possibility of explosion is a subject of the gravest importance, the disastrous result of which can only be estimated. Comparing the relative strength of ceiling and roof, in all probability the force of an explosion would precipitate the entire glass panneling into the hall below. It is a fact well known in chemistry that a highly explosive mixture is produced by a combination of 15 to 20 per cent. of coal gas with atmospheric air; therefore any plan necessitating an escape of gas for four or five minutes, from so many burners in so confined a space as that in which they are located, would make an explosion not only possible, but probable. This danger would be greatly increased, in fact, rendered almost inevitable, should there be a simultaneous destruction of coils in two or three of the sections of burners, in which event all on those sections would fail to ignite, and the gas flow until it be lighted by other means.

The Wilson lighter entails absolutely NO WASTE OF GAS. There being no circuits to break, nothing about its paraphernalia of a destructible character, the performance of its office is inevitable, the sparks of electricity being transmitted through the burners many times each second, ANTICIPATING the flow of gas. The ignition would be instantaneous, however, if the gas reached all the burners at the same instant.

Your memorialist would respectfully submit that all the difficulties which are, sooner or later, sure to arise in the use of the heated platinum wire, are overcome by adopting the electric spark generated by the induction coil used in connection with a few small cups of Smee's battery, which constitute Wilson's lighter. This arrangement will do the work of the 160 cells, as now applied by Gardiner. The only part that can wear out is the battery; and as 160 pairs of plates, other things being equal, wear out just as soon as 12 pairs, by such a reduction in the number of plates used, and in the time of their employment, the expense of keeping a battery in operation is almost annihilated.

Your memorialist would respectfully call the attention of your honorable body to the fact that, upon the request of the chairman of the Senate Committee on Public

Buildings and Grounds, Professor Joseph Henry made a report upon the relative merits of the two lighters, highly favorable in its terms to the Wilson method. He would also refer you to the following extracts, taken from a report of a commission, appointed 31st of October, 1865, by the Secretary of the Interior, composed of Professor Joseph Henry, Charles G. Page, and James H. Simpson, lieutenant colonel engineers United States Army, to examine and report upon the Gardiner apparatus, now used in the Capitol. Said report, dated 26th April, 1866, is now on file in the Interior Department; and also would beg leave to submit, as evidences of the stability and economy of the Wilson apparatus, the following testimonials, selected from many of like character, furnished him by the proprietors of buildings in which the lighter has been for years, and is now, in practical operation.

The lighter has been recently introduced into the Corcoran Art Building, of this city, to the entire satisfaction of the founder:

Extracts from the Henry, Page, and Simpson report.

"To heat to redness a single fine wire of platinum, such as is used to kindle a gas jet, requires but a very small quantity of electricity; but when the same current is used to heat, simultaneously, a large number of wires, the power required necessarily increases in a geometrical ratio—a consideration which, in the opinion of the commission, ought to have militated very much against the choice of this method.

"The electrical power which has been provided for kindling the gas in the dome, and operating the stop-cocks, consists of 200 large glass jars, each containing six gallons of diluted acid, and two plates of amalgamated zinc, each 9 by 10 inches, and a plate of platinized carbon of same dimensions. The power of this apparatus is derived from the combination of the zinc and of the acid, in which process both the zinc and the acid are continually consumed. Even the platinum wires, under the operation of an intense galvanic current, are dissipated in the form of a fine powder, and in time will also require renewal.

"The cost of supplying the materials constantly consumed in the batteries will, according to the prices which have been charged in the accounts submitted to the commission, amount at least to $2,500, and if to this is added the salary of an electrician, competent to repair and adjust the work, as estimated by Mr. Gardiner, at $2,500, the annual expense will be about $5,000.

"The commission have witnessed, on two occasions, the kindling of the gas by means of the electrical apparatus, and find, contrary to what they were led to suppose before examining the arrangements, that all the jets are not lighted at once, as it were, by a single flash, but in sections of about 30 at a time, so that from 10 to 15 minutes are required to complete the illumination of the dome, and in both cases several of the jets were not ignited upon the first application of the electric current, from which it is inferred that the platinum wires are liable to displacement, and it is evident that, from their present exposure, it will be difficult to guard against such a contingency.

"In this connection it is proper to state that, however interesting the exhibition may be of the instantaneous lighting all the jets by a single discharge of electricity, or in rapid succession by means of the flash tube, caution should be used, previous to definite experiments on this point, in opening at once all the stop-cocks, since an accumulation of gas in the tholus, or any portion of the dome, to the extent of from 15 to 20 per cent. of the volume of atmosphere, would form an explosive mixture, and endanger the whole structure."

TESTIMONIALS.

"HARTFORD, CONN., *February* 3, 1870.

"It is now eight years since Allyn's Hall has been lighted by Wilson's electric gas-lighter; it has been in constant use for at least four nights in each week during that period, and has given the most perfect satisfaction. The time saved by this method in lighting a large hall will essentially reduce the quantity of gas consumed, which would otherwise be suffered to escape during the time occupied in lighting up.

"It gives me great pleasure to assure you of the satisfactory results experienced from the continued use of your electric gas-lighter.

"JOHN ALLYN."

"NEW YORK, *January* 29, 1870.

"This may certify that the method of lighting gas by the electric spark, from an induction coil known as Wilson's patent, has been in use in the lecture-room of the Cooper Union for a number of years with the most complete success. Among its excellencies are the simplicity and comparative durability of its fixtures, the comparatively small battery power required to work the coil, and the certainty of its operation under ordinary care and attention. Its use for any time in any public hall or lecture-room will render it almost an indispensable necessity, as it is now regarded here.

"CHARLES S. STONE,

"*Professor Chemistry, &c., Cooper Union, New York.*"

"BOOTH'S THEATER, NEW YORK, *March* 31, 1870.

"The Wilson electric gas-lighter has been under my charge one year; it lights 900 burners in the auditorium, and has never failed once. The chandelier is turned off and relighted five times during the performance. It saves about $50 a week in gas. The expense for battery is $12 for one year. I consider it a perfect success.

"JOSEPH SCOLLEN, *Engineer.*"

"Wilson's method of lighting gas by the spark of electricity obtained from the induction coil of Rhumkorff is a most useful and ingenious application of electricity, and is now so generally known and highly appreciated as to require neither encomiums nor any description. I believe Mr. Wilson's method was original with himself, having been covered by a patent from the United States. I have mentioned Mr. Wilson's method, in connection with the induction coil, in my Physics, published in 1861.

"B. SILLIMAN,

"*Professor Chemistry, Yale College.*"

Your memorialist proposes to your honorable body to furnish for the hall of Representatives, dome, and rotunda, an apparatus of the most substantial character, and to apply it in the most workmanlike manner, for the sum of fifteen thousand dollars, ($15,000.)

Very respectfully, your obedient servant,

F. C. CLARK, *Agent.*

MR. GARDINER'S STATEMENT.

To the Hon. THOMAS A. JENCKES,
Chairman of Committee on Ventilation:

I would respectfully submit for your consideration the following statement as a partial answer to the memorial of F. C. Clark:

Mr. Clark asserts in his memorial that the Wilson lighter was adopted by the Senate to light the burners over the Senate chamber during the previous session of Congress, after a thorough comparison of its merits, as compared with my invention. I can positively assert that no such comparison ever took place, as no member of the committee who reported the bill ever called on me for any information concerning my apparatus.

Mr. Bogart, for whose benefit the bill was reported, claimed to be the sole agent for introducing the Wilson lighter, and although I am aware there was some trouble between Mr. Bogart and Mrs. Wilson, widow of the inventor of said lighter, I cannot assert that the agency has been transferred to F. C. Clark, but would most respectfully suggest some inquiries be made as to who really is the agent for said lighter.

Mr. Bogart, in pressing the lighter on the notice of the Senate, claimed in his memorial as a fact that he would light all the burners in the Senate chamber at one flash, the same as Mr. Clark seems to claim he would do in the House of Representatives. But Mr. Bogart, in closing the contract with the architect, Mr. E. Clark, distinctly states that he will light each panel separate, the same as I now do in the hall. Mr. Clark would no doubt have to do the same thing.

The Wilson lighter has been taken out of the picture gallery of August Belmont, esq., for two reasons: first, it was a nuisance on account of the offensive smell from the battery used; secondly, it would not do the work as claimed for it. It has also been taken out of Cooper Institute, and has been abandoned by the proprietors of Steinway Hall as a perfect and complete failure, after giving it a fair test for three months.

The lighter was put in the picture gallery of Belmont by Messrs. C. T. & J. N. Chester, a firm thoroughly competent to do the work, and men who have had a large experience in all kinds of work where electricity is employed. It was put in the Cooper Institute by the inventor himself; and when they could not make it work successfully, it does not seem possible that Mr. Clark, who has had no experience in the business, could make it a success, more especially when there is at least five times the number of burners in the hall of Representatives that there was in either of the places named.

Mr. Bogart placed the lighter in both Steinway Hall and Booth's Theater, New York. In the hall it proves a complete failure; in the theater it misses from ten to thirty burners every night. That is the record of the success of Mr. Bogart in placing the Wilson lighter in working order.

For a report of the only complete and impartial test, as between the merits of the Wilson lighter and my invention, I respectfully refer you to the report of the board of managers of the American Institute, and the decision of committee appointed by the said board to decide on the relative merits, both the board of managers and the committee awarding me the two first medals and diplomas, after a test of seven weeks, during which time the models stood side by side.

But allowing the Wilson lighter to be a perfect success in lighting, (which I deny,)

by what right does F. C. Clark assume to put magnetic engines in his estimates, as for the purpose of turning on and off gas by electricity, when I hold five patents on the magnetic engines as used for that purpose, the first of which was granted in 1858, and for improvements as follows: 1st of May, 1864; 9th of June, 1866; 4th of September, 1866; 19th of February, 1867? I also hold the exclusive right to use lava tips, or any other insulating tips, as applied to gas-burners where electricity is used to light the gas; and that fact must compel Mr. Clark to use metal burners, the natural consequence of which would be their corrosion, the same as was the case with the flash-tube when used in the hall of Representatives. I refer you to House Report 31, second session Fortieth Congress.

Mr. Clark seems to lay considerable stress on the report of Professor Henry. Henry's report was never accepted by the Secretary of the Interior, being considered irrelevant to the object for which that committee was formed, viz: an inspection of the work as done by me in fitting up the dome by my invention.

Allow me to give you two reasons why the carrier or flash-tube was not employed in the lighting the dome:

To light the dome by the tube would require eight lines of 2½-inch gas-pipe running from the flooring to the different tiers, each line with stop-cock attached, which would be a most unseemly looking affair on the inside wall of the dome, and the corrosion that would inevitably take place in the nipples would cause an expense of not less than $1,000 per annum to clean. True, the carrier tube could have been touched off at the different tiers, but that would compel the operator to descend a rope to the first cornice—a rather dangerous operation, especially at night.

As to the durability of the platina coils, I have no hesitation in asserting that where they are inaccessible they will remain for years without requiring any renewals whatever; for instance, the old hall, where there are fifty-six burners in exactly the same condition and with the same platina tips that were placed there three years ago, the House of Representatives has not had but eighty new platinas during the time my invention has been used there, and every one of them was broken by the workmen employed there last summer. I have no hesitation in asserting that from three-fourths to nine-tenths of all platinas renewed in the dome have been rendered necessary by breakages caused by the laborers during the annual cleaning of the dome.

As regards the expense attending my battery, Mr. Clark has no doubt shown a large array of figures; but it happens they are not all chargeable to my battery. For the three years he takes as his basis the actual amount of acid used by me was $250 85 as against $459, charged by him; he also charges me with $1,842 40 for forty cells of my battery, which he says have been consumed, but which I am happy to say are still in my charge, less a few of the jars broken. The only reason that I do not use the two hundred cells is, that I find one hundred and sixty quite enough to do the work. I do not think the salary of myself and assistant can be charged as material, which would make a considerable difference in the annual expense, as, no matter what method of electric gas-lighter is used, it is imperative to have an electrician to take charge of it.

All the material actually used in my battery amounts to $2,038, making an annual average of $509, as the material has actually lasted four years up to November, 1870, and will last from two to three years more. All of which I respectfully submit to your consideration.

SAMUEL GARDINER,
Electrician.

MR. GARDINER'S STATEMENT—No. 2.

Hon. THOMAS A. JENCKES, *Chairman of Committee on Light, &c.:*

DEAR SIR: I will only make a few remarks in addition to my statement already before you, and will make them as brief as possible. In the statement of F. C. Clark, that I placed my electric gas-lighting apparatus in the Broadway Theater and that it was a failure and abandoned, I will state to you that I placed it in the Broadway Theater, and that it worked every night with perfect success, never having made a failure, and the apparatus remained in said theater until the building was taken down to make room for a block of fine stores. I will refer you to C. S. Marshall's sworn statement as to its perfect success. (Certified copy from the Commissioner of Patents, marked A.)

Mr. C. S. Marshall was the proprietor of the Broadway Theater until the building was taken down. As for F. C. Clark's statement that Mr. Chester employed me to put the electric gas-lighting apparatus in August Belmont's picture gallery, and that I had operated the same, is not true. The Wilson electric-spark apparatus was placed in August Belmont's gallery in Fifth Avenue by the Messrs. Chesters. I had never been in Mr. Belmont's house until Mr. Chester invited me to go with him to see the workings of the Wilson apparatus. The Chesters lighted it up; a number of the burners missed to ignite; they were carefully adjusted and another trial was made, and

others again would fail to light. Mr. Chester then informed me that it had been in operation several weeks, and at times he would succeed to light all the burners, and then again a portion would not ignite. I informed Mr. Chester that Mr. Wilson, the inventor, had the same trouble, viz: the difficulty of insulation and the changes of the temperature would cause the spark to take various directions, and that the same adjustment would not answer in all temperatures. Mr. Chester informed me that he had more trouble with it than it was worth; that he had already expended more money than he was to get for it, and wished me to take it off his hands and introduce my apparatus. I declined to do so, and never put my electric gas-lighting apparatus in August Belmont's gallery, or ever worked the Wilson lighter in said gallery. It was a perfect failure in Belmont's gallery, and Mr. Belmont ordered it taken out, which the Mr. Chesters did, and did not receive one dollar for their trouble. I will refer you to Mr. August Belmont's letter of February 9, 1871, marked B.

In regard to Steinway Hall, the Wilson patent was placed in said hall two or three years since, and they had it in operation some three months; it failed so often to light the burners, and so much trouble to keep it in order, that it was abandoned after three months' use as a perfect failure. I will refer you to letter of Mr. Bartlett, dated New York, February 3, 1871, marked C.

Booth Theater: the Wilson spark-lighter has been introduced, and it fails every time it is lighted to ignite all the burners, and hand-lighting has to be resorted to. Refer you to letter marked C.

At the Cooper Institute, where it was placed by Mr. Wilson himself, it was used for a time, and it failing to light the large number of burners required, was taken out and a portion of the apparatus was placed in the lecture-room of Professor Stone, in same building, where, under the management of Mr. Stone, with a small number of burners required to be lighted, makes it answer his purpose. The Music Hall, New Haven, often fails to light all the gas-burners, and on several occasions some of the burners remain unlighted all the evening.

As regards my electric gas-lighting apparatus, it was placed in A. T. Stewart's house, New York, some three years since, and has always lighted the burners with perfect success, there being some three hundred and twenty-five gas-burners in his picture gallery alone, Mr. A. T. Stewart being so well satisfied with it that six months after he closed a contract with me to put my electric gas-lighting apparatus in his store, corner of Broadway, Tenth street and Fourth avenue, lighting over two thousand gas-burners. One year and a half after I had finished his store, and having a successful trial all that time in lighting the gas in his store, Mr. A. T. Stewart closed another contract with me to extend my gas-lighting apparatus to his new addition on Broadway and Ninth street, which I completed over one year since, and is now in successful operation every night. I will refer you to letter marked C, dated February 3, 1871; also to certificates marked Nos. 5 and 6.

In the Academy of Music, New York, it was placed only to the border light, to produce a sudden effect on some scenery in Ullman's opera. It worked with perfect success until the close of his engagement, some eight months. The building was closed for over a year, and soon after the building was burned.

* * * * * * *

As regards the perfect success of my electric gas-lighting apparatus for the past five years, it is well known to all the members of Congress. It has never made a failure in the whole five years, and is now at this time working with perfect success. As regards the expense which Mr. F. C. Clark states, I have admitted that the zinc, carbons, quicksilver, platina tips, chloride of platina, and the larger portion of the acid is correct, which amount, taken for the average of five years, will not amount to over $500 per annum. F. C. Clark attempted to swell up a bill of expenses which did not belong or chargeable to the battery. In one case, where Mr. Edward Clark, architect, made a change of running the whole line of wire belonging to the dome in another direction, and where an entirely different kind of wire was used, and a large quantity was required, is charged to battery account; also where a change had to be made in the dome indicator to accommodate the lighting of the rotunda, that was charged to battery account; also a large quantity of glass globes furnished for the old hall of Representatives was charged to battery account. Cockroach powders, boxes of soap, and other articles were charged to battery account, which I have had nothing to do with, as I have said before that the sum of $500 is about the average cost of maintaining the battery for the last five or six years. I am sorry that so much of your valuable time has been taken up with this personal quarrel of Clark and myself. I have been obliged to defend my rights. I would be most happy to have the committee visit my department and examine for themselves the battery and the gas-lighting apparatus, as they will have the opportunity to see the magnetic engines, indicators, the electric lava-tip burners, and everything pertaining to the lighting gas by electricity.

Most respectfully, your obedient servant,

SAMUEL GARDINER,
Electrician.

Hon. THOS. A. JENCKES,
Chairman on Lighting and Ventilating the Halls of the Capitol:

TURNING ON GAS, ETC., BY THE AID OF ELECTRICITY.—Patented December 22, 1857.

The object of this invention is to control and regulate the supply of gas to burners by a mechanism operated by electricity.

The object of my invention is to bring the service or supply cock by which the gas is supplied to a number of burners that are to be lighted by electricity, to be opened or closed or made to regulate the supply to the said burners, under the control of a person at a distant part of a building or other place; and to this end my invention consists in furnishing the service or supply cock with a ratchet wheel, or its equivalent, to be engaged by a pawl or dog, or the equivalent thereof, attached to one end of a lever whose opposite end has attached to it the armature of an electro-magnet.

Claim.—I do not confine myself to the particular method herein described of accomplishing my object, but having thus described the construction and operation of my invention, I claim broadly turning on or shutting off inflammable gas by degrees or gradually, through the agency of electricity, for such purposes as are hereinbefore alluded to.

(Refer to patent dated June 19, 1866, for turning on and off gas.)

DIVIDING THE CURRENT OF ELECTRICITY.—Patent dated November 29, 1864.

There is great difficulty in lighting a large number of gas-burners by passing one continuous current of electricity through a number of platina coils, the resistance being so great that the galvanic battery could not act or generate the electricity to its full extent. I have found by experiment that to divide the current by having several smaller wires leading from the main conducting wire to several sections of gas-burners to be lighted, that I could light a much larger number of gas-burners by the same current of electricity generated by a galvanic battery. By actual experiment I have found that where I could light but ten gas-burners by having only one continuous current, by dividing the current into ten sections I could light one hundred gas-burners by the same current passing over the main conducting wire from the galvanic battery. It makes no difference if the connection of the several smaller wires are brought in connection with the main wire at the switch, the result is the same.

I claim dividing the current of electricity generated by a galvanic battery into several circuits, as herein specified, for the purpose of lighting a large number of gas-burners by electricity.

GENTLEMEN OF THE COMMITTEE: You will see at a glance that my claim for turning on and off gas through the agency of electricity is broad. If, as has been suggested, that other power would be used to turn the gas-cock, you will see that the parties would have to infringe upon my patents, as they could not bring the other motive-power into action for the purpose of turning on or off the gas without the agency of electricity. You have my several patent papers before you, and any other information you may require please send for me, and I will be most happy to give it to you.

Respectfully, your obedient servant,

SAMUEL GARDINER,
Electrician.

Hon. THOS. A. JENCKES,
Chairman of the Joint Committee on Ventilation:

Mr. Gardiner's reply to my memorial seems directed, so far as the claims made for the superiority of the Wilson lighter are concerned, entirely to those alleged to have been put forward at some past time by Mr. Bogart, my predecessor in the agency for this apparatus. In doing so he said that Mr. Bogart had declared before the Senate Committee on Public Buildings and Grounds his ability to light *all* the burners by one flash, but that after the appropriation was made, and Mr. Bogart came to make his contract, he was unable to conform to his alleged declarations, and contracted to light but a square at a time, just as he, Mr. Gardiner, did now.

He also denies my statement that the Wilson lighter had been adopted by the Senate after an investigation of the merits of both methods. I would, as confirmation of my representations, and as a denial of Mr. Gardiner's statement, call the attention to a brief recital of the facts relating to this point.

During the first session of the Forty-first Congress, Mr. Gardiner caused a resolution to be offered in the Senate asking for an appropriation to enable him to extend his apparatus to the burners over the Senate chamber. This resolution was referred to the Committee on Public Buildings and Grounds. Soon thereafter Mr. Bogart memorialized the Senate, asking for an appropriation to put in the Wilson lighter, which was referred to the same committee. They were, in consequence, both before that committee. Mr. Gardiner and Mr. Bogart both appeared and urged their respective claims, and finally, on the 13th day of July, 1870, the following debate upon the report of that

committee upon the subject took place in the Senate, as taken from the Globe of that date.

"Mr. MORRILL, of Vermont. I am directed by the Committee of Public Buildings an Grounds to report the following amendment:

"'For materials and putting up the Wilson Electrical Gas-lighter in the Senate chamber, $4,500: *Provided*, The same can be done under the control of the Architect of the Capitol Extension during the recess, and at an expense not exceeding the amount herein appropriated'

"I will state that the committee have fully examined this matter, and I think the operation here was exhibited to most Senators. There is no question about the rapidity of the lighting, or the saving of gas, or about its being less dangerous from explosion.

"Mr. NYE. I simply wish to say that I am informed by the electrician, who lights the other House, that the whole building can be lighted just as well from his apparatus, and at a very small expense. It seems to me it would be better to have the whole thing under one head instead of having it under two heads.

"Mr. MORRILL, of Vermont. It will not cost $5 to keep this in repair. For the other it requires a master workman and a journeyman. It has been tested recently in this city in Corcoran's Gallery, and I believe there is no sort of doubt as to its being an improvement on the process used by the House of Representatives.

"Mr. NYE. Will it cost any more to let the present electrician, who lights the other end, compete for this?

"Mr. MORRILL, of Vermont. Until competed with, he wanted more. He wanted $10,000 until this man offered it for less, and then he agreed to take something less.

"The amendment was agreed upon."

It is simply impossible that Mr. Gardiner's statement can be correct in the face of these proceedings, and furthermore, as the letter heretofore referred to by me as given to that committee by Professor Henry, now on file with that committee, treats of the two methods comparatively, thus showing that the committee considered both plans. Mr. Gardiner furthermore declared himself to me verbally, several weeks prior to the making of the appropriation, that he was confident of success.

Now, as to what Mr. Bogart's representations were before that committee, I know not, nor is it pertinent here. Mr. Gardiner's whole argument on this point appears to be devoted to tearing into tatters a person who is not before the committee nor any of the representations made by that person on behalf of the Wilson lighter; furthermore Mr. Gardiner, knowing that he is not here, or his representations, at least the only one alleged to have been made by Mr. Bogart, viz, "his ability to light *all* the burners by one flash," has endeavored to connect them to me by assuming he supposes that I propose to do the same thing. I will merely say to him that Mr. Clark has not proposed to do anything of the sort; that what he has proposed to do is to simply light all the jets so soon as the gas is emitted from them in sufficient quantity to ignite, and to do it in an economical manner. Whatever Mr. Bogart may have declared his ability to be on this point, I know not, but it seems he was able to demonstrate the superiority of the Wilson lighter to the satisfaction of the entire committee and the Senate.

I do not propose to occupy the time of the committee needlessly, but propose to briefly refer to a few statements made by Mr. Gardiner at issue with the facts.

He has declared that Wilson's lighter has been "put out" of August Belmont's picture gallery, Steinway's Hall, and Cooper Union, because of inefficiency and smell from the battery; so far as the smell of battery is concerned, Mr. Gardiner is well aware that the style of battery applied to Wilson's method is identically the same as used by him, only much smaller in size; and I would, in all conscience, ask what force there is in such an argument, even if it existed in fact, so far as it would operate in this building, where he has one hundred and sixty cells of six gallons where we would have but twelve of less number of gallons? But I will state to the committee that which Mr. Gardiner does *not* know, this battery can be, and is, under our process, rendered perfectly inodorous, as can be demonstrated at the Corcoran Art Gallery. The facts in regard to the Belmont picture gallery are these: Wilson's apparatus was put there by the Chesters, of New York; they put Mr. Gardiner there to arrange or work it; the result was, as might be foreseen; Wilson's apparatus went out, Gardiner's went in; neither are there to-day. Steinway had Wilson's apparatus, but it was not put out for any other cause, as explained to me by Mr. Steinway himself, but because, unknown to them, the janitor had neglected the battery, and owing to the battery having been put near the roof, where it was affected by the frost, and also immediately thereafter they raised their roof, and that the apparatus was not thereafter re-affixed to the burners; that they had proposed to re-attach it.

As to the Cooper Union, the Wilson lighter is still in that building; it was originally put in the large hall of that building in 1859; it continued there until 1862; was then taken down from the burners there, and attached to the burners of the chemical lecture-room, where it has operated ever since, and is now; the cause of the change was the desirability for use before the classes of the unusually fine induction coil belonging to it.

Mr. Gardiner carefully avoids every reference to the fact that his lighter has been in other places than in this Capitol and in A. T. Stewart's, New York; or that it has been abandoned for inefficiency. It was in Broadway Theater, New York; was not used after a short period; it was in the Academy of Music, New York; was taken out; it was in Belmont's gallery, the house of Captain West, of this city, in Chicago, Illinois, where it was abandoned, after great expenditure of time and money in endeavoring to obviate its faults of want of reliability, durability, and its excessive expense; besides in other places which I might mention; and the fact stands out, save only behind the General Government and the princely income of Mr. A. T. Stewart, does it exist to day, and I will add here that I expect by return mail an affidavit of John Kellum, architect, who has in charge all such matters belonging to the business of Mr. A. T. Stewart, (a testimonial from whom was read by Mr. Gardiner,) to the effect that he was only debarred from contracting with Mrs. Wilson's former agent for her lighter for Mr. A. T. Stewart's new store, in lieu of Gardiner's, now in use, because of the agent's exorbitant price. I will add, also, that upon Mr. Kellum's attention being called to the testimonial read by Mr. Gardiner, he expressed great surprise, and said he would much like to see the original before admitting that he had signed such a paper.

But Mr. Gardiner, in enumerating the two solitary instances in which the Wilson lighter is not operating, avoids any reference to the Boston Theater; Peck's Music Hall, New Haven; Allyn Hall, Hartford; Cooper Union chemical lecture-room; Corcoran Art Gallery, Washington; where it has operated covering a period from eleven years to six months; but he does declare, as regards its operation in Booth's Theater, New York, that forty burners fail at a time upon the chandelier, a statement unsustained by any attempt at evidence in the face of the declarations of Mr. Edwin Booth and his gas engineers.

Mr. Gardiner attacks the metal burner used by Wilson, because of alleged corrosion and expense. I will say that this burner, so far as regards the tip from which the gas exudes, is in no respects different from the common metal burner in general use in buildings of all kinds, both large and small. Scores are used where one lava-tipped is used, and have been, doubtless within the knowledge of your committee, without the evils attributed to them by Mr. Gardiner. He has offered as corroboration of his statement the report of the Committee on Accounts of House of Representatives. I will call the attention of the committee to that report. * * * It will be seen that the remarks therein refer solely to the small nipples of the traveler tube, then used for igniting the service burners, the capacity of which was, with three small orifices, only one cubic foot per hour, and in no way referring to the regular metal service burners used for illuminating.

Mr. Gardiner alleges that the Wilson spark is inoperative in a draught. In reply I would say that probably no severer test can be offered than that of the lights in a theater, the draughts caused by the rising of the curtain being greater, probably, than elsewhere. Wilson's lighter has triumphantly vindicated itself in this respect in the two largest theaters in this country. I would ask which would probably be the most likely to be affected by a draught, a fine, heated wire, or the irresistible spark produced by an induction coil?

As regards the expense for maintenance of his apparatus, Mr. Gardiner has utterly failed to meet my statements save by the bald assertion that all the material charged in the certified statement furnished were not all for the Capitol apparatus. I would ask him what apparatus were they for. Look at the items. Are there any objects in this building to be paid for out of appropriation for the support of this apparatus that require acids, quicksilver, platina coils, chloride of platinum, zinc plates, carbon plates, battery jars, insulated copper wire, insulators rubber and clay, binders? For these kind of materials the statement of expense I have submitted, certified by the signature of the Secretary of the Treasury and the seal of that Department as a true copy of the vouchers, shows that for the three years acid cost..... $588 38

Mr. Gardiner asserted but $250.

Quicksilver	235 33
Glass battery jars	268 35
Amalgamated zinc plates	705 30
Platinized carbon plates	355 45
Platinum coils	315 00
(Yet Mr. Gardiner said but eighty had been replaced; this $315 was for 315 tips.)	
Brass binders	30 00
Chloride of platinum	82 00
Insulators, rubber and clay	75 00
Insulated copper wire	491 35
Sundries, such as tools, freight, &c	90 61
Total	3,236 77

Yet Mr. Gardiner says the materials cost in the three years but $1,800. I challenge him to show an item of that certified statement that was not obtained upon his requisition. General Michler is not in the habit of getting material for one thing and charging it to another. In addition to the above, $217 15 has been paid during that period for cleaning the apparatus. I take it that there is no going behind the certified documents. I will conclude this point by saying that Mr. Gardiner has not attacked the Wilson method on this score, and that yet, in the face of these figures, readily obtained, the Committee on Accounts, in 1868, were made to say that the apparatus "had cost in the way of repairs but $60 per annum."

I shall trespass but a few moments longer on the patience of your committee, but beg leave to touch upon the subject of right to turn on gas by electricity, which Mr. Gardiner claims he has the sole right to do. I will not dilate upon this point, but be content to submit the papers and letters-patent to your honorable committee, feeling confident that you will correctly judge upon that point.

One other point and I am done; it is this: Mr. Gardiner has submitted as rebuttal of the Henry, Page, and Simpson report, a report made by Shaffner, Pike, and Knight, stating that the Henry report was ignored by the Secretary of the Interior, Mr. Harlan, because it went further than was intended. I do not doubt it did go further than Mr. Gardiner wished it, as the sequel proved. The facts are these: the Henry report was not ignored by Secretary Harlan, but was filed in the Interior Department; it caused a stoppage of Mr. Gardiner's claim; an investigation of certain matters connected therein, by Dr. Page, through the orders of the Secretary of the Interior; it eventuated in cutting down his vouchers some $6,000 or $7,000. I herewith offer to the committee certified copies of the correspondence on the subject. Now for the Shaffner report: It will be observed the Henry committee was appointed by the Secretary of the Interior; the Shaffner committee was appointed by Mr. B. B. French, then Commissioner of Public Buildings and Grounds, and was essentially a white-washing affair. Mr. Shaffner testified under oath, very unwillingly (a certified copy of which I have sent for to the court in New York, and will doubtless receive in the course of a couple of days, and propose to place in your hands) that Mr. Gardiner appealed to him to sign this report, because the Henry report had stopped his money; that he, Shaffner, did so after great importunity; that he had never met any committee to view the apparatus; that the report was drawn up by the third man on the report, Mr. Knight, who was Mr. Gardiner's attorney; the other man, Nicholas Pike, he did not know. As to the premium at the Institute fair, upon which Mr. Gardiner has laid so much stress, I will merely say that at a former exhibition of the two methods, during the life of the inventor, before the same Institute, Mr. Wilson took the prize, viz, a gold medal. I conclude by expressing my thanks on behalf of Mrs. Wilson, as well as myself, for the courtesy and kind attention of your honorable committee.

Very respectfully,

F. C. CLARK.

APRIL 4, 1868.—Mr. Broomall, from the Committee on Accounts, made the following report:

The Committee on Accounts, who were instructed by resolution of the House of February 22, 1868, to inquire into the expediency and the expense of causing the gas over the hall to be lighted by electricity, from the battery now used for lighting the rotunda and dome, make report.

The mode of lighting the gas over the hall now in use is this:

A pipe called a carrier tube, about one inch in diameter, in which are inserted at intervals of an inch small jets or burners passes the burners which light the hall, and when fire is communicated to the jets at one end, it passes from jet to jet and lights the burners.

The proposed mode is to put a wire in the place of the carrier tube and connect it with the galvanic battery used for lighting the dome, so that the electricity being communicated to the wire will immediately light the burners as soon as the gass is emitted. After careful investigation the committee are of opinion that the following advantages will result from the proposed change:

1. The expense of keeping the carrier tube and jets in order will be saved. This expense is shown to the satisfaction of the committee to be about $800 or $1,000 a year. There are 9,670 jets or small burners in the carrier tube. To prevent the extravagant use of gas, these jets are very small, eight of them emitting about a cubic foot of gas per hour. By the decrease of the size of these jets, their liability to become obstructed and out of order is increased. The obstruction of a single jet frequently stops the progress of the fire. Two jets together obstructed almost always stops the

communication. Hence, the jets require frequent cleaning and removing. This constitutes the great item of expense attending it.

The annual cost of the proposed substitute will be very little.

The entire expense of the similar apparatus for lighting the rotunda and dome in the way of repairs is about $60 a year.

2. The waste of gas during the time required to light by the carrier tube will be prevented and the amount used by the carrier tube saved.

The time occupied in lighting is about ten minutes. The amount of gas consumed by the 1,260 6-foot burners is about 6,000 feet *per hour*, and that used by the jets about 1,200 feet, making the amount used by both about 1,200 feet in ten minutes, costing, at the present rate, $4 20 per evening.

Assuming the number of evenings during which the hall is lighted to be thirty per annum, the number during the past year, and the expense saved on this account would be $136 annually.

3. Much of the gas discharged by both jets and burners during the time of lighting is not consumed, but, as every member of the House knows, is suffered to escape and pervade the atmosphere of the hall, rendering it for some time not only unpleasant to breathe, but very injurious to health.

4. By the present mode it is necessary for the person lighting the hall to remain in the place where the lights are during the time of lighting, to attend to the carrier tube, and prevent the flame from stopping by reason of obstructed jets.

This is not only pernicious to the individual so compelled to breathe the noxious atmosphere, but dangerous both to him and the occupants of the hall. The effect produced upon him is often that of partial insensibility, and the consequences of falling in such a place may be easily foreseen.

The recent accident by which a member and an ex-member of the House were injured by the falling of broken glass, was attributed to this cause.

These are the material advantages of the proposed change, and in the opinion of the committee they are sufficient to justify it.

If the proposed mode of lighting should be adopted, the committee would recommend other changes. The present burners are metallic, and hence liable to corrosion. Many of them are already so corroded as to require renewing; probably all of them will require it within the next year. The committee have examined the lava-tipped burners used in the dome, and are satisfied of their much greater durability than metallic ones, and of their entire freedom from corrosion. It is only while a metallic burner is new that its action is perfect—that the whole of the gas emitted is consumed, and consumed to the best advantage. The lava-tipped burners, on the other hand, remain the same.

From some experiments made by the direction of the committee, it has been shown that the horizontal direction of the present burners prevents, to some extent, the proper combustion of the gas, and hence fails to attain all the light of which the gas is capable.

These experiments have shown that twenty-two upright burners placed immediately over the large sash in each of the panels, will produce as much light as the twenty-eight horizontal burners placed as they now are.

By this change two hundred and forty-six burners may be saved, and counting six hours to the evening, and thirty evenings to the year, the amount saved would be about $137 per annum on this account.

Throwing aside the danger to health and life of the present mode, the committee are of the opinion that the actual saving of expense by all the proposed changes would be about $1,000 per annum.

The committee further report that the expense of changing the mode of lighting as proposed, and changing the burners and their position, will not exceed $6,600.

And they believe that this expense will be much more than compensated by the annual saving. On this account, and because the committee are satisfied that the proposed change will conduce to the health and safety of the occupants of the hall, they recommend the passage of the following resolution:

Resolved, That the Clerk of the House of Representatives be directed to cause the carrier-tube now used for lighting the burners of the hall to be removed, as well as the burners and the pipe in which they are inserted, and to cause a pipe furnished with lava-tipped burners to be placed in the most advantageous position over each panel, and to be so connected with the battery used for lighting the dome as be lighted therefrom.

Resolved, That the work be done under the direction of the Architect of the Capitol Extension, and that the expense be paid out of the contingent fund of the House: *Provided*, That the same shall not exceed $6,600.

OFFICE OF THE COMMISSIONER OF PUBLIC BUILDINGS,
CAPITOL OF THE UNITED STATES,
Washington City, October 17, 1866.

Mr. Samuel Gardiner, of the city of New York, electrician, was employed, by those having the authority to erect the dome of the Capitol, to light the same by applying his patent electrical apparatus thereto. He entered upon the work with all zeal and vigor, and completed it, so that, when the dome was so far finished as to require lighting, he was ready to light it. He did so, from base to tholus, to the admiration of all who witnessed it. His work was well, thoroughly, and elegantly done, and its operation was a complete, and, I may say truly, a wonderful success—the whole dome being lighted by the manipulation of keys, in a small passage on the floor of the rotunda, in not over three minutes.

Although entirely satisfied with the perfect result of Mr. Gardiner's work, I thought it best to have placed on file in this office the views and opinions of eminent electricians, and addressed notes on the 23d day of July, 1866, to Professor S. F. B. Morse, Colonel Tal. P. Shaffner, Professor Nicolas Pike, and Edward H. Knight, esq., well known to me as men eminent for their knowledge and study of the operations of electricity, and its practical application as a motive and illuminating power, asking them to examine carefully and thoroughly Mr. Gardiner's work, and make a report of their conclusions to me. They proceeded at once to make the examination, and concluded their labors in July, and have submitted a report, to a copy of which I attach this statement. Professor Morse, having left for Europe, has not signed the report, but I am assured, in the letter from Mr. Knight accompanying it, that he "has signified his acquiescence with the spirit of the report." He will probably add his signature on his return.

The report goes so fully into the details of Mr. Gardiner's work, and the manner of its operation, that I need add nothing more than my testimony to that of the committee, that "it deservedly attracts great attention from experts and intelligent casual visitors, from whom the effect of the manipulation of the keys elicits murmurs of applause."

B. B. FRENCH,
Commissioner of Public Buildings.

WASHINGTON, *July* 31, 1863.

SIR: In accordance with your request to report upon the character, efficiency, prospective durability, and cost of maintenance, of the apparatus for lighting the dome and tholus of the Capitol, we have to report that the work has been executed in a handsome and substantial manner, worthy of the people and the place, and is a credit to all concerned.

We take especial pleasure in commending the courage manifested by Mr. Gardiner in bringing his invention to the most crucial test which the country affords by lighting up an interior of the area and height of the Capitol rotunda, dome and tholus.

The gas-pipe connections consist of circles of burners at 45, 80, and 165 feet from the floor of the rotunda, and are furnished with 300, 325, and 425 burners respectively. In addition to these, a cluster of 90 burners is placed in the tholus, at a height of 264 feet from the floor, and, being 60 feet above the crown of the dome, is, of course, invisible from the interior, but is a beautiful object viewed from the Capitol Grounds, and visible at a distance of many miles.

The flow of gas at each tier and in the tholus is equalized by a regulator, and governed by a stop-cock, the latter being opened and closed by electro-magnetic engines in their immediate vicinity, worked from the battery, the central brain of the apparatus, from which ramifies the nervous fluid which vitalizes the motive agents and the illuminating coil of each of the 1,130 burners.

The battery occupies an elliptical room, 45 by 36 feet, and consists of 200 glass jars, of a depth and diameter of about 13 inches, containing two zinc plates, 9 by 10 inches, weighing 6 pounds each, and an interposed carbon plate, all supported by suitable insulators in the acid bath. It is disposed on benches in concentric series in the room, and arranged in sections of twenty jars each, to be brought into service as required.

The connections consist of five miles of No. 10 copper wire, doubly wrapped with linen yarn, and, when necessary, encased in India-rubber tubing. This is securely laid in protecting pipes or through passages drilled through the walls, the return circuit from the engines and the burners being made through the gas-pipes.

The burners used have an indestructible lava tip, which acts as an insulator, and each is provided with an insulated coil of platinum wire, placed on one side of the orifice, so as not to interfere with the free exit of the gas, which is lighted by exposure to the red-hot metal when the electric connection is made.

The tiers of burners are divided into sections of from thirty to fifty burners, each section having independent connection with the instrument; so that a tier being divided

into ten sections, it is lighted by a corresponding number of pulsations following the flow of the gas, which is turned on by the electro-magnetic engine belonging to and in the vicinity of the tier. The manipulation, which by successive pulsations operates the engines, makes the series of illuminating connections, and registers the work, is performed in a passage-way leading north from the floor of the rotunda, and perhaps 50 feet from the battery.

The electro-magnetic engines consist of a double helix with a sliding armature, on which is a latch-pawl, which operates a ratchet-wheel on the axis of the stop-cock. The operator, by a succession of electric connections, works the armature piston, and turns the plug of the stop-cock such a fraction of a revolution as is represented by the number of teeth on the ratchet-wheel.

The handsomely engraved dial-plate of silver has keys, eleven in number, and with a corresponding number of vernices.

The primary electric connection with the battery is made by a stud in the central key, which, by rotation, is made to bring such a portion of the battery into play as may be required, a vernice indicating the extent of battery connection, which takes place in successive sections of twenty jars.

The surrounding keys, ten in number, are equally divided between the duties of turning on the gas and lighting the same at the five levels for which the dial-plate and keys are adapted. But four of these are yet arranged, consisting of the tiers at the elevation of 45, 80, and 165 feet, respectively, and the tholus at 264 feet.

The fifth may be used for a proposed tier at the spring of the dome, or a circle to illuminate the picture, as you may desire.

Each gas-key has a dark and a light segment on its disk, which are exhibited at an opening in the dial-plate, in correspondence with the closed and open position of the stop-cock which governs the flow of gas at the tier represented by the said key.

Each lighting key has a pointer, which indicates on its vernice the extent to which the electric connection has been made in the sections of the tier to which it belongs.

The apparent column of light in the tholus is derived from 90 burners with reflectors and prisms, was designed by Mr. Gardiner, and has a beautiful effect.

The prospective cost of maintenance, so far as it consists in the waste of materials used in the 200-jar battery, may amount to 600 pounds of zinc, 80 pounds of mercury, and 50 gallons of sulphuric acid per annum.

So far as appears to us, the apparatus requires but proper ordinary care and attention to maintain it in effective condition, and the lighting of the burners can be more effectively and economically accomplished by the use of this apparatus than by any other appliance that has come under our notice.

The workmanship of the dial and appurtenances and the electro-magnetic engines is substantial and elegant, and deservedly attracts great attention from experts and intelligent casual visitors, from whom the effect of the manipulation of the keys elicits murmurs of applause.

Many doubts as to the ultimate success of the enterprise have arisen in the minds of persons quite familiar with the science, when the great amount and proximity of the metal in the iron dome was considered, and on account of other difficulties incident to the scale of the apparatus and connections; but these are happily set at rest, and the appropriateness of the exhibition of American enterprise in the nation's Capitol has given zest to the congratulations tendered to the inventor and contractor, Mr. Gardiner.

We have to report, in conclusion, that the work has been well done; its efficiency and practical performance leave nothing to be desired; its permanency may well be admitted, from the solid and honest character of the work; and the economy with which it performs its duty is beyond dispute.

Very respectfully,

S. F. B. MORSE.
TAL. P. SHAFFNER.
NICOLAS PIKE.
EDWARD H. KNIGHT.

Hon. B. B. FRENCH,
Commissioner of Public Buildings, Washington, D. C.

The United States Patent Office, to all persons to whom these presents shall come, greeting:

This is to certify that the annexed is a true copy from the files of this office.

In testimony whereof I, Samuel A. Duncan, Acting Commissioner of Patents, have caused the seal of the Patent Office to be hereunto affixed this 8th day of February, in the year of our Lord 1871, and of the independence of the United States the ninety-fifth.

[SEAL.]

SAM'L A. DUNCAN,
Acting Commissioner.

CITY, COUNTY, AND STATE OF NEW YORK, *ss:*

C. S. Marshall, of Nos. 326, 328, and 330 Broadway, New York City, being duly sworn, says that he is by profession the manager of the Broadway Theater, New York; that he is generally acquainted with the various methods of practically employing galvanic electricity in the arts; that he has carefully examined a new method of lighting gas by means of electricity, invented by Samuel Gardiner, of New York City, which consists in an arrangement whereby on pressing a key the gas-cock is turned and a flow of gas admitted to the burner, while at the same time a current of electricity is made to pass through and heat a platinum coil located immediately above the aperture of the burner, and thus ignite the gas.

Deponent further says that he has adopted Samuel Gardiner's, jr., new invention of lighting gas by electricity in the Broadway Theater in the city of New York. It was put in successful operation in May last; the theater is lighted in thirty seconds instead of taking the time of two men one-half hour to do the same work; it is a saving of gas and time. Often in theaters and large public buildings the gas is turned off or blown out by a too strong current of air passing through the house; by pressing the key the whole is lighted again, without annoying the audience by sending out the gas-man with his torch to relight each burner.

Deponent further says that the general idea of lighting gas by electricity is not new; but, so far as his knowledge extends, the method employed by said Gardiner, viz, operating the gas-cocks by electricity and at the same time sending the current through a platinum coil above the burner, is new.

Deponent further says that by the common mode of lighting gas-burners in theaters and other public buildings there is always a large waste of gas, because many of the burners are so located that the gas must be caused to flow through a large number of them at once, while the attendant can only light them with his taper one by one. The air within the building is also rendered impure by the escape of gas while the attendant is passing around to light the burners.

Deponent further says that he regards said method of Gardiner's as a valuable, new, and useful improvement, and productive of highly important results; and, further, that this opinion is founded upon actual personal experiments with the invention of said Gardiner.

C. S. MARSHALL.

Sworn to before me this 5th day of December, 1857.

W. M. HOOPE,
Commissioner of Deeds.

CERTIFICATES.

WASHINGTON CITY, *March* 1, 1867.

This certifies that Samuel Gardiner's apparatus for lighting the dome of the Capitol with electricity has now been completed, and in successful operation for more than a year, and that the same has not failed when applied to the lighting in a single instance. The whole thing has worked to my entire satisfaction, and to the satisfaction of all in any way concerned in its use.

B. B. FRENCH,
Commissioner of Public Buildings.

WASHINGTON, *January* 9, 1869.

The electrical apparatus of Samuel Gardiner, esq., within mentioned, has worked with perfect success to my personal knowledge to this date. Since I gave the within certificate, the lighting has been extended to the rotunda and the hall of the House of Representatives, with equal success as the dome.

B. B. FRENCH.

ARCHITECT'S OFFICE, CAPITOL EXTENSION,
Washington, D. C., February 10, 1868.

SIR: It gives me pleasure to be able to state that your apparatus for lighting the gas-burners for illuminating the rotunda and dome of the United States Capitol, by means of galvanic electricity, has proved very successful, after a trial of nearly three years. Over thirteen hundred gas-burners are lighted in a few seconds, the operator being at the floor, while many of the burners are nearly two hundred feet from him.

The cost of maintaining the batteries, I must say, has been much less than I at first supposed it would be. I do recommend your method as being convenient and reliable, and admirably adapted to many purposes.

Very respectfully, your obedient servant,

EDWARD CLARK, *Architect.*

SAMUEL GARDINER, Esq., *New York City.*

HOUSE OF REPRESENTATIVES,
Washington, D. C., April 15, 1869.

SIR: I take pleasure in stating to you that your process of lighting the hall of the House of Representatives gives entire satisfaction to all, and I regard it as a great improvement.

Very respectfully, &c.,

JOHN BOYD,
First Assistant Doorkeeper, H. R.

Professor SAMUEL GARDINER, *Electrician, United States Capitol.*

NEW YORK, *February* 7, 1868.

This is to certify that Samuel Gardiner's electric gas-lighting apparatus has been applied to A. T. Stewart's house, corner of Fifth avenue and Thirty-fourth street, and it works with perfect success; the picture gallery alone containing no less than three hundred and twenty-five gas-burners.

JOHN KELLUM,
Architect, 811 *Broadway, New York.*

NEW YORK, *September* 18, 1869.

SIR: This is to certify that I have had charge of the electric gas-lighting apparatus placed by you in the store of A. T. Stewart, corner of Ninth and Tenth streets, Broadway and Fourth avenue, for one year, and that the same works with perfect success, lighting some two thousand five hundred gas-burners.

Yours, respectfully,

NATHANIEL H. ANDREWS,
Electrician at A. T. Stewart's.

Professor SAMUEL GARDINER.

CLERK'S OFFICE, HOUSE OF REPRESENTATIVES U. S.,
Washington, D. C., June 6, 1870.

DEAR SIR: It gives me pleasure to state that your method of lighting the hall of the House of Representatives, adopted some two years ago, has given entire satisfaction in all respects. It has cost the Government nothing whatever for repairs to gas-burners since the adoption of your improvement.

Very truly yours,

CLINTON LLOYD,
Chief Clerk House of Representatives United States.

SAMUEL GARDINER, Esq., *Electrician*

WASHINGTON, *February* 3, 1871.

DEAR SIR: It gives me pleasure to be able to state that your electric gas-lighting apparatus, as applied to the lighting of the hall of the House of Representatives, has been in successful operation for over two years, and has not, in a single instance, failed to light all the gas-burners in a few seconds of time, preventing, as heretofore, a bad odor of the escape of gas, and I am happy to recommend your process to the lighting of large halls and public buildings.

O. S. BUXTON,
Doorkeeper House of Representatives.

SAMUEL GARDINER,
Electrician, United States Capitol.

70 UNION PLACE, *September* 1, 1868.

DEAR SIR: I have examined the insulated copper wires which Mr. Gardiner proposes to use in your stores for lighting the gas-jets. In my opinion, they are of sufficient diameter to carry the electric current he intends to employ. They are also well insulated, so that no spark or current can pass through the insulating materials to cause fire; in other words, I consider them perfectly safe and durable.

I am happy to state, also, that nine years ago I first had the pleasure of showing Mr. Gardiner's ingenious invention at a lecture (given for the benefit of the church for the deaf-mutes) in the Academy of Music.

Since that time Mr. Gardiner has been wholly occupied in the business of lighting gas-jets by electricity. I question if any one has as much experience in this matter as himself.

I have the honor to remain your obedient servant,

R. OGDEN DOREMUS.

Mr. A. T. STEWART.

THE NITRO-GLYCERINE COMPANY,
LESSEE OF THE UNITED STATES BLASTING OIL COMPANY'S PATENTS,
Office, Nos. 78 *and* 80 *Broadway, New York, August* 31, 1868.

DEAR SIR: In answer to your questions, I briefly state my opinions, viz: A current of electricity produced by a Voltaic battery cannot escape from the wires (No. 16 insulated) shown me in sufficient quantity to ignite any substance used in the construction of buildings.

The samples of wire shown me, one insulated with gutta-percha and the other whip-covered, are the usual and only kinds used in America as reliable for electric conductors in houses.

I have seen your process for lighting gas by electricity successfully during the last ten years, and I am surprised that there should be a necessity for asking me any questions upon the subject.

Yours, respectfully,

TAL. P. SHAFFNER, *Electrician, &c.*

SAMUEL GARDINER, Esq.

NEW YORK, *February* 9, 1871.

DEAR SIR: In reply to your letter of the 7th instant, I beg to state that some years ago I had my gallery lighted by electricity, (whether by "Wilson's lighter," or some other patent, I do not now recollect,) but found that the apparatus would frequently get out of order from atmospheric causes and changes in the temperature. I have now the gas in my gallery lighted by torches.

Yours, respectfully,

AUG. BELMONT.

D. SMALL, Esq.,
218 *B Street North, Washington, D. C.*

NEW YORK, *February* 3, 1871.

MY DEAR SIR: Mr. Wheeler only received your letter last evening, and to-day he has handed it to me. I have called on Mr. Steinway and inquired as to his use and experience of the Wilson electric spark lighter. He was indisposed to give much information about it, but briefly stated he tried the plan a few years ago and abandoned it, on account of its imperfect working; said the burners were not always reliably lighted. I closed the conversation by asking him if he would like his hall lighted by electricity, if it could be done satisfactorily; when he replied he should. The strongest evidence of the failure of the Wilson plan of lighting, as tried by him, was in this response, that he would like a reliable method introduced. At Booth's theater there seemed to be a disposition to give no information, as I judged there was some law-suit going on, in relation to the Wilson patent and its use at that place. So much as this, however, I learned from the gas-man of the house, that the burners did not always light, and hand-lighting had to be resorted to to some extent. In an interview I had two weeks since with A. T. Stewart, he spoke of your plan of lighting, as now used by him, as entirely

successful, and said he had examined the Wilson plan, but did not approve of it. All concur in one opinion, that the least imperfection in the insulation of the wire used in the Wilson spark process will permit the spark to escape and frustrate the successful lighting.

Yours, truly,

ABNER BARTLETT.

Professor SAMUEL GARDINER, *Washington, D. C.*

Final decision and confirmation of the report of the judges in awarding to Samuel Gardiner the first premiums for the best and most reliable and practicable mode for lighting gas by electricity; an appeal having been made from said decision by A. L. Bogart, proprietor of the Wilson patent, to the board of managers of the American Institute, New York.

[Extract from the report of the judges in Department 6, Group 4, at the fair of the American Institute, held in the city of New York, October, 1869.]

REPORT ON THE WILSON PATENT—BOGART, PROPRIETOR.

No. 436.—"ELECTRIC GAS-LIGHTING APPARATUS."

This consists of a galvanic battery, Ruhmkorff's induction coil, and conducting wires, which are broken near the gas-jets so that an electric spark is produced by a charge of electricity leaping to the "tips" of the burners, each burner being insulated, and forming a part of the circuit. The ends of the wires from which the spark proceeds are covered with platinum to prevent their corrosion.

The use of the spark obtained from electricity of high intensity, induced by "Ruhmkorff's induction coil," is not nor was not novel to this apparatus for lighting gas. It involves the necessity of great exactness in the adjustment of the points of the wires at the gas-jets, and also in the insulation of the wires. When these have once been regulated they are very liable to become disarranged. In cases of rapid currents of air passing over the burner at the moment of the occurrence of the spark, it is obvious, as experiments have proven, that the gas fails to ignite. The peculiarities herein stated are the more prominent, which have led us to regard it as not the best known to us, but as second in class.

REPORT ON SAMUEL GARDINER'S PATENT—FIRST PREMIUM.

No. 963.—"ELECTRIC APPARATUS FOR LIGHTING GAS."

This consists of a galvanic battery, insulated conducting wires leading near the gas-jet, and joined or connected so as to complete the circuit, by small spirals of platinum wire adjusted over and very near the gas-jets of the burners, the tips of which are lava, and a circuit connector and breaker.

By this apparatus a current of dynamic electricity is established, which, in passing over the platinum spirals, heats them to a dull red, and thus ignites the gas.

The lava tips insure insulation of the platinum spirals from the metallic portion of the gas-burners. The form of electricity employed by this apparatus is easily confined to the conductors, so that the adjustment of the insulation is attended by no difficulties. The platinum spirals are placed immediately over the gas jets, insuring ignition, while during the burning of the gas they are within the cooler and deoxidizing part of the flame, which insures their durability for a long time.

This plan possesses more features of invention, is more reliable in action, and less subject to accidents or disarrangement than any other known to us; we, therefore, recommend a first-class premium.

D. D. PARMELEE, M. D.,
JOHN PHIN,
P. H. VAN DERWEYDE, M. D.,
Judges.

I certify the foregoing to be a true copy from the report on file.

JOHN W. CHAMBERS,
Secretary Managers.

[It appeared from a copy of testimony given by T. P. Shaffner, in a case in one of the courts of New York, that he affixed his name to the report printed on pages 15 and 16, while at the Hoosac Tunnel, in Massachusetts; that it was drawn by Mr. Knight; that, although appointed

on the committee by the Commissioner of Public Buildings, he did not meet with them; that he was not in Washington when it was prepared; that he did not know and had never heard of Nicholas Pike; that he never acted with the other persons named in making an examination of Mr. Gardiner's apparatus, but was tolerably familiar with it, as far as he could see from a distance, but did not go through the examination of the platina or the arrangement of the wires; that he signed the report because he wanted to help Mr. Gardiner, deeming him a very meritorious man who ought to be encouraged; that he thought some points of the report were "considerably roseated, a little colored," but that Mr. Gardiner ought, in his opinion, to be paid the money that had been held back on his contract on account of a counter-report against him, signed by Professor Henry, and he wanted to do what he could to get him the money that was due him.]

The following certificates were also filed by the petitioner:

BOSTON THEATER,
Boston, Massachusetts, February 17, 1869.

We take pleasure in certifying that Wilson's Electrical Gas Lighter has been in use at the Boston Theater during the last three years, and has given perfect satisfaction. It has never failed to light the chandelier during the whole time, and continues to work in perfect order. During the whole time it has been in operation it has not required the expenditure of a dollar for repairs. By its use, besides other advantages, it has caused a great saving of time, labor, and gas.

F. O. PRINCE,
President of the Corporation, in behalf of the Directors.
S. B. BOOTH, *Manager.*

BOOTH'S THEATER,
New York, September 14, 1869.

Wilson's Patent Electric Gas-lighting Apparatus, constructed for and applied to the whole number of jets contained in my theater, is worthy of my unqualified commendation. Having had for several years a knowledge of its utility, economy, and certainty in lighting the Boston Theater, I had not the slightest hesitation or misgiving in placing the gas jets in the best position for effectiveness, especially where the torch could not be made available.

From the opening night to the present, it has not failed to perform its office satisfactorily. Having the facility of *instantaneously* lighting the auditorium as well as the border lights of the stage, it enables the perfecting of scenes that could not be otherwise produced. It prevents the escape of gas and consequent fouling of the atmosphere. It is also a great economizer of gas, as the general lighting is done preparatory to the opening of the house, or the borders lighted until a moment before the commencement of the performance, during which, not unfrequently, the greater number of burners in the auditorium may be turned entirely off to advantage, to be relighted by the apparatus the instant they are required. It is under the control and operation of the gas man of the theater, without the aid of an expert. The match and torch are dispensed with; it is therefore estimated as a fire insurance. Its practical convenience is bound sooner or later to insure its universal adoption in public buildings.

EDWIN BOOTH.

PECK'S MUSIC HALL,
New Haven, Connecticut, November 9, 1866.

Wilson's Electric Gas Lighter, which has been in constant use in my hall for the past six years, has during that time given the fullest satisfaction, and, when properly attended to, has never failed to do its work. I regard it as a most perfect and indispensable method of lighting gas, and would on no account do without it. I therefore cheerfully and earnestly recommend its adoption, and feel sure that all who use it will find, as I have done, that it is economical, reliable, safe, and in all respects satisfactory, being far superior to any other known method of igniting gas by means of electricity.

SAMUEL PECK,
Proprietor of Music Hall.

PECK'S MUSIC HALL,
New Haven, March 24, 1870.

MADAM: I now take pleasure in answering your inquiries about cost, &c., of using the Wilson Electric Lighter. Zinc plates have to be renewed once in about three years. Music Hall is used two hundred or more nights per year. Yearly expenses of keeping apparatus in order will not exceed $5.

Any other questions you may wish me to answer will be cheerfully complied with.

Very respectfully, yours,

CLARK PECK,
Agent of Music Hall.

Mrs. J. H. WILSON.

41ST CONGRESS, 3d Session. } HOUSE OF REPRESENTATIVES. { REPORT No. 49.

SENATE CHAMBER AND HALL OF THE HOUSE OF REPRESENTATIVES.

MARCH 3, 1871.—Ordered to be printed and recommitted.

Mr. JENCKES, from the Select Committee on Ventilation, made the following

REPORT.

The Joint Select Committee of the two Houses of Congress appointed at the last session to examine into the present condition of the Senate Chamber and Hall of the House of Representatives as regards lighting, heating, and ventilation, and their acoustic properties, and the defects and disadvantages existing in the same, and the best method of providing remedies therefor, make the following report:

Several committees in previous Congresses have been charged with the same duty as that imposed upon this committee by the joint resolution authorizing their appointment. The reports of these committees contain much useful information, and many theories and speculations concerning the several subjects embraced within the scope of their inquiries. But their investigations, and the elaborate reports which followed them, have led to nothing substantial in the way of improving the condition of the two halls. The evils were felt and admitted, but the plans which were proposed for removing them did not meet the approval of either House. This committee have had the advantage of the labors of all these previous committees, and in conducting their own investigations, and in making experiments to test the accuracy and value of the theories and plans submitted to them, their endeavor has been to arrive at some correct and practical result. Their first effort was to ascertain with as much exactness as possible the existing state of things in the two halls which affected the subjects of their inquiries; then to detect the conditions under which the evils complained of appeared, with a view to the removal of their causes as far as practicable. This mode of conducting their investigations led the committee to the conviction that the magnitude of the evils had been greatly overestimated, and that the problem which had been submitted to this and previous committees was not so difficult of solution when its elements were once discovered and understood.

The remarks which follow will be mainly applicable to the hall of the House of Representatives, as that is much the larger of the two, and the incidents of its use to be inquired into are complicated with much greater difficulties. Whatever is stated about the larger hall may be taken to be true with regard to the smaller, although in a lesser degree, unless otherwise stated.

AS REGARDS THE LIGHTING OF THE HALLS.

The light is received through large plates of glass in the roof, half an inch in thickness, modified and reduced by the stained glass in the ceil-

ing. The supply from other quarters is too limited to be taken into account.

The "defects" in this mode of admitting light are in the too limited space allotted to the glass in the roof, and in the obstruction to the transmission into the hall of that which is thus admitted by the stained glass in the ceiling of the hall. If the light passed freely through this ceiling the area of the glass in the roof would probably be sufficient. But the most translucent parts of this stained glass absorb or keep back at least twenty-five per cent. of the light which strikes their upper surface, and the stained portions, which are more than one-half of the area of the ceiling, intercept at least fifty per cent. (See letter of Professor Henry.)

The "disadvantages" of this mode of lighting the hall are that no clear light is admitted from without at its full illuminating power into any part of the hall; and that in order to relieve the eye from the effect of the direct rays of the sun upon this semi-transparent ceiling it became necessary to use large blinds, or louvers, which, while they shaded the ceiling from the sun, greatly obstructed and diminished the force of the light which passed through the glass in the roof. Besides, the committee found these louvers constructed in sections, disconnected, and only to be adjusted by an attendant who could reach the point from which the sections could be moved by walking along a narrow plank causeway laid across the large iron girders of the ceiling. The consequence was that there was no uniform adjustment of the sections, and that some would be closed too much in cloudy days, when none too much light could be admitted if all of them were wide open. The eyes of those on the floor would be sorely tried in the obscurity. To the changes in the force of the light caused by the clouds were added the variations and uncertainties in the management of these louvers.

This method of lighting the hall was not in the original design of the architect of these buildings. His plan was to have raised the inner walls next to the hall to a height to have admitted windows of sufficient capacity for lighting the hall in all states of the sky and weather. On the northern side of the hall a clear and unobstructed light would have been admitted at all times, while on the other sides blinds would have been adjusted so as to exclude the direct rays of the sun without creating obscurity in the hall below. These windows were designed to be double, so as to have afforded protection against the cold in winter and sudden changes at all seasons. By this arrangement the hall would have received an abundance of cheerful light, sufficient at all times, of easy control under external changes, and grateful to the eyes of those sitting at their desks on the floor.

Former committees have considered the propriety of reconstructing the roof in conformity with the original design of the architect, and have caused estimates to be made of the expense of such reconstruction. This committee have to some extent verified the estimates of the expense, and find it so great that they do not concur in the views of a former joint committee, who recommend the change to the original plan. These estimates at present prices of labor and materials would make the cost of the alterations about $200,000 for each of the two wings. Nor would it be safe to calculate that the work, if undertaken, could be finished between the sessions of Congress.

Some changes have been recommended by the committee and have been made under the direction of the architect of the capitol. One of these was, to connect the louvers or blinds under the sky-light so that all under each slope of the roof could be moved and adjusted at the same time, thus rendering it easy for the attendant to admit the full force of

the light or to prevent the rays of the sun from entering the hall, or otherwise to adjust the blinds so as to equalize the light under all external changes. Another change has been made in removing the plates of iron from the row of panels next to the outer squares of glass in the ceiling of the hall and to insert in their place plates of glass. The illumination of the hall is thus increased to some extent in the day-time, and very greatly in the night by placing a circle of gas-burners above each plate of glass. The effects of this change is perceived with more effect in the galleries than upon the floor. In the night, by gas light, every part of the hall is now thoroughly illuminated.

The expense of these changes has not been great, and has been fully provided for by the appropriation of the last session. The lighting of the hall would be still further improved by taking out the stained glass in the ceiling and replacing it by glass ground upon one surface like that introduced into the outer row of panels. A further improvement in the light could be made by removing the large plates of glass in the roof which are thick and but semi-transparent, and replacing them with lights similar to those in the roof of the old hall and over the Supreme Court room. Glass thus arranged would not only admit more light, but cause it to be diffused more evenly over the ceiling, and relieve the galleries from the shade now cast upon them. But as no complaints have been made of an insufficiency of light since the alterations already described, the committee have not thought it best to recommend an increased expenditure for that purpose. They are satisfied that no great improvement can be made in the method of lighting of the hall unless a complete change is made in the structure of the roof. No alterations have been found necessary in the mode of lighting the chamber of the Senate.

OF THE MODE OF HEATING THE HALL.

Whenever it becomes necessary for the comfort of the occupants of the hall to increase its temperature above that of the external atmosphere, steam is let into the coils of pipe in the aperture through which the air is forced into the hall by means of revolving fans, and it becomes heated to the requisite degree by contact with the pipes containing the steam. The air thus heated is distributed by large conduction pipes to different parts of the floor of the hall, through which it is admitted into the hall by means of registers. Some heated air is also forced into the hall through apertures on its sides, at a short distance above the floor.

Whether this mode of heating has "defects and disadvantages" which render it less economical or effective than other systems, the committee did not stop to inquire, as the cost of removing the present apparatus and substituting a new one constructed on any other principle, or acting through other means, would be greater than the committee would recommend or Congress be willing to expend.

The principal defect in the mode now in use is in the manner in which the heated air is conducted into the hall and distributed by means of pipes, flues, and registers. In the present arrangement of the air shaft, pipes, and registers, the heated air is discharged into the hall more freely from openings near the shaft than from those more distant from the source of supply. The Architect of the Capitol has devised a plan which the committee have recommended, by means of which the heated air will be more evenly distributed in its delivery into the hall, and the space beneath the floor is utilized as a reservoir of heated air. This change will also make a great improvement in the construction and

ing. The supply from other quarters is too limited to be taken into account.

The "defects" in this mode of admitting light are in the too limited space allotted to the glass in the roof, and in the obstruction to the transmission into the hall of that which is thus admitted by the stained glass in the ceiling of the hall. If the light passed freely through this ceiling the area of the glass in the roof would probably be sufficient. But the most translucent parts of this stained glass absorb or keep back at least twenty-five per cent. of the light which strikes their upper surface, and the stained portions, which are more than one-half of the area of the ceiling, intercept at least fifty per cent. (See letter of Professor Henry.)

The "disadvantages" of this mode of lighting the hall are that no clear light is admitted from without at its full illuminating power into any part of the hall; and that in order to relieve the eye from the effect of the direct rays of the sun upon this semi-transparent ceiling it became necessary to use large blinds, or louvers, which, while they shaded the ceiling from the sun, greatly obstructed and diminished the force of the light which passed through the glass in the roof. Besides, the committee found these louvers constructed in sections, disconnected, and only to be adjusted by an attendant who could reach the point from which the sections could be moved by walking along a narrow plank causeway laid across the large iron girders of the ceiling. The consequence was that there was no uniform adjustment of the sections, and that some would be closed too much in cloudy days, when none too much light could be admitted if all of them were wide open. The eyes of those on the floor would be sorely tried in the obscurity. To the changes in the force of the light caused by the clouds were added the variations and uncertainties in the management of these louvers.

This method of lighting the hall was not in the original design of the architect of these buildings. His plan was to have raised the inner walls next to the hall to a height to have admitted windows of sufficient capacity for lighting the hall in all states of the sky and weather. On the northern side of the hall a clear and unobstructed light would have been admitted at all times, while on the other sides blinds would have been adjusted so as to exclude the direct rays of the sun without creating obscurity in the hall below. These windows were designed to be double, so as to have afforded protection against the cold in winter and sudden changes at all seasons. By this arrangement the hall would have received an abundance of cheerful light, sufficient at all times, of easy control under external changes, and grateful to the eyes of those sitting at their desks on the floor.

Former committees have considered the propriety of reconstructing the roof in conformity with the original design of the architect, and have caused estimates to be made of the expense of such reconstruction. This committee have to some extent verified the estimates of the expense, and find it so great that they do not concur in the views of a former joint committee, who recommend the change to the original plan. These estimates at present prices of labor and materials would make the cost of the alterations about $200,000 for each of the two wings. Nor would it be safe to calculate that the work, if undertaken, could be finished between the sessions of Congress.

Some changes have been recommended by the committee and have been made under the direction of the architect of the capitol. One of these was, to connect the louvers or blinds under the sky-light so that all under each slope of the roof could be moved and adjusted at the same time, thus rendering it easy for the attendant to admit the full force of

the light or to prevent the rays of the sun from entering the hall, or otherwise to adjust the blinds so as to equalize the light under all external changes. Another change has been made in removing the plates of iron from the row of panels next to the outer squares of glass in the ceiling of the hall and to insert in their place plates of glass. The illumination of the hall is thus increased to some extent in the day-time, and very greatly in the night by placing a circle of gas-burners above each plate of glass. The effects of this change is perceived with more effect in the galleries than upon the floor. In the night, by gas light, every part of the hall is now thoroughly illuminated.

The expense of these changes has not been great, and has been fully provided for by the appropriation of the last session. The lighting of the hall would be still further improved by taking out the stained glass in the ceiling and replacing it by glass ground upon one surface like that introduced into the outer row of panels. A further improvement in the light could be made by removing the large plates of glass in the roof which are thick and but semi-transparent, and replacing them with lights similar to those in the roof of the old hall and over the Supreme Court room. Glass thus arranged would not only admit more light, but cause it to be diffused more evenly over the ceiling, and relieve the galleries from the shade now cast upon them. But as no complaints have been made of an insufficiency of light since the alterations already described, the committee have not thought it best to recommend an increased expenditure for that purpose. They are satisfied that no great improvement can be made in the method of lighting of the hall unless a complete change is made in the structure of the roof. No alterations have been found necessary in the mode of lighting the chamber of the Senate.

OF THE MODE OF HEATING THE HALL.

Whenever it becomes necessary for the comfort of the occupants of the hall to increase its temperature above that of the external atmosphere, steam is let into the coils of pipe in the aperture through which the air is forced into the hall by means of revolving fans, and it becomes heated to the requisite degree by contact with the pipes containing the steam. The air thus heated is distributed by large conduction pipes to different parts of the floor of the hall, through which it is admitted into the hall by means of registers. Some heated air is also forced into the hall through apertures on its sides, at a short distance above the floor.

Whether this mode of heating has "defects and disadvantages" which render it less economical or effective than other systems, the committee did not stop to inquire, as the cost of removing the present apparatus and substituting a new one constructed on any other principle, or acting through other means, would be greater than the committee would recommend or Congress be willing to expend.

The principal defect in the mode now in use is in the manner in which the heated air is conducted into the hall and distributed by means of pipes, flues, and registers. In the present arrangement of the air shaft, pipes, and registers, the heated air is discharged into the hall more freely from openings near the shaft than from those more distant from the source of supply. The Architect of the Capitol has devised a plan which the committee have recommended, by means of which the heated air will be more evenly distributed in its delivery into the hall, and the space beneath the floor is utilized as a reservoir of heated air. This change will also make a great improvement in the construction and

appearance of the floor itself. Substantially the same improvements have heretofore been made in the floor of the Senate chamber, and in the location of the pipes, flues, and registers under and through it.

The greatest obstacle to the preservation of a uniform temperature in the hall was found in the very defective construction of the roof. Taken as a whole, this was little better than an awning spread over the iron rafters. The original plan of this part of the structure having been abandoned, the substitute for it seems to have been adopted without regard to its fitness or permanence, and to have been allowed to remain practically unfinished. The area of that portion directly over the hall is about 13,000 square feet, and of the whole roof, upward of 17,000 feet. Of this area, the plates of glass occupy about 4,000 square feet, in a long parallelogram, divided into equal parts lengthwise by the ridge of the roof. The remaining portion is constructed of sheets of copper three-sixteenths of an inch in thickness, corrugated and fitting loosely together at the joints. The expansion and contraction of this great area of metal has loosened the connection of the plates and opened fissures of considerable width for nearly the whole slope of the roof. The extent of the overlapping of the sheets has prevented leakage during rains, but streams of cold air have free admission. The effect of this condition of the roof has been to cause, in cold weather, the currents of warm air which rise up to it through the ceiling of the hall to become suddenly chilled, and, instead of escaping through the apertures in the roof designed for ventilation, to descend rapidly in a cold shower so as to form in the outer portions of the hall currents which were felt in their downward flow even to the floor. This was the origin of those peculiar chills which would cause members to look up to see if the doors between the galleries and the corridors had not been left open, or to look around and inquire for the apertures through which such a volume of cold air could be so suddenly admitted. These chills were the fruitful source of colds, rheumatic pains, and other serious diseases. Hardly any one escaped their effects. In a cold day in winter, when the temperature kept with difficulty at a comfortable equilibrium by working the heating apparatus so as to counterbalance the refrigerating effects of the roof, the sudden diminution or entire shutting off of the steam in the coils, or even the departure of a considerable number of spectators from the galleries, would diminish the supply of heat and cause the refrigeration to obtain the mastery, to the great discomfort of those who sat beneath the descending currents of the chilled atmosphere. Almost every one has observed this, and many have received injurious effects from it. The reports of previous committees, and of the Architect of the Capitol, had failed to excite sufficient attention to this serious defect in the roof to lead to the making of a sufficient appropriation to provide a remedy for it. As soon as this committee had entered upon its work they became satisfied that this evil should be remedied, if nothing else was done, and upon their recommendation a sufficient sum was appropriated during the last session to provide a substantial fire-proof ceiling immediately below and a few inches distant from the copper roof. The effect of this has been even greater than your committee anticipated. The sudden chills from the cause described have not been felt during the present session, although there has been more severe cold weather and more sudden and extensive changes than for several previous seasons, and the hall has been kept at a comfortable and equable temperature with less use and management of the heating apparatus than before. After the members have taken their seats until the time of adjournment, from about half-past

12 till about half-past 4, the thermometers in the hall have rarely indicated changes of three degrees. The temperature in all parts of the hall occupied for seats has been nearly the same, seldom varying more than a fraction of a degree. On several days when the temperature of the external atmosphere has been upward of 55°, the steam has been shut off from the coils after the session of the House has commenced, and on some such days the temperature in the hall has been the highest of any days during the session. The attendant engineers have rarely allowed the temperature to reach 70° while the heat was dependent upon the supply from this apparatus, but on the days like those referred to, when the steam was shut off, and the supply of heat was not within their control, the thermometers have indicated as high as 71° or 72°. The temperature of the hall during the hours of the sessions of the House has generally been from 66° to 69°, and without any sudden variations.

Some increase of the heating apparatus has been made by introducing grates and coal fires in the cloak rooms. These have been found to be a great convenience and comfort, but their effect has been more decidedly marked upon the ventilation.

The committee recommend the extension of the ceiling of plaster beneath the whole of the copper roof. The air chamber formed between the copper and the plastering is of sufficient dimensions to conduct the currents of cold air which are formed in winter by contact with the copper, as before described, down to the scuppers under the eaves, through which they are discharged without entering the hall; and the currents of hot air formed by such contact in summer are carried up toward the orifices near the ridge of the roof, through which they escape in like manner. The body of air in the chambers forms of itself a shield against both the external cold of winter and the heat from the rays of the sun in summer, and thus aids in preserving the equilibrium of the temperature in the hall.

OF THE VENTILATION OF THE HALL.

The principle upon which all the contrivances for the ventilation of the halls were constructed, and the apparatus fitted and operated, was that of renewing the air which had become foul by respiration and exhalation, by forcing in a continuous supply of fresh air from the external atmosphere by artificial means. It was believed that the air in the hall would be heated while it was being contaminated, and would rise and flow out of apertures in the roof while its place was being supplied by the pure air from beneath. Thus apertures of the area of about 250 square feet were left in the roof for the escape of the foul, heated air as it would ascend from the hall, and a foul-air flue of 25 square feet area, leading downward from the space above the ceiling, was also provided for the drawing off of such foul air either by a connection with the flue of the chimney or by other artificial means. The supply of fresh air was provided for by an air duct leading into each hall, in which was placed a fan operated by a steam-engine, which could create a current sufficient to cause from 50,000 to 100,000 cubic feet of air to flow into the hall every minute. In actual use the supply to the hall of the House is about 60,000 cubic feet each minute, and about half that amount in the Senate. If the air were simply heated in its passage through the hall, or if the heat which it acquired would be sufficient to cause it to rise in one continuous flow, notwithstanding the contamination it receives from various sources at the same time, then the theory would have been

perfectly correct, and the hall of the House would have been the best-ventilated room in the world. The contents of the hall would have been discharged and the hall refilled with pure air once in about seven and a half minutes, without any currents that would have been perceptible and without causing any sensations either of undue dryness, warmth, or chilliness. Indeed, in the ordinary use of the hall in the seasons of winter and spring, when the temperature of the external atmosphere is not above 75° or below 45°, and the hall is occupied only by the members in attendance and the officers of the House, with few spectators in the gallery, there is probably no hall approaching its size in the world which has equally good ventilation. But the designers of this plan of ventilation left out of consideration many of the disturbing elements which make their appearance in the hall in the course of its use, and did not make sufficient allowance for the strength of the resistance of those obstacles which they knew they must meet and overcome. The hall, with from three to five hundred persons upon the floor and in the cloak rooms and from fifteen to twenty-five hundred persons in the galleries and upper corridors presents a very different and far more difficult problem for the science of ventilation than under the conditions first referred to. And when we remember that this extreme occupation may take place in all conditions of the temperature of the external atmosphere, from near zero to upward of 90° ; when the air is surcharged with moisture, as well as when it is dry, bracing and electric; when the weather is cloudy, close, and oppressive, as well as when it is clear; when it is calm, as well as when it is windy; in the night, when all the gas-burners are lighted, as well as in the day time, we see that the problem of successful ventilation is complicated with elements not within the scope of the simple plan at first adopted. Hence we are not surprised at finding so many conflicting statements and conclusions in the reports of former committees and of consulting engineers, and at the variety and even oddity of some of the propositions submitted to the committee for the remedy of the actual and imaginary difficulties which exist or were supposed to exist under the present system.

The committee first endeavored to ascertain the existing "defects and disadvantages" in the contrivances for ventilation, before considering any proposition for relief. By so doing, they found, or believed that they found, remedies for most of the more serious evils, without condemning entirely the present system, or recommending any of the new theories urged upon their consideration.

One of the defects in the original plan, and perhaps the most serious one of all, was the theory that the air in the hall which had become foul by respiration and exhalation would rise and flow off in a regular or gradually accelerated current, and that its place would be as regularly supplied from beneath by the pure air forced in by the fans. If the hall had been very long and very narrow, and the fresh air had been forced in at or near one of the ends, or if the area of the floor had been small and the hall had been very high, an approximation to such a result might have been reasonably anticipated. But the hall is nearly four and a half times as long, and three times as broad as it is high, and the fresh air is not all admitted at one place, or on one line across the floor, or at a great number of points arranged regularly throughout the whole area of the floor, so as to apply a continuous force toward ejecting the foul air; but the registers are scattered about the hall widely distant from each other, or are coincident with the sides of the hall. Nor were the apertures in the ceiling or in the roof so situated as to favor the operation of this theory of a continuous flow. Those in the roof were

near the ridge, those in the ceiling were in the outermost row of squares, while the glass ceiling and the surrounding row of squares with iron panels were entirely closed to the passage of air in either direction. The currents of air that escaped through the apertures of the roof were brought in direct contact with the copper.

The greater portion of the seats are directly under the glass in the ceiling.

The copper roof would in cloudy weather and in the night be of about the same temperature as the external air, and if that was below 70°, the usual temperature of the hall, the upward current would be chilled and consequently checked on coming in contact with it, and when cooled would form a downward current, which would seek ingress into the hall through some of these side apertures in the ceiling. Hence arose the phenomenon which has been remarked upon by all former committees and observers, that in cold weather while an upward current could be detected on one side or at one end of the hall in front of the galleries, a downward current would also be manifest on the other. These currents have been at times so strong as to show a difference in temperature of 5° at the same level on opposite sides of the Senate chamber. The foul air which ascended from the occupied portion of the hall to the glass ceiling would also be checked in its flow, and either descend or remain nearly stationary immediately under that portion of the ceiling, and above and around members in their seats. Thus a body of foul air would be formed in the center of the hall, which, under the conditions described, would increase in offensiveness as long as these conditions continued. The effect of this was graphically described by a chairman of a former committee (Mr. COVODE) in a short speech, when the subject of ventilation was brought before the House by this committee, and is set out more in detail in a report made by him from his committee. (H. R. Report No. 65, Fortieth Congress second session). When the air in this central part of the hall once becomes foul, the pure air injected through the registers does not mingle readily with it, or displace it, but passes around it near the sides of the hall to the openings in the ceiling, or through it in ascending streams, mixing with it but slightly. Every one has observed how long streams of pure and muddy water will keep distinct after uniting and flowing in a single channel. When the bottom of a spring is disturbed and a portion of the water is discolored by the mud, the pure water that arises from the sources does not mix at once with the muddy water, or push it through the outlet, but flows under and around it and runs off freely by itself, and often the clear water, to the amount of many times the contents of the spring, thus runs off, before the whole of the muddy water is displaced. There are some lakes which are traversed by rivers whose streams pass entirely through the body of the lake without mingling with its waters, and whose channels are nearly as marked and distinct from the water they pass through at the place of exit as at the place of entrance. So the foul atmosphere in the hall is like the muddy water in the spring, or the sluggish water of the lake, except that the cause of the disturbance is continuing and increasing all the time, and the fresh air from the registers is like the pure water from its sources, struggling constantly with the foul, and escaping by evading it altogether, or carrying it off by little and little. A delicate anemometer plainly discloses these different currents in different parts of the hall, and in some places very near to each other.

The great fact has been patent to every one who has spent any considerable time in the hall, that the body of 60,000 cubic feet of pure air, which is forced into the hall every minute, ascends and escapes

without carrying with it any considerable portion of the carbonic acid gas and other impurities with which the hall is constantly being filled.

The location of the registers causes another serious defect in the ventilation. The principal of these are horizontal, in some cases extending across an entire passage way, and otherwise scattered around between the desks and under the feet of members. They unavoidably become the receptacles of dirt and scraps, and at the close of each daily session, when the fans are stopped and the current of air caused by them ceases, and the sweeping of the carpets commences, they receive a considerable portion of the dirt that is swept over and around them. This dust, when the fans are again started, is driven out into the hall, and sometimes is so dense as to become visible. This causes the irritation of the throat, and the coughings which are heard so frequently in the hall, and which afflict many who are not subject to colds.

Another defect exists in the absence of means to furnish moisture to the air in cold weather. This defect your committee believe to have been very much exaggerated in previous reports, but it is a serious one during the season of very cold weather. For all that period during which the air is driven into the halls without being heated, or being heated but slightly, there is very little difference between the relative humidity of the air within and without the halls. But when the temperature of the external atmosphere is 40°, and below, and is raised in its passage into the halls to between 65° and 70°, the difference of moisture in the heated air becomes apparent, and produces disagreeable effects. The air rapidly supplies itself with a portion of the moisture which it is capable of holding at the increased temperature from the respirations and exhalations, and having been thus loaded with impurities it becomes the more difficult to be purified or displaced by the fresh dry air which follows, as already explained.

There are also some disturbing elements which occasionally derange the existing plan of ventilation, and which are not met or provided for by any of the contrivances now in use. One of these is the effect of the sun's rays upon the metal in the roof. The whole of this structure above the walls, except those portions occupied by the glass plates, is of copper and iron, and those portions which are below the roof, including the large iron beams, are often heated to a very high degree in the hot, clear days of summer. The thermometer has not unfrequently, on such days, when placed in the space above the ceiling and below the roof, indicated a temperature above 140°. This increase of heat above the ceiling ought to improve the ventilation of the hall on such days, and usually does, except when the unequal currents already explained are set in motion, and in such case it is no unusual thing for this heated atmosphere to be drawn down upon one side or the other of the hall, to the great discomfort of those whom it strikes. The same thing occurs when the gas has been burning for some length of time. The discomfort in this case is much greater, as the heated air which is drawn down is charged with carbonic acid gas, the product of combustion.

Another disturbing element is the great variation in the number of persons occupying the floor and the galleries; each one adds to the carbonic acid by his respiration, and to the general discomfort by increased heat and exhalations. The apertures in the roof are large enough, when the fans are in operation, to meet the wants of fifteen hundred people within the walls of the hall, but there is no adequate provision for the necessities of a greater number. The consequence is that when the galleries are well filled the discomfort must increase until a large portion of the spectators leave.

The cloak rooms have also been an obstruction to healthy ventilation. Being kept closed externally, and resorted to by smokers, the air in them became close and saturated with tobacco smoke, which had no place of escape except into the hall.

Some remedies have been applied and others are now recommended, which, it is believed, will partially overcome these defects. There are defects in construction which cannot altogether be overcome without remodeling the whole structure. The committee have not seen their way clear to recommend the adoption of any new plan of ventilation which is based upon entirely different theories, and which would be revolutionary in its effect upon the building. The vast expense has been one reason, and generally a conclusive one, against such a change. Besides that, most of the plans which have been submitted upon new theories have not been tried at all, or tried upon so small a scale that it seemed to the committee by no means certain that they would be successful when applied to halls of such magnitude as these. In one respect these halls are situated favorably both for maintaining an equable temperature and a healthy ventilation. It is supposed by many that the inclosure of one building within another, the inner one being the hall, is a serious defect in the construction with a view to both these requisites; on the contrary, it is a great advantage. If the hall approached the exterior wall it would be subject not only to all the internal changes of temperature and elements disturbing the ventilation, but also to all those of the external atmosphere and the weather. Almost every one of the disturbing elements that have been named would be greatly aggravated if the hall approached the exterior. It would also be subject to the disagreeable effect of cross-lights and the dazzling effect of the direct action of the sunlight. External influences, like those of noises, winds, and storms, would make themselves felt disagreeably, which are now altogether excluded.

Conceding the advantages of the general structure, and finding that the disadvantage of a forced ventilation could not be altogether overcome, it seemed possible to remove altogether, or to neutralize, some of the existing evils. The first and most serious of these was found in the theory of the forced ventilation, upon which all the apparatus was constructed and arranged. Being dependent for success upon the production of a continuous current in the whole body of the air in the hall from the place of supply to that of discharge, anything which obstructs that current, or prevents the equal discharge, the supply being constant, will impair its efficiency and tend to render it practically useless. What would seem to be the most obvious theory of ventilation, as applied to large halls, was almost entirely ignored in the structure of these buildings. As the foul air is wholly generated within the hall, it might be assumed, as the first requisite of healthy ventilation, that this foul air should be removed. This is the only purpose for which artificial power is needed, as the pressure of the atmosphere is at all times sufficient of itself to force in the fresh external air to fill the space from which the foul air has been withdrawn. It had been suggested by former committees, and the experts whom they consulted, that the fans might be reversed, and be used for exhausting the air from the halls, but no action had been taken upon the suggestion. A step had been taken by the architect in the right direction in 1866, when, as he says in his report for that year, he "found" a large flue in each wing of the Capitol, "running from the cellar and emptying into the loft of the connecting corridors," which he caused to be connected with the smoke flues from the boiler furnaces. How the knowledge of these flues became "lost," subsequent to the completion of the wings, is not

explained. This flue in the House wing has an area of 25 square feet, and withdraws the air from the loft above the ceiling, in quantities depending upon the strength of the draught in the chimneys. It has done good service, but its capacity is not equal to the duty required of it. In the flue in the Senate wing a fan has been placed to operate upon the air above the ceiling by exhaustion, and the effect is so excellent that the committee recommend a similar fan to be operated in the flue upon the House side. They recommend also that this flue be enlarged to double its capacity, which the architect reports can be done without injury to the building, by chipping out one foot in thickness from the surrounding walls, which are now three feet in thickness. An additional engine will be needed to operate this fan. When completed and in operation this fan can discharge 50,000 cubic feet per minute from the loft over the ceiling of the hall, and when both the forcing-in fan and the exhausting fan are in operation the atmosphere in the hall can be changed every five minutes. This would insure a perfect ventilation, if it were certain that only the foul air would be discharged. In order to insure this result the apertures leading from the hall to the loft have been greatly enlarged and distributed over the greater portion of the ceiling. This has been done both in the Senate chamber and in the hall of the House, by simply lifting the iron sash which holds the glass from its seat, thus permitting the air to flow freely through apertures two inches in width, all around each of the squares. The area of the apertures in the outer row of squares is 70 square feet, to which have been added 200 square feet by raising the sashes, making a total of 270 square feet, through which the foul air can be withdrawn from the hall through this flue and through the apertures in the roof.

In order that the supply of fresh air may be delivered in the manner that will insure its most thorough distribution, it is proposed to reconstruct the floor and make a new arrangement of the flues and hot-air pipes under it, so that the air may enter the hall from vertical registers in front of the steps, in all parts of the hall. The nuisance of dust will also be avoided by this arrangement. The plan has been tried in the Senate chamber with complete success.

For the more thorough ventilation of the cloak rooms, chimneys have been chiseled out of the interior walls of the building, and fitted with grates for burning anthracite coal. Tubes, with bell-shaped mouths, have been placed over the gas-burners, and openings have been made from the library and other small rooms into the vestibules. These improvements make the ventilation of the cloak rooms and other small rooms adjoining the hall practically perfect.

The chimneys above the cloak rooms are made to do a double duty. The flue for the products of the combustion of the coal occupies the middle of the chimney, while a flue on each side of it opens at its lower end into the open space beneath the floor of the gallery and above the roof of the cloak rooms. These flues withdraw the air from the galleries and the hall through these spaces, which thus become exhaust-chambers instead of hot-air ducts, as formerly. The effect of these flues upon the air in the galleries is very beneficial. It is recommended that the same improvements be made in the Senate chamber.

The heat from the gas-burners above the ceiling is also a disturbing element in the ventilation of the hall. The temperature of the air in the loft is raised by the heat of the burning gas from 30° to 50° above the temperature of the hall. It is believed that this disturbing element can in a great measure be removed or controlled by the operation of the fan for exhaustion. It is proposed, however, to place tubes and flues

above the burners so as to carry off the heat and the products of combustion in the same manner that they are removed from the cloak rooms. This method, it is expected, will greatly improve the ventilation.

Contrary to the general belief, it has been found, by repeated experiments, that the gas while burning does not increase the temperature in the hall. Thermometers placed immediately under the ceiling and exposed to the full effect of the light, indicated a temperature but 2° higher than that shown by thermometers placed at the height of the desks on the floor, and no higher than that indicated by thermometers at the same level under the shaded portions of the ceiling. Many members have kept on their hats, or used some sort of a shade for the head, to protect it from the heat supposed to be radiated from the burning gas during the night sessions; but it has been demonstrated that whatever discomfort is caused by the burning gas, it is not owing to its radiation of heat. The stained glass of the ceiling intercepts from 25 to 50 per cent. of the light from these burners and all of the heat.

OF THE PLANS SUBMITTED TO THE COMMITTEE.

In response to the invitations of the committe, many plans for the improvement of the ventilation of the halls have been submitted by different parties, some of which deserve and have received a careful consideration.

The most important of these is the plan and proposition of Laban C. Stimers, an engineer of New York. His plan was submitted to a former select committee of the House on the subject, and the proposition now submitted is in further explanation of his proposed improvement.

If a new Capitol were to be built, so that the system proposed by Mr. Stimers might be completely provided for and developed in every part of the structure from the foundation to the roof, his plan might receive favorable consideration from those who had in charge the erection of the new building. But the magnitude of the work, as well as the great expense it would involve, and the length of time required for its completion, have deterred the committee from recommending its application to the existing structure. It is a proposition which in its application to the Capitol as it now is, would be revolutionary in all that relates to the modes of heating and ventilation, and the adoption of which could only be justified by the total failure of the present method and apparatus. His essays form a valuable contribution to the science of ventilation. They will be found appended to this report. His plan requires the erection of structures outside of the Capitol, at a cost, as estimated by the Architect, of upwards of $300,000; and he proposes to furnish the necessary machinery and apparatus, and make the requisite alterations in the Capitol itself, at a contract price of $654,000. The committee became satisfied that the lowest estimate which could be placed upon the cost of the introduction of Mr. Stimers's system of ventilation into both wings of the Capitol would be about $1,100,000.

Another plan is that proposed by Mr. Luther Robinson, of Boston. He expects to accomplish successful ventilation by a number of peculiarly-constructed ventilators in the roof. There are serious objections to the use of such ventilators in connection with the present apparatus for forcing air into the hall, and without altering the structure of the roof and ceiling; and the committee have hesitated to recommend the adoption of Mr. Robinson's plan as a whole. They have, however, come to the conclusion that ventilators in the roof may be of some service in summer, especially over the staircases and corridors, and perhaps

over the hall, if they are made so as to be capable of constant regulation and adjustment. The selection and application of them the committee propose to leave to the judgment of the Architect of the Capitol, guided by experiments to be made after the exhausting apparatus shall have been introduced and tested.

The committee have thought it best to append to this report all the propositions which they have received upon the several subjects referred to them, and also to reprint those portions of previous reports which give the history of the ventilating of the halls. The valuable report of Dr. Charles M. Wetherell, with those of Mr. Walter, the former Architect of the Capitol Extension, and of Professor Henry, of the Smithsonian Institution, on the same subject, are also appended, the original editions having been exhausted. Some observations are added by way of notes which have been suggested by the experiments made under the direction of the committee.

Among the propositions is one from the United States Ice and Refrigerating Company, for the erection and fitting up of refrigerating machines for the purpose of cooling the halls and corridors in summer. Your commmittee are of opinion that an apparatus of this kind for the purpose of cooling the walls of the corridors in the early part of the day in summer, before the hour for committee meetings, would prevent the excessive heat from without from penetrating into the hall, and give a grateful coolness to the air which entered through the wire-gauze doors. A jet of air of a temperature reduced by this apparatus, thrown into the flue through which the external air is forced into the hall, might reduce the temperature from 4° to 5° below what it would otherwise be. On referring the proposition to the Architect he reported that it was not practicable to erect the structures necessary to prevent the escape of the cold air to be used for refrigerating the corridors without disfiguring and obstructing the entrances to the hall and the corridors, and that the other method of utilizing the cold air would require greater alterations in the flues and ventilating apparatus than he thought proper to recommend. These objections, with that arising from the great expense of the apparatus, considering the very short period in summer when it is actually needed, were sufficient, in the judgment of the committee, for not entertaining the proposition. The best method of making an application of this refrigerating process to the necessities of the halls has probably not yet been suggested.

Henry A. Gouge also exhibited his apparatus for ventilation before the committee, and explained its operation and use. It will be found in the appendix. The committee had doubts of its efficiency in so large a structure. It seems well fitted for the cloak rooms and committee rooms. Under the appropriations already made the Architect will be at liberty to test its value in such manner as he may think fit.

Some of these propositions will strike the reader as very singular, and based upon curious ideas concerning the principles of ventilation. But they have all been submitted to the committee in good faith, and as some of them were prepared by parties who had not made themselves familiar with the structure of the halls and the changing circumstances attending their daily use, any apparent eccentricities may be more properly charged to the want of information upon these facts than to ignorance of natural science. It must be remembered that the science of ventilation itself is of very modern date, hardly older than the use of anthracite coal as a fuel, and that its successful application to the hall of the House of Representatives is probably the most perplexing and complicated problem of the kind ever submitted to an engineer.

OF THE MANAGEMENT OF THE HEATING AND VENTILATING APPARATUS.

The series of improvements which will close for the present with those recommended by this committee, will probably furnish the means of adding to the comfort of members while engaged in the hall; but this will by no means remove all the defects in the methods of heating, lighting, and ventilating the halls, as some of these are inherent in the structure itself, and cannot be overcome except by changes which would be essentially revolutionary and enormously expensive. It was said in the House of Commons in England that two hundred thousand pounds sterling had been expended in endeavoring to improve the ventilation of the two houses of Parliament, and that they were little better in this respect than at first. We might expend a like sum in experiments upon theories that seem plausible, but which have never been tested upon a large scale, with a similar result. We may admit that our structures are faulty, and that our apparatus is arranged and operated upon a false principle, but it does not follow that they must be renovated and reconstructed altogether in order to avoid the evil consequences of these errors and defects. Some of the consequences may be averted by comparatively slight changes in the structure and apparatus, and others may be prevented in part, if not altogether, by the watchfulness of attendants. However perfect the theory and correct the principle upon which a system of ventilation on so large a scale as that required in these halls may be set in operation, it will never be entirely satisfactory at all times, unless it is made to adapt itself to the changing conditions and circumstances which attend its use. There are no known contrivances by which it can be made wholly automatic, and there are no well-known and well-settled rules by which the proportion of cause to effect can be determined absolutely in the several elements of which such a system must be composed. Our efforts are at most a series of experiments; a tentative process, out of which perfect symmetry of arrangement in detail of construction and mode of operation may at last be attainable, but which as yet has not been attained.

Many of the inconveniences heretofore experienced have arisen from the ignorance or inattention of those who have been employed as attendants upon the halls. It has not been their fault altogether that they were, when appointed, ignorant of the duties which they ought to perform, or that they have remained uninstructed. Some of them are appointed by the Clerk of the House, some by the Doorkeeper; some are in the employment of the Superintendent of Public Buildings and Grounds, and some of the Architect of the Capitol. There is no good reason why these persons should belong to essentially different corps, but every reason why they should be appointed by, and be under the control of one who can select his employés with regard to their fitness for the duties they have to perform, and who has the skill to teach them what their duties are, and to see that those duties are always well performed. There is not an office connected with the heating, lighting, and ventilation of the halls which does not require a good education and a considerable degree of skill in the performance of its duties. While the House is in session of a cloudy and windy day, it requires the constant attention of one person to adjust the louvers at every change from fair to cloudy, and from clouds of one degree of density to those of another, so that the hall may receive a sufficient degree of light all the time, not seriously affected by the external fluctuations. It requires a greater degree of attention, a better education, and a higher degree of skill in the per-

son who observes the hygrometer and the wet and dry bulb thermometer, to ascertain the relative humidity of the atmosphere, and to know what amount of additional moisture it requires to bring the air in the hall up to the healthy degree of saturation, and to know when and by what means the want should be supplied, and to be able to have it supplied without causing the infusion of an excess of such moisture. Dr. Wetherill says, (p. 80,) that "to add water, whether in winter or summer, requires *intelligent and watchful industry*, aided by a proper psychrometer." This latter instrument is to be found, he adds, in the improved hygrometer. And when the ordinary hygrometric conditions of the atmosphere in the hall are reversed, and there is an excess of moisture, and on the days when the action of all the natural forces is sluggish or inverted, when coal will not burn in the grates, and the chimneys fail to draw, and the air is forced back or falls back in the flues and outlets, notwithstanding all the force of the fans is applied to urge it forward, the highest degree of skill is required to keep the system in action, and to prevent discomfort. So also, it needs constant watchfulness and observation of thermometers, as well as care in adjusting and regulating the supply of steam to the coil of pipes in winter, to keep the temperature of the hall at the proper degree for comfort and health. In summer the same attendant must be constantly using his judgment with regard to the opening and closing of the external doors and windows, in order to help out the artificial with some natural ventilation. If the skill, watchfulness, and activity of these attendants were of the highest degree that could be obtained, then, even with the present system, any positive degree of discomfort could be prevented at all times. With such as can now be obtained, there is no reason why, under a single head and proper management, the healthful and comfortable condition of the hall should not be preserved during the hours that the House remains in session. The committee therefore recommend that all the persons who are employed for the purpose of attending to the heating, lighting, or ventilating of the Capitol be under the direction, control, and supervision of the Architect of the Capitol.

The committee have not obtained any information which enables them to recommend any change which would improve the acoustic properties of the hall. Its "defects and disadvantages," in this respect, are both in design and in construction, and cannot be remedied by any slight alterations. But the committee are of opinion these are of not so much consequence as is generally supposed. It is rather the magnitude of the hall than any peculiarities in its construction which renders it difficult to catch every word uttered by a member speaking from the floor.

OF THE DIFFERENT THEORIES.

The committee have not attempted to decide between the two theories of upward and downward ventilation upon which the engineers divide, and argue earnestly for and against the merits of each. All the arrangements in the hall as constructed are for the use of upward ventilation, and those who have recommended the substitution of downward ventilation have presented no plan of alterations which did not require a very large expenditure of money to introduce, wholly disproportionate to the value of the supposed advantages from its introduction. But the changes and additions recommended by the committee are such that it will be easy hereafter to adopt a downward ventilation if the modifications of the present system fail to produce adequate results. A downward ventilation may to some extent improve the acoustic qualities of the hall,

but it is not believed that such a change will be called for, or, if adopted, that it will be found beneficial.

COST.

The cost of all the alterations heretofore made upon the recommendation of the Committee on the Hall of the House has been about $16,000; of those to be made, including a new fan and steam-engine to operate it, is estimated to be $20,000.

PROPOSITIONS.

The various plans, propositions, and estimates received by the committee from various parties are hereto appended.

APPENDIX.

REPORT OF H. F. HAYDEN, CHIEF ENGINEER OF HEATING AND VENTILATING DEPARTMENT, UNITED STATES SENATE.

HEATING AND VENTILATING DEPARTMENT U. S. SENATE,
May 10, 1870.

SIR: I have the honor to submit the following report relating to the heating and ventilating department under my charge, showing its condition when I first assumed charge of the same, and the improvements that have been made during the past year. I found that there were two serious defects, which had always existed in the ventilation of the Senate wing:

1st. That one of the most manifest and material defects had been the want of proper moisture in the supply of heated air. It must be apparent to those who have given their attention to the subject of ventilation that the only way that heated atmosphere can be made healthful and pleasant to the senses is by a careful process of artificial evaporation. In view of this fact I have endeavored to obviate this difficulty, which I will explain more fully hereafter.

2d. That there was no escape whatever for the vitiated air in the chamber. Two avenues of escape had been constructed by the Architect of the Capitol Extension, but were closed off by the engineer in charge at that time. The air was forced by a fan into the chamber and allowed to take its own course, subject to all the disturbing causes which must necessarily exist in a hall which was without any escape for vitiated air. Therefore the air in the chamber would soon become so impure, and the ventilation so imperfect, that the necessity would be clearly shown of having that method of ventilation changed, so that the supply of heated air could be moistened and made pure and heathful, and the vitiated air removed in order that the same air could not be breathed twice. Dr. Antisell, in his interesting and able report on ventilation of the Senate wing, July 18, 1866, page 4, says:

"Ventilation has for its end and aim the removal of the vitiated air of dwellings and other crowded places, whenever and as fast as it is produced; but it is not possible by ordinary means to remove the vitiated air without its place being filled by air from another quarter, and thus the exit of air and its rëentry appear to be indissolubly linked, yet they ought not to be viewed in too close connection or as of equal importance. The first condition, the extraction of air, is of prime importance. The air which has been used is a poison, and the chief and first step to be taken is to remove it. In doing this one-half of the second condition has been obtained; that is to say, an equal supply of air has been introduced. What remains to be fulfilled of that second condition is to be certain that the new air is both healthful and agreeable to the feelings."

Upon an examination of the main air duct leading from the fan to the Senate Chamber, I found that the apparatus used by Dr. Antisell in conducting a course of experiments on hydration remained as left by him. It was, however, inadequate, as the relative humidity could only be kept at 30°, which was below the healthy minimum. I therefore had the apparatus removed, and have introduced a vaporizing apparatus in the main air duct, so that warm water can be vaporized and diffused in the supply of heated air, rendering it pure and healthful, and the relative humidity in the Senate chamber can be kept at 60° during the winter season.

In using water for the purpose of hydration, great care and attention should be paid to the hygrometric condition of the atmosphere. This can be ascertained at all times by the use of "hygrodeiks," which give the dew point and relative humidity. During

the last session of the Fortieth Congress, and the first session of the Forty-first Congress, while employed as assistant engineer in the heating and ventilating department of the House of Representatives, I began using the "evaporator," situated in the main air-duct leading to the Representatives' Hall, and, by careful application, commencing at 8 a. m. and continuing it until the hall was heated up to the usual temperature of 69°, I soon discovered that the ventilation of the hall was greatly improved, and I am fully convinced that it was due to hydration, as the evaporator had not been in use for several years. In a report made by Charles M. Wetherell during the Thirty-ninth Congress, first session, on warming and ventilating the Capitol, page 80, he says:

"The winter experiments are very interesting, and indicate the cause of the complaints which some have made as to the ventilation. They demonstrate that the difficulty lies in a deficiency of moisture in the air. The absolute dryness of the air in the winter is great, and its relative dryness is vastly increased after it has been raised to the temperature requisite for heating the halls. It will not be necessary to take up the results seriatim to prove this. A glance at the table will show how low the degree of relative humidity is; even when, as in Ex. 56–61, the relative humidity of the external air is 100, that of the halls is below the healthy minimum, and, at times, the moisture falls to 20. The mean relative humidity at 2 p. m., for the external air of the five Januarys of table 1, is 67. The remedy for this defect consists in adding to the air of the halls from sixteen to thirty-five pounds of water per minute for a ventilation of 60,000 cubic feet of air per minute. This moisture must, as was said, for the summer experiments, be added intelligently. Too much water would be as injurious as too little."

The shafts or avenues of escape, which were found closed off, have been opened. They lead from the space between the ceiling and the roof of the Senate chamber, down to the sub-basement, and there they are connected to ascending shafts which lead to the open air. I found them both, however, inadequate, for whatever of escape did take place was insufficient and irregular from defective arrangements. I was at once convinced of the importance of having exhausting power applied at the point where the vitiated air could be removed, and I am indebted to the honorable Secretary of the Navy for the temporary use of one exhaust fan, with engine attached, which has been placed in a horizontal portion of one shaft leading from the descending shaft to the ascending one in the lower basement. The fan has a capacity of about one-fourth as compared with the entrance movement, produced by the fan for the introduction of fresh air. Being unable to secure another exhaust fan for the other shaft, I have substituted a coal stove, which, however, is not equal to an exhaust fan, but assists in the removal of the impure air.

The fan used to supply the committee rooms and passages being of no use in warm weather, owing to the doors and windows being open and the registers generally kept closed, the fan used for the Senate chamber being inadequate to force in a sufficient supply of fresh air during the months of May, June, and July, and more particularly during the evening sessions, I have connected the two main air-ducts so that both fans can be used to increase the supply of air in the chamber when necessary, or may be used separately as before. This improvement having been completed on the 15th of last August, and the experiments on the 20th of the same month, will show the following results. The following tabular statement will show that by a circulation of water through the coils of pipe that are located in the main air-duct used for heating the chamber in cold weather, also allowing a sheet of water to pass down both air-ducts, will not only reduce the temperature to that degree which will keep the chamber moderately cool and comfortable, but will remove all dust that is drawn in by the action of the fans. The following will show the results of the experiments, August 20th, and the different degrees of temperature:

Time.	External air.	Main air-duct.	New air-duct.	Senate chamber.	Galleries.	Space above ceiling.
	°	°	°	°	°	°
10 a. m.	95	95	95	90	92	100

At 10.15 a. m. both fans on Senate chamber evaporators and exhaust fan in operation:

Time.	External air.	Main air-duct.	New air-duct.	Senate chamber.	Galleries.	Space above ceiling.
	°	°	°	°	°	°
11 a. m.	100	85	80	82	85	105
12 m	103	80	78	81. 5	83	108

At 12.15 p. m. the fans were stopped. Had they been in operation longer, the results would have been still more favorable. Many complaints having been made on account of the dryness of the atmosphere in the winter season in the committee rooms and passages of the Senate wing, I have endeavored in part to obviate this difficulty by placing evaporating pans over the top of each one of thirteen coils which heat the above-mentioned rooms and passages, leading water pipes into the same with valves to regulate the supply of water in order that the heated atmosphere may take its own supply of moisture before reaching the registers leading into the said rooms and passages.

In view of the favorable results obtained by the evaporation of water above the coils, I therefore recommend that evaporating pans be placed over the remaining fifteen coils.

Many complaints having been made by the honorable Senators and others in reference to the descending currents of cold air from the ceiling and over the sides of the galleries down on the floor of the chamber, this defect has been referred to by several gentlemen of high scientific attainments, who have written interesting and very able reports on the ventilation of both wings of the Capitol. I am, however, unable to find any remedy recommended by them. In a report on the warming and ventilating of the United States Capitol, by Professor Joseph Henry, he says:

"It is true that in some cases during cold weather descending currents of cold air have been observed, due to the cooling of the ascending columns as they come in contact with the under surface of the roof, as was evident from the odor of gas when the burners above the ceiling were first lighted. That there is a tendency to form such descending currents is clear, since, unless the air is immediately withdrawn from the space beneath the roof before it is cooled, and thus rendered heavier than the ascending air, it will descend in parallel streams, but to determine how frequent and extensive these currents are, further experiments will be necessary."

Experiments on the 8th, 9th, and 10th of January last show that the descending currents of cold air seemed to be confined to the northeast and southeast corners of the chamber, commencing at the Vice-President's chair and extending around to the doors leading to the rotunda. On the northwest and southwest sides the currents ascend with considerable regularity. The cause of this defect—the descending currents of cold air from the ceiling—is owing to the difference of temperature at the ceiling and the space above it, and the material of which the ceiling is composed.

The heated air ascends until it comes in contact with the cold, metallic surfaces, when it becomes suddenly reduced in temperature below that on the floor, and all that fails to pass through the perforations becomes heavier than the air below, and will therefore descend until it reaches the floor. Coils of steam pipe have been placed above the square registers located in the space above the ceiling, so that the temperature of the atmosphere can be raised to or above that of the air on the chamber floor, which, I believe, will obviate in part, if not entirely, this difficulty, for whenever the ceiling is lighted I find that the cold air ceases to descend; the steam can then be closed off. For the purpose of improving the present method of ventilation of the Senate chamber, I respectfully recommend that escape pipes be made and connected to the square registers located in the space above the ceiling, and that they be conducted into the escape shafts, and all other perforations be closed, so that the gas-lights above cannot affect the air in the chamber, and that the shafts of escape be enlarged so that they will have a capacity adequate for the removal of vitiated air, and that two exhaust fans, having a capacity of three-fourths as compared with the fans for the introduction of fresh air, be placed in the sub-basement for that purpose.

The expenses attending the improvements herein recommended are as follows:

Two exhaust fans	$4,000
One engine	2,000
Escape pipes	800
For enlarging escape shafts, and setting engine and fans	1,500
	8,300

It will be seen, therefore, that, with a comparatively little expense, a pleasant and wholesome ventilation can be secured, without producing any unpleasant currents whatever.

Respectfully submitted.

H. F. HAYDEN,
Chief Engineer Heating and Ventilating Department U. S. Senate.

Hon. J. W. NYE,
Chairman Joint Select Committee on Ventilation.

ARCHITECT'S REPORT ON PROPOSED IMPROVEMENTS.

ARCHITECT'S OFFICE UNITED STATES CAPITOL EXTENSION,
Washington, D. C., February 6, 1871.

SIR: I have the honor to state herein the changes which have been made under the direction of your honorable committee, in order to improve the lighting and ventilation of the hall of Representatives.

A row of iron panels around the skylight in the ceiling has been taken out, and panels of ground glass substituted. Gas-lights have been placed over these. The louvres or blinds under the outer skylight have been so arranged as to admit of all on one side being adjusted at the same time, thus rendering it easy to open all the light, or to so cut it off as to prevent the rays of the sun from coming into the hall.

No change has been attempted in the system of ventilation, but some efforts have been made to make it more efficient and to correct some disturbing causes.

The under side of the copper roof has been plastered, by which radiation in cold weather, causing draughts to descend, particularly at the back of the galleries, has been overcome.

The galleries have likewise been made more comfortable by converting the space between their floors and the ceiling of the coat rooms below into an exhausting chamber, instead of hot-air ducts, as heretofore.

Fire-places have been made in the cloak rooms, and ventilators placed over all gas-lights, running to the hot flues. Windows have been pierced at several places at the ends of these rooms. These constitute the principal changes, and, so far as I have observed, they have been attended with marked success.

There are other improvements which observation and experience suggest, which, if executed, will, in my judgment, go far in perfecting the present system of heating and ventilation.

The flues for the egress of foul air should be enlarged. At present the area of discharge is 25 superficial feet, while the flues are capable of being enlarged to twice that capacity—a size sufficient for all purposes.

The under side of the roof over the corridor should be plastered to prevent radiation and air leaks, and ventilating caps should be placed over these corridors, so arranged that in cold weather, when strong winds from a southerly direction pack against the dome, they may be closed, to prevent currents of cold air descending. I suggest also that the small registers in the floor be taken out, as they are now receptacles for dust and tobacco, and their places supplied by registers in the front and ends of the platforms. In case the change of the register is made I would recommend that the old floor, which is nothing but a piece of patchwork, be taken up and a new floor of walnut put down.

The heating flues under the floor should also be rearranged. I will here state, as I have already verbally, that I consider it very important to the proper working of the heating and ventilating apparatus that an attendant should be placed in the loft to attend to the adjustable parts there, as the weather and the state of the light and winds may demand. Below is submitted the estimated cost of the further improvements herein proposed:

Enlarging foul air shaft	$2,500
Plastering ceiling of corridors	500
Readjusting flues under floor	1,000
New register	500
New floor of walnut	4,000
	$8,500
Eight ventilators on roof	1,200
Total	$9,700

If your committee should determine to use fans for the expulsion of the vitiated air, a further sum of $7,500 would be required for them and for the necessary steam-engine.

Very respectfully, your obedient servant,

EDWARD CLARK, *Architect.*

Hon. THOMAS A. JENCKES,
Chairman Select Committee on Ventilation,
United States House of Representatives.

ARCHITECT'S REPORT ON COOLING APPARATUS.

ARCHITECT'S OFFICE, UNITED STATES CAPITOL EXTENSION,
Washington, D. C., February 23, 1871.

SIR: I have examined the proposition of Mr. L. Bouvier for cooling the corridors of the House of Representatives by means of Tellier's refrigerating machine.

Mr. Bouvier says, to effect this, all the doors and windows leading out from the corridors must be kept as securely closed in summer as in winter, and that double partitions, with doors, must be put in at each end of the connecting corridor. This arrangement, I consider, would prove very unsatisfactory, if not impracticable; it would further aggravate what many consider the most objectionable feature in the present plan—the absence of lateral ventilation. While I am anxious to see experiments tried to obtain more comfort, yet I consider this undertaking unreasonably expensive to obtain, at best, a doubtful result.

I would be glad to see a small refrigerating machine used in the main air duct, in order to lower the temperature a few degrees in hot weather, which, I believe, could be done at an expenditure of a few thousand dollars.

The papers referred to me are herewith returned.

Very respectfully, your obedient servant,

EDWARD CLARK,
Architect.

Hon. THOMAS A. JENCKES,
Chairman Committee on Ventilation,
United States House of Representatives.

Hon. THOMAS A. JENCKES:

DEAR SIR: At your request, please find estimate for making a change in the arrangement in lighting the ceiling of the hall of Representatives, viz: To light the new border panels without lighting the center panels, it will require an independent service pipe, running the entire length of the border panels, as also an independent magnetic engine for turning on or off the gas with one line of isolated wire. The following is a correct estimate:

For 2 ½-inch gas-pipes, with fittings, &c., complete	$450 00
For magnetic engine and stop-cock complete	500 00
For isolated wire	6 00
For electric connection key to instrument	5 00
For labor	80 00
	1,041 00

Yours, respectfully,

SAM'L GARDINER,
Electrician.

The committee ordered the work, for which the foregoing estimate was made, to be done, and have paid for the same out of the appropriation to be expended under their direction. The beneficial effect of the alteration can be perceived whenever the lighting of the hall takes place during the twilight. The burners over the new plates of ground glass sometimes furnish sufficient light for the hall without lighting those over the large squares. Until this alteration was made all the burners had to be lighted at the same time.

EFFECT OF HEAT FROM THE BURNING GAS IN THE SENATE CHAMBER.

Temperatures of the United States Senate, June 24, 1870.

PROPOSITION OF HENRY A. GOUGE.

To the Honorable John Covode, Chairman of the Committee on Public Buildings and Grounds:

SIR: In presenting my system of ventilation for the consideration of your committee, I beg leave to call your attention to the following:

The present appliances for ventilating the House of Representatives fail utterly to accomplish that object. It is true that currents of fresh air are *forced into* the apartments, but they, from their nature, put obstacles in the way of accomplishing the object sought, by producing counter or eddying currents; and, in addition to this, the means of egress for the vitiated air are inadequate and very imperfect. Of course, if air is forced *in*, air must be forced out; probably that was the theory on which the present system was based. But in this case the greater portion of air thus forced in leaves the hall precisely in the condition it entered, and its egress is at the doors to a great extent.

The copper roof and space between the roof and ceiling are great obstacles in the way of ventilation, the more so because the space communicates, through holes in the ceiling, with the hall below. In the winter the heated air rises to the ceiling along the walls, and creeping thence to the openings in the ceiling to the cold space above where it is condensed, (the copper roof conducting off the heat very rapidly,) and falls of its own gravity through the openings nearer the center of the ceiling to the floor of the House, where its influence is disagreeably felt. The danger of a cold wind on an uncovered head need not be enlarged upon. In this case the danger to health is increased because the descending current has all the deleterious gases and impurities of the ascending current; some of it escapes, no doubt, but the accumulation when the hall is full of people is very rapid, as your committee well know, and I will not enlarge upon it; my object being merely to show why the apparatus used for ventilating the hall fails of accomplishing the duty. Its principal defect is that which I have stated.

The copper roof and space beneath it interfere with the ventilation in summer quite as much as in winter, although from different and nearly opposite causes. The roof absorbs the heat of the sun's rays, and communicates it to the air in the space beneath, and often raises it to a temperature 30° and 50° above that of the external atmosphere, thus heating the ceiling, which radiates powerfully on the heads below; and the eddies produced by the forced currents of air from the registers induce downward currents of this air from the reservoir above; thus the temperature of the apartment is kept up to a high degree. The eddying currents of air cannot be avoided where direct streams are forced.

My system consists of forcing the vitiated air out of the apartment, and supplying its place with pure air from outside the building. It will absolutely prevent the currents of cold air from above in the winter and hot air in the summer, as it is my purpose to destroy communication between the hall and the reservoir above, and to prevent radiation from the ceiling. This can be done very easily.

My system of ventilation will, without the aid of any machinery, or power applied externally to the ventilating tubes, completely *change the air in the hall as often as may be desired*; fresh air being constantly supplied through tubes under the floor and furnished with registers.

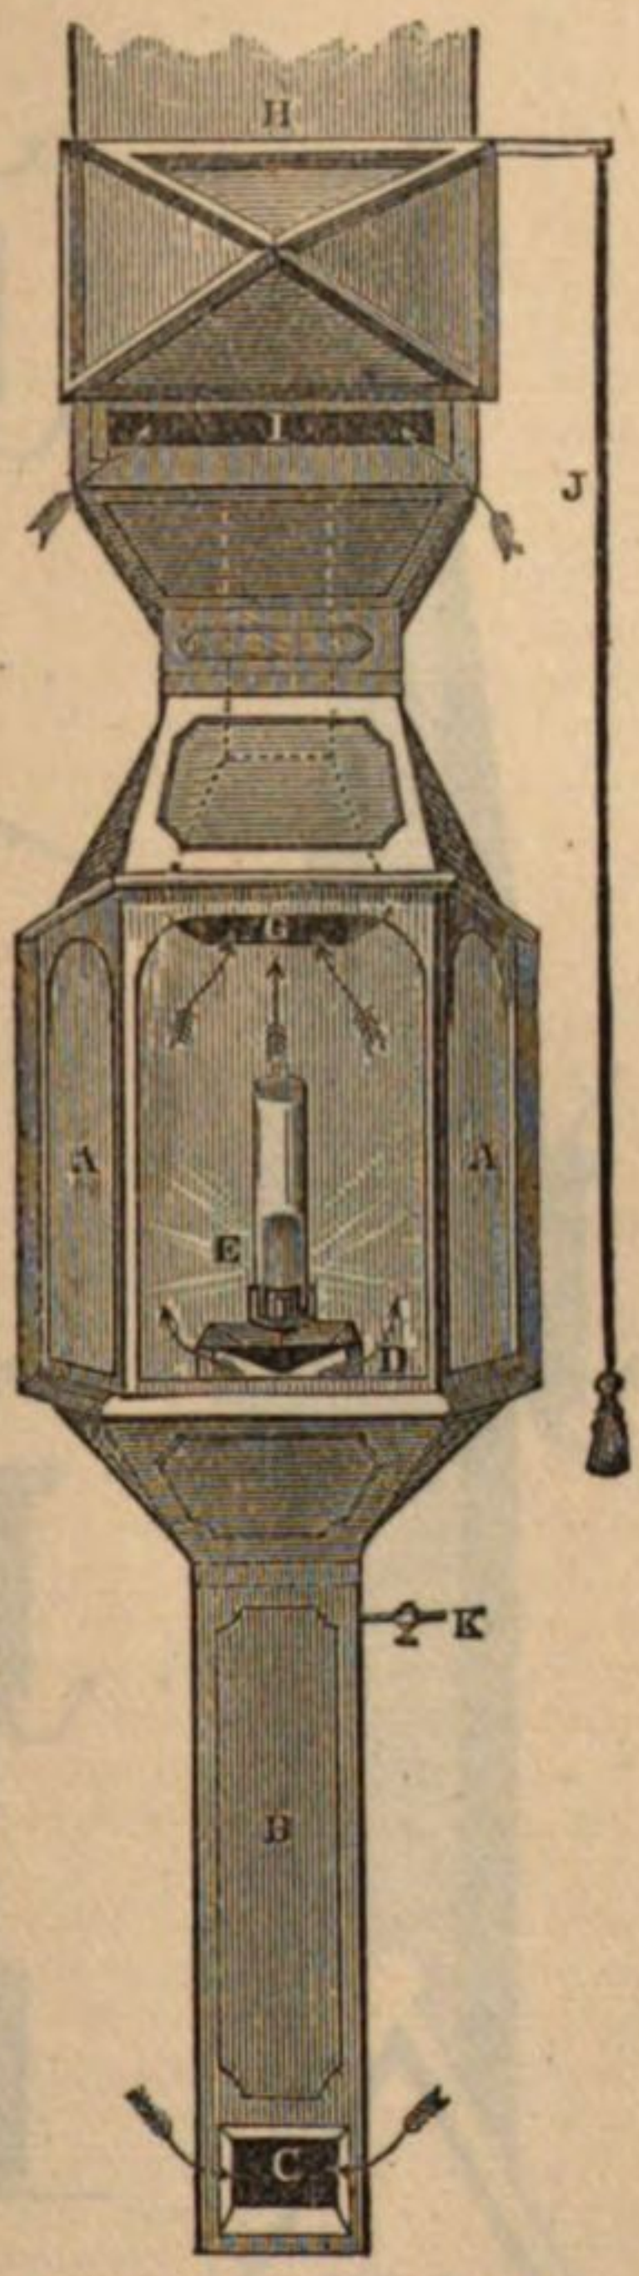
To prepare the hall for my ventilating tubes to work successfully, it will be necessary to close up the holes in the ceiling, which are fruitful sources of trouble, not only as regards ventilating, but also by interfering with the acoustic properties of the hall. To do this I propose to cover the entire ceiling, excepting the glass panels, with hair felt, which, being a non-conductor of heat, will effectually prevent the ceiling from being affected by the temparature of the space above it, and by this single precaution overcome two very important difficulties in the way of perfect ventilation.

My ventilating apparatus consists of tubes running from the floor to a proper distance above the roof. These tubes are provided with openings at the floor, ceiling, and such intermediate points as may be deemed expedient. In the tubes, and at a proper distance above the floor, I place a lantern containing an "argand" or other burner, consuming gas or whatever may be most convenient. The burner is placed in the center of the lantern and serves to produce a powerful upward current. By placing a pyramidal tube or inverted funnel over the burner the current of hot air is contracted and its speed augmented, which, entering a duly expanded tube above, induces another current of great force. Openings are provided above as stated, and the air supplied at these openings augment largely the ascending current, the tube being properly expanded at each opening.

To adapt this to the hall of the House of Representatives, the tubes are placed in the wall running up behind the niches in the gallery (twenty-eight in number) entirely out of sight, and extending down into the coat rooms under the gallery, where the lantern is placed, which, while giving motion to the column of air, sufficiently lights the apartments. Openings are made through the partition into the hall, at the floor, from

GOUGE'S ATMOSPHERIC VENTILATOR.

PATENTED MAY 26, 1863; APRIL 25, 1865; AND MAY 9, 1865.



A. A Ventilating Lantern, with an Argand burner.

B. Ascending flue or air duct.

C. Opening in duct at or near the floor, for the admission of air.

D. Diaphragm for regulating the admission of air to the gas jet at E.

G. Opening of interior flue for concentrating the heated and expanded air.

H. Ascending portion of the large flue or metalic air-duct, terminated above the roof by a weather cap.

I. Aperture into which the foul and heated air at the ceiling is drawn by induction.

J. Cord for opening or closing the register at I.

K. Tube for conveying gas to the gas-burner at E.

☞ The arrows indicate the up-moving currents of air.

☞ The combustion of the gas jet at E is supported by the air which enters at C, and along with this air, which acquires a powerful ascensional force through the burning gas jet, the carbonic acid, and other impurities, ascend and mingle with the heated air and lighter noxious gases which enter the ventilator at I, all passing upward and onward, by virtue of an irresistable motive power, until they are finally discharged into the atmosphere. See illustration, page 4, and "Further Explanations," etc, page 48.

WEATHER CAPS

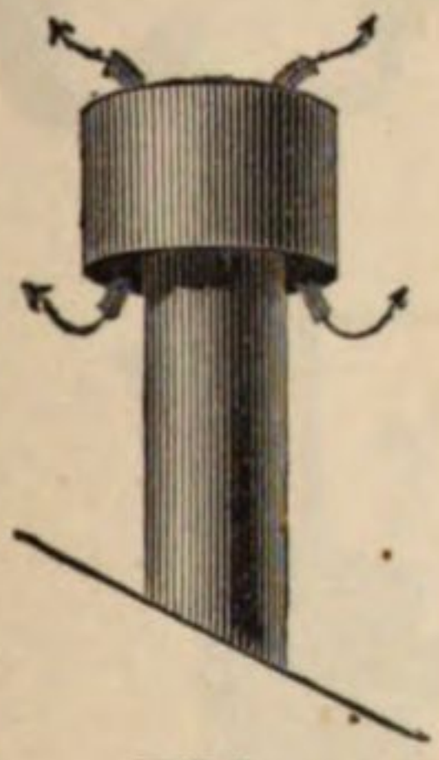


FIG. 1

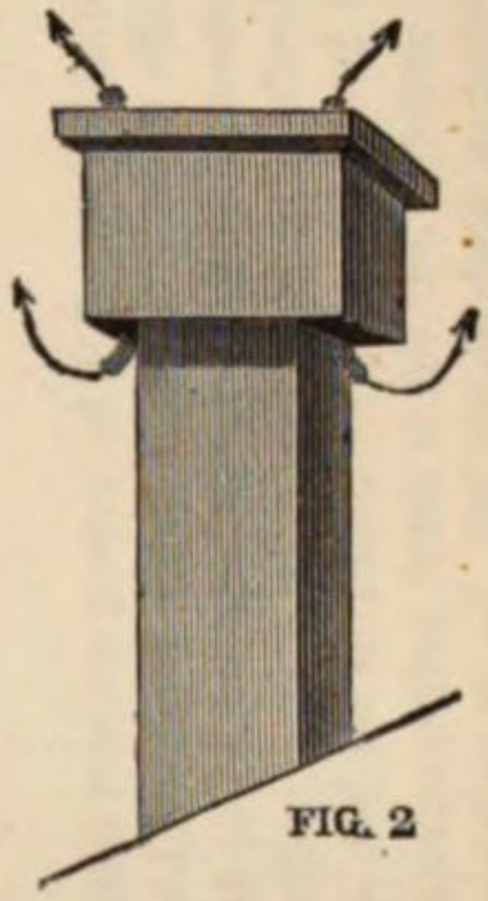

FIG. 2

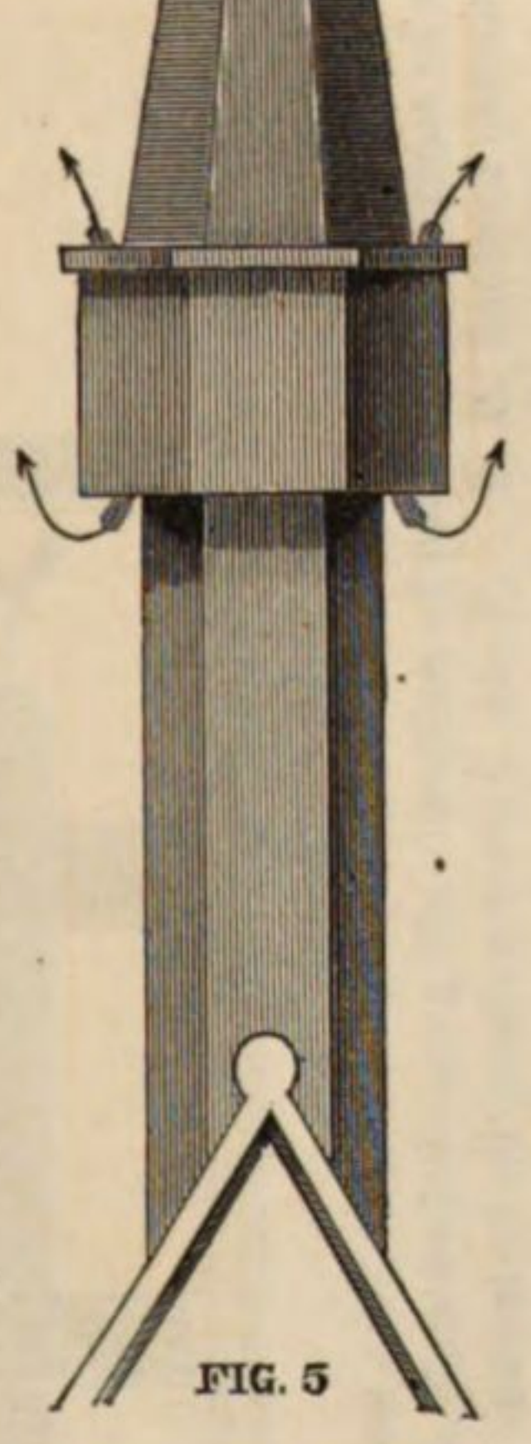

FIG. 5

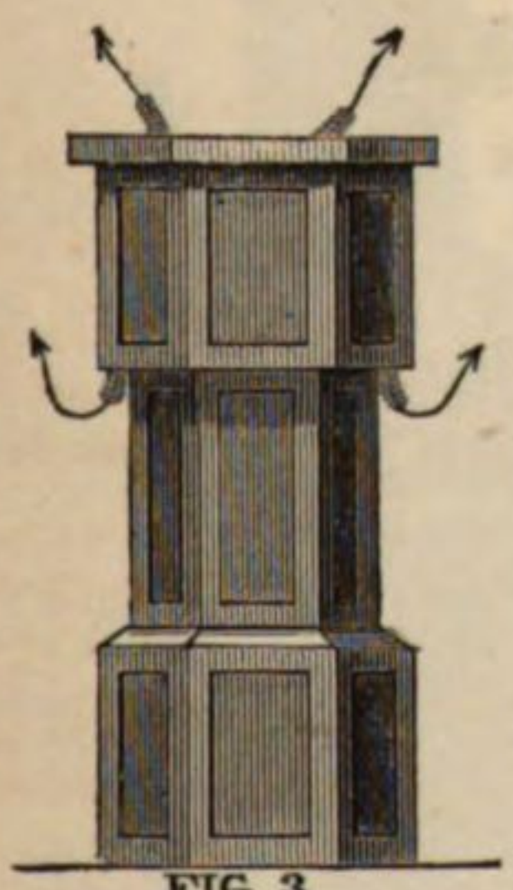

FIG. 3

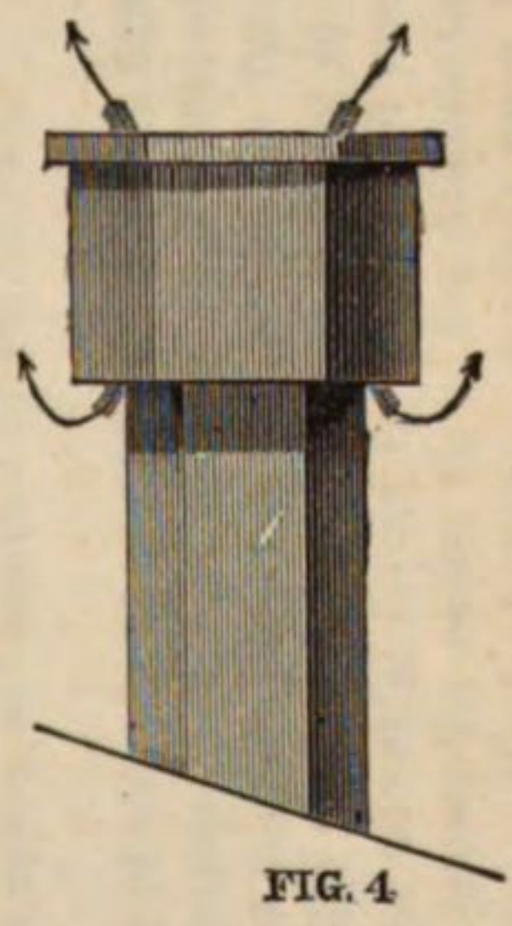

FIG. 4

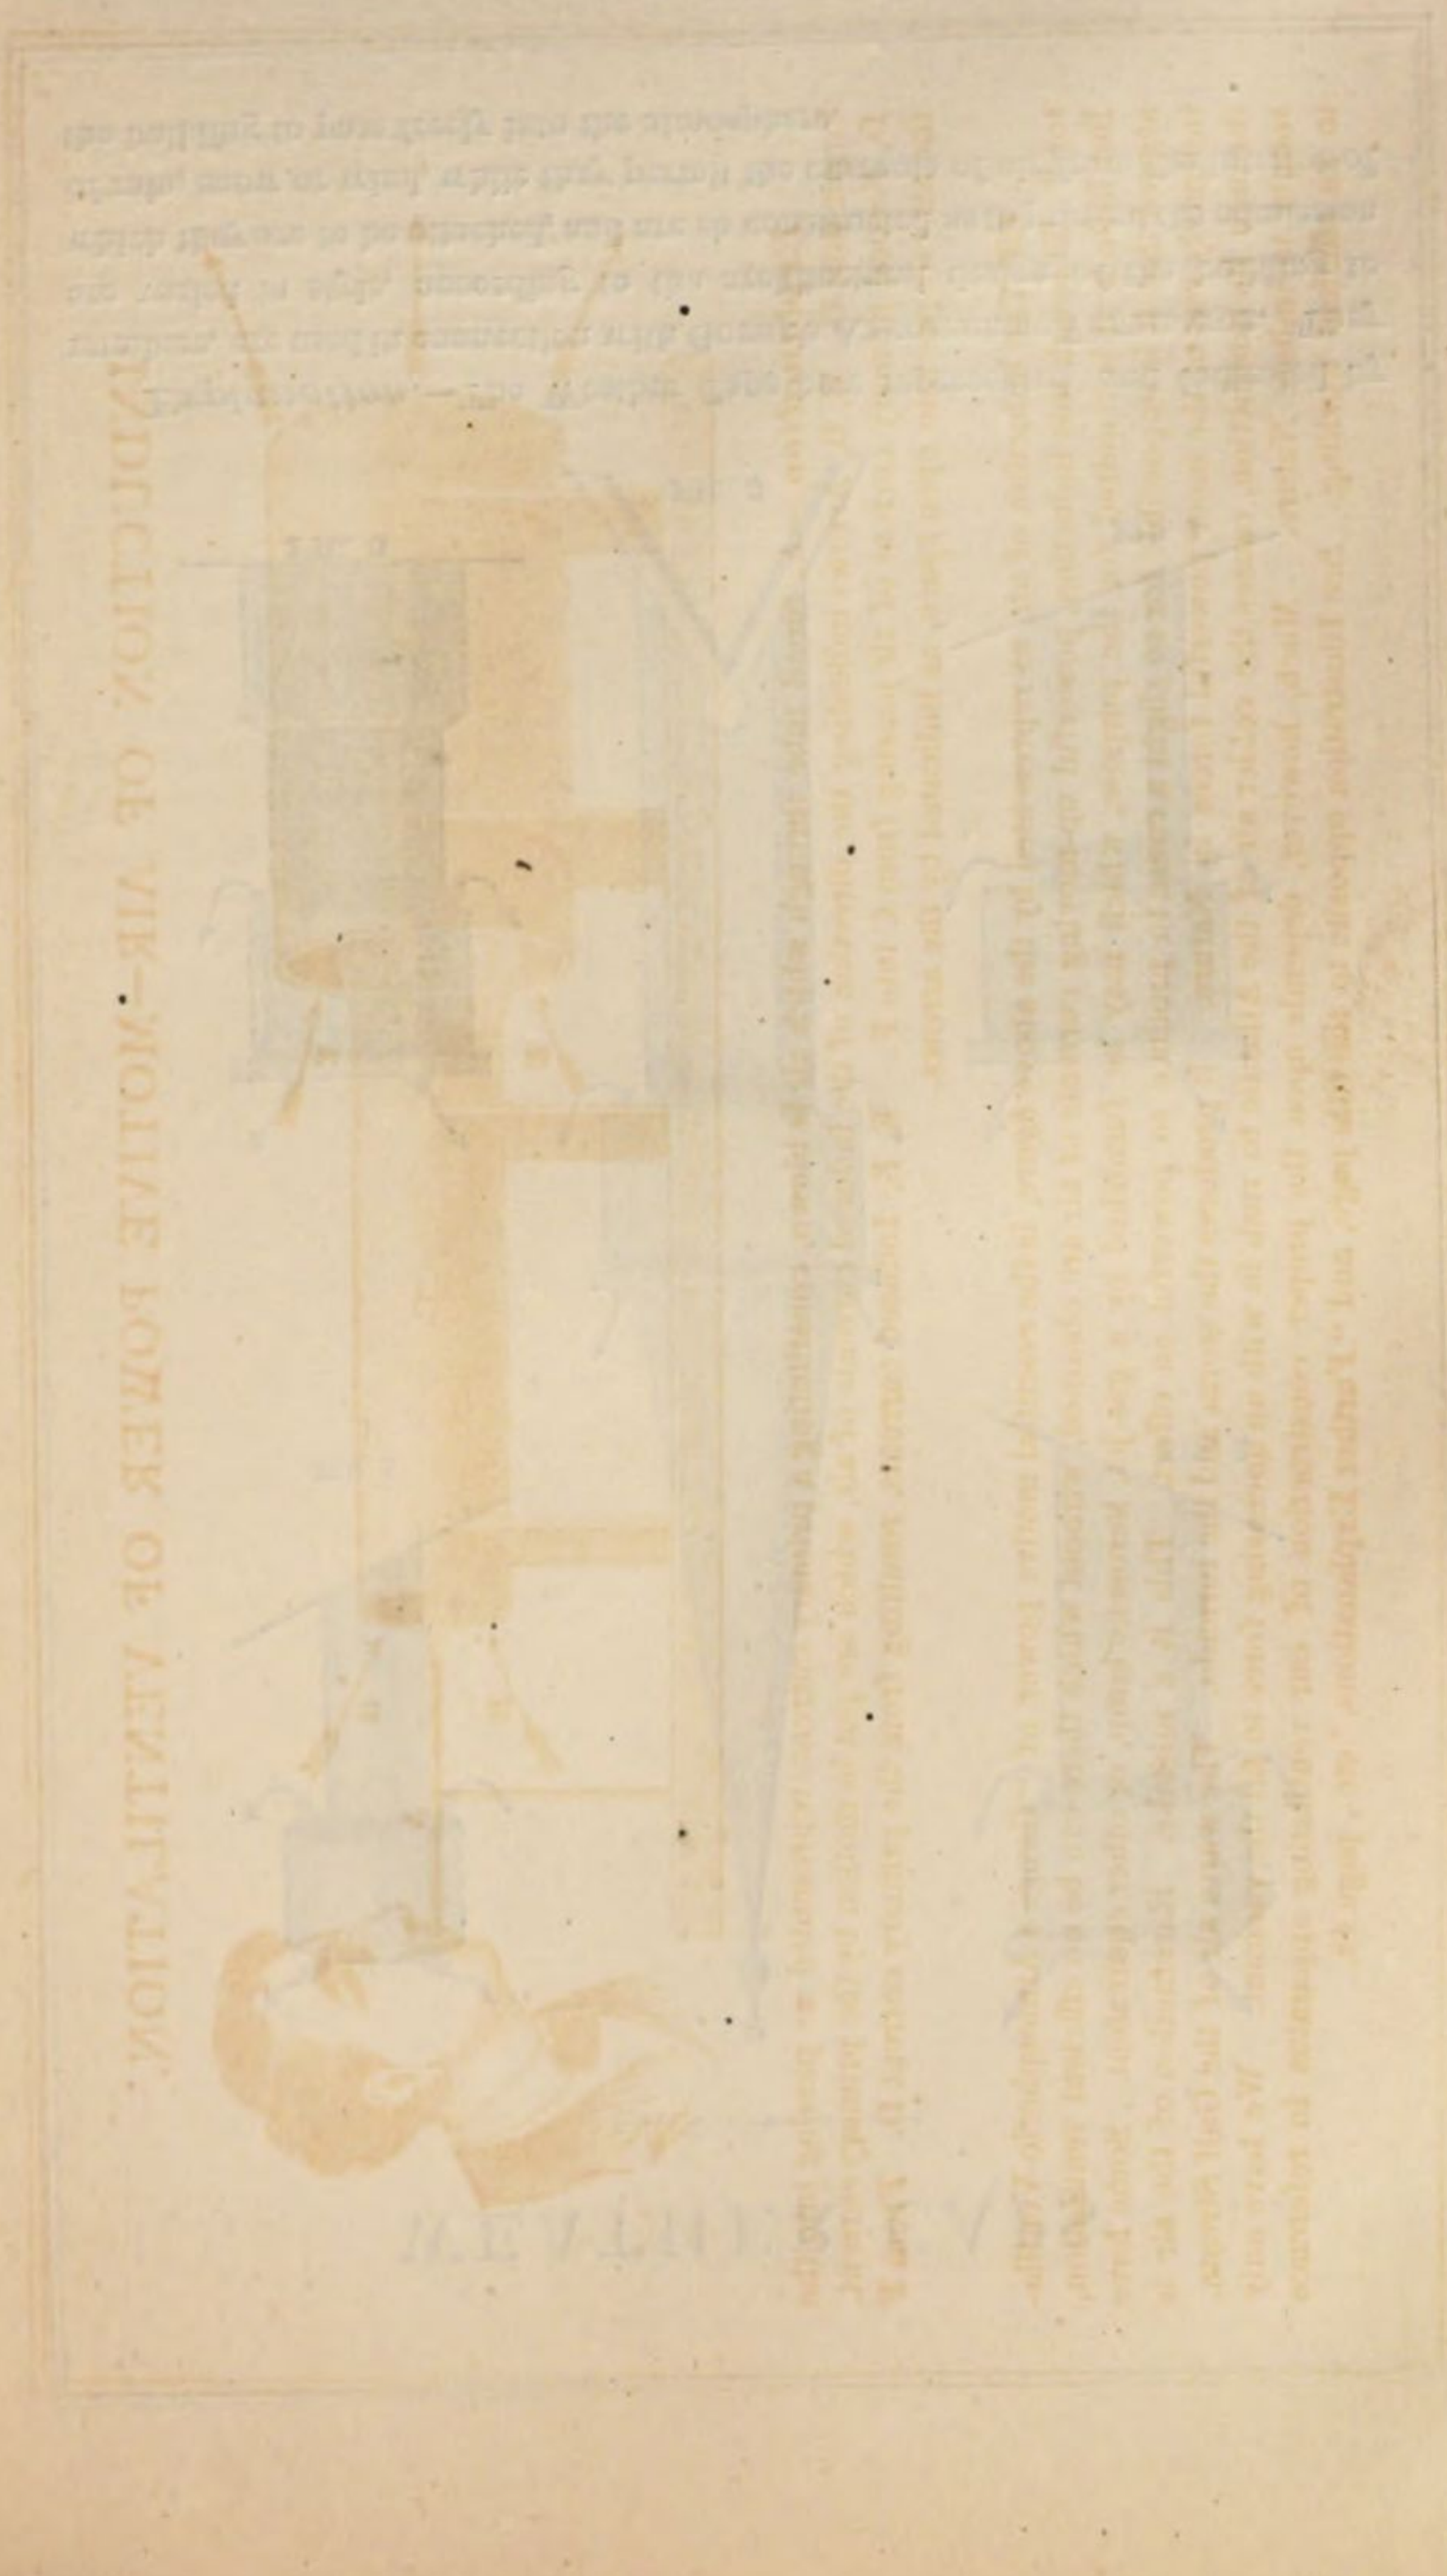
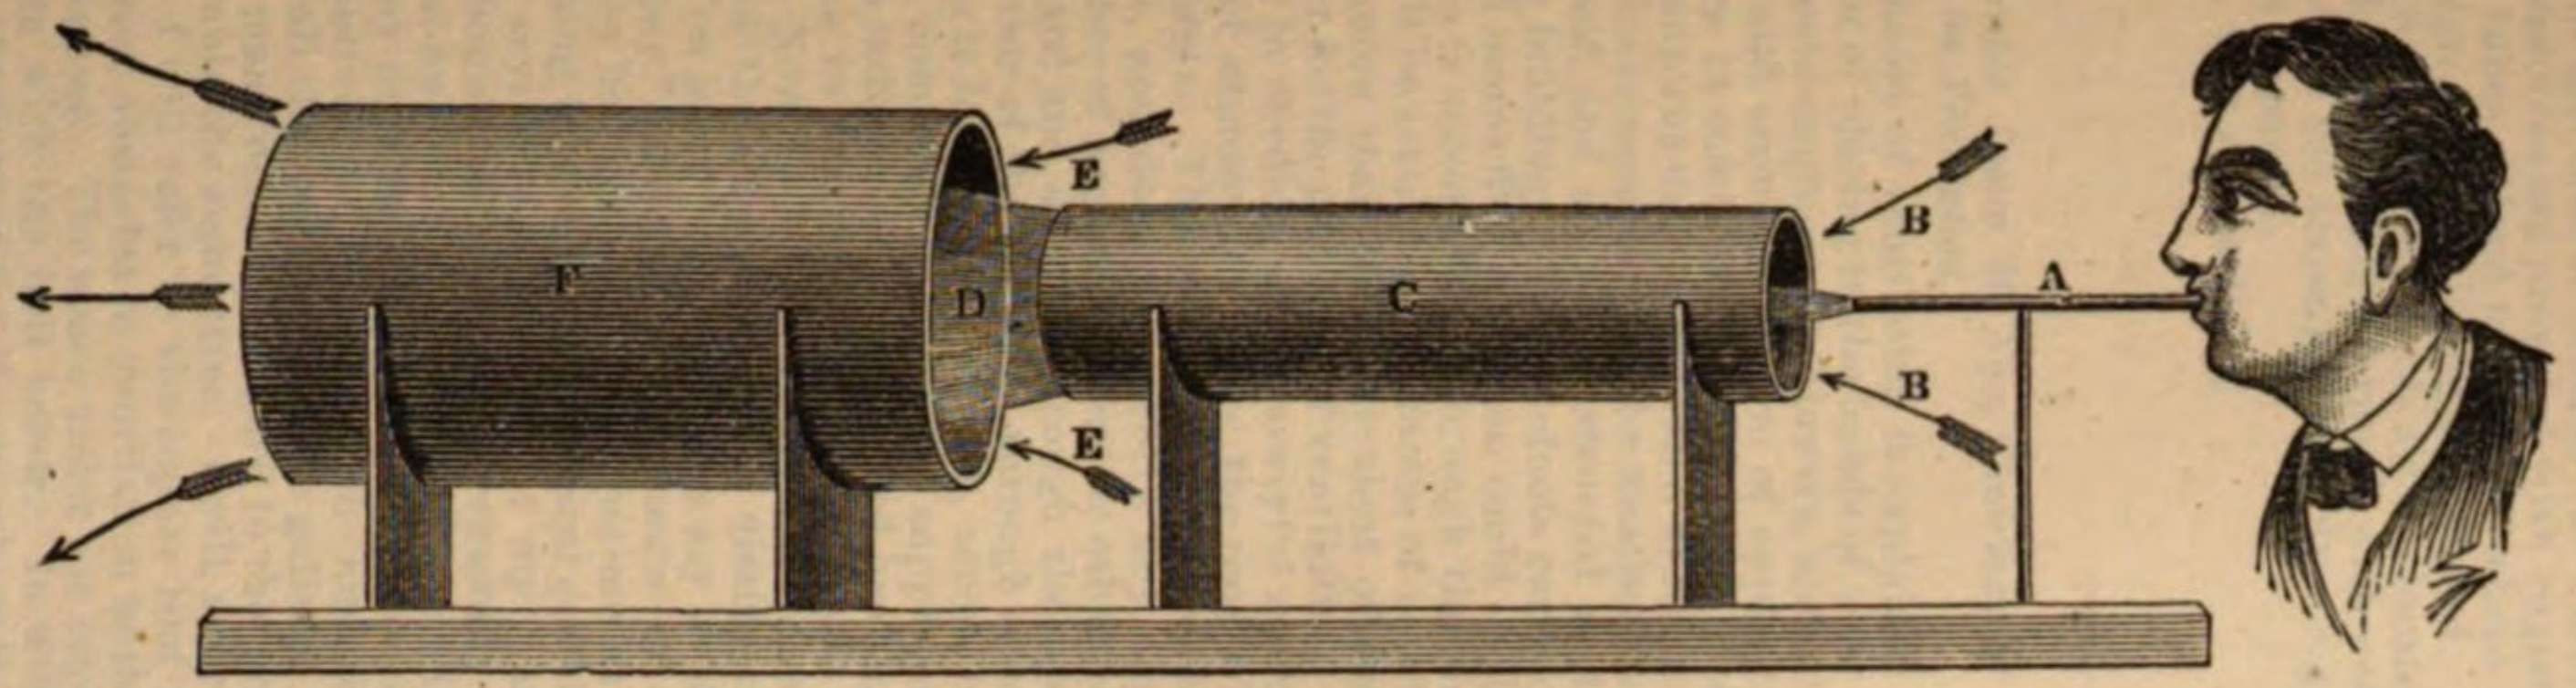
Explanation.—The Weather Caps here represented, and indicated by numbers, are used in connection with GOUGE'S ATMOSPHERIC VENTILATOR. They are varied in style, according to the architectural design of the building to which they are to be attached, and are so constructed as to prevent the admission of rain, snow or wind, while they permit the currents of air from the interior of the building to pass freely into the atmosphere.



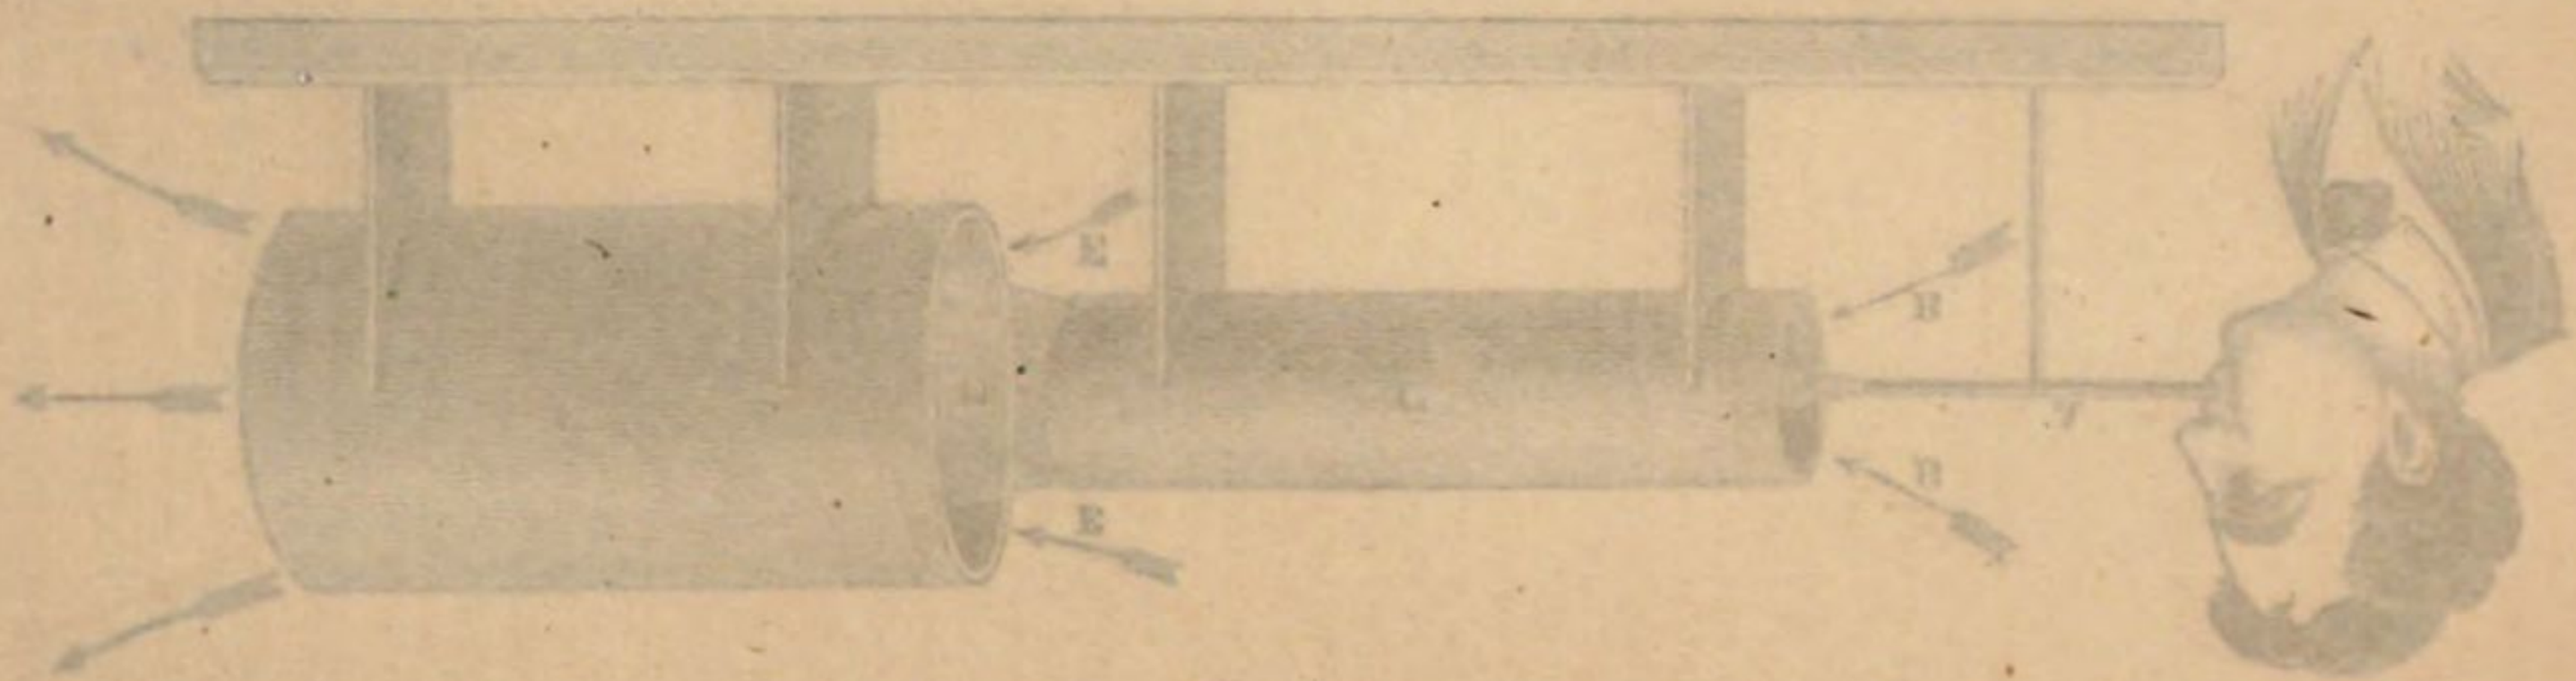
VOLTAIC BATTERY OF VARIABLE POWER

INDUCTION OF AIR—MOTIVE POWER OF VENTILATION.



Explanation.—A, Small tube through which air is blown, constituting a primary current, represented as passing into the larger tube C. B, B, Arrows indicating the direction of the induced currents of air, which are put in motion by the primary current. D, Second primary current of air passing from C into F. E, E, Induced currents, resulting from the primary current D. From F the air escapes into open space, as indicated by the arrows.

☞ The induction of air, as represented by the above figure, is the essential motive power of "Gouge's Atmospheric Ventilator." Through this induction, powerful up-moving currents of air are obtained, without which there can be no efficient ventilation. But little heat is required for the purpose, which may be furnished by a gas-jet, kerosene lamp, or other equivalent. Some have argued that it is impossible for so slight a cause to produce so powerful an effect. This is a mistake. Rarefaction of the air is indirectly one of the most powerful forces in Nature. It produces the storm and the tornado. The warm air of the Gulf Stream, through its rarefaction, causes the colder air of the Atlantic to rush in with an unceasing force to fill the vacuum. We have only sought to imitate Nature. Much, however, depends upon the proper construction of our ventilating apparatus in reference to its efficient working. See Illustration opposite to the title page, and "Further Explanations," etc., page 48.



INDUCTION OF AIR—MOTIVE POWER OF VENTILATION.

the coat-rooms where the air is by the ventilating tubes through the openings at the floor and ceiling. In the hall, above the niches and immediately under the ceiling, other openings are made for the admission of the lighter vitiated gases from the apartment. These openings are covered by neat and ornamental shields, which can be embellished with the coat of arms of the United States or other approved design. The openings themselves are provided with registers by which the flow of air can be regulated. The tubes extend to the roof, where weather caps, constructed in conformity with the design of the building, are placed.

The tubes for supplying fresh air are located under the floor leading to the open air, and provided, at their inner termini, with neat registers.

By reference to the accompanying drawings the operation and location of the ventilators will be apparent.

Yours, very respectfully,

H. A. GOUGE,
254 *Broadway, New York.*

To the Honorable James M. Nye, Chairman of the Joint Special Committee of both Houses of Congress on Ventilation:

SIR: My theory of ventilation is explained in my book on that subject, which I have had the honor of placing in the hands of your committee. It will be seen that I discard the use of steam-engines, fan-blowers, and all kinds of machinery, and depend upon a more simple and economical form of apparatus, namely, a system of metallic air-ducts or air-carriers, in combination with what I term "ventilating lanterns" and weather-caps. The lanterns may be regarded as induction tubes, and are also useful in diffusing light when this is necessary. The weather-caps are the termini of the metallic air-ducts above the roof, and are so constructed as to be in harmony with the architectural design of the building. The air-ducts carry off the poisoned air from the apartment to be ventilated more efficiently than could be done by the forcing operations of a steam-engine. This is accomplished through the simple law of induction, as explained in my book. It will be seen that the forces of nature, properly guided by the hand of art and science, are more than the equivalent of the steam-engine or any similar motive or forcing power for the purposes of ventilation. The vitiated air steadily ascends through the air-ducts in obedience to a powerful ascensional force, and finally mingles with the great ocean of atmosphere above the roof, where it can no longer poison the blood or stupify the brain. This result takes place without any superintending care during the day or night, and does not involve any expense, excepting what is necessary for a limited number of Argand burners or other equivalent lights. While the impure air is passing upward and onward through the air-ducts, the fresh external air is admitted into the interior of the building through appropriate channels to take its place. The in-flowing air is heated or otherwise, according to the necessities of the case. Thus, we have at our command a bountiful supply of fresh air, which I need not say to your committee is indispensable to life and health, as well as to physical and mental power.

A reference to my book will apprise you of a large number of public and private buildings in New York City and other places, which I have ventilated successfully. You will find the names of many distinguished and well-known gentlemen as my indorsers. You must judge of me by my works. My motto has been, and still is: "No success, no pay." I found in the course of my professional experience that immense sums of money had been paid for experiments in ventilation which proved to be failures, and not wishing to occupy an empirical position in the business of ventilation, I formed the habit of saying to applicants for my professional services that I would either ventilate their houses or buildings successfully or make no charge for my services. On this platform and with this pledge, I am willing to undertake the ventilation of the Capitol or any portion of the same. To be explicit, I will agree to ventilate the House of Representatives and furnish all the material and labor for $50,000. The ventilation will include all the rooms under the gallery.

There are many details in regard to the proposed ventilation with which, perhaps, I need not trouble the committee. I will, nevertheless, make a few explanatory remarks. First of all, I will refer to the copper roof and the space between it and the ceiling, which are great obstacles to ventilation both in summer and winter, but from different or opposite causes. The space under the copper roof communicates through apertures in the ceiling with the hall below. In winter the cold air descends through these apertures to the floor of the House, where it makes an unpleasant impression upon the members. It is also highly prejudicial to health, as it carries with it, in a condensed form, all of the poisons of the heated atmosphere. In summer the air space under the roof becomes exceedingly hot, and is frequently from 30° to 50° above the temperature of the external air. The ceiling becomes heated as a necessary consequence, and radiates its heat very uncomfortably to the hall below. Moreover, the forced currents of air from the registers induce downward currents of air from the heated reservoir above, which I need scarcely say is highly objectionable and prejudicial.

Should I ventilate the hall, as specified, it would be necessary for me to close the apertures in the ceiling, which, in addition to the objections already named, interfere with the acoustic properties of the hall. In doing this, it would be necessary for me to cover the entire ceiling, excepting the glass panels, with hair felt, which, being a non-conductor of heat, will prevent the ceiling from becoming heated in summer or chilled in winter, and thus two important difficulties in the way of ventilation will be obviated.

It will be a part of my plan to place the air-ducts in the wall, behind the niches in the gallery, (twenty-eight in number,) where they will be entirely out of sight. They will extend downward into the coat-rooms under the gallery, where the lanterns will be adjusted, and which, in addition to ventilating purposes, will sufficiently light the various rooms. I will not trouble the committee with further details, as I hold myself in readiness, if called upon, to furnish the committee with any additional explanations which they may desire.

I will add that I propose to make the air-ducts within the hall of galvanized iron, while the weather-caps, and everything above the roof, I propose to make of copper. This is also the judgment of the Architect of the United States Capitol, Edward Clark, esq., in which I entirely coincide.

I have the honor to subscribe myself, very respectfully, yours,

H. A. GOUGE.

NEW YORK, *March* 22, 1870—254 *Broadway.*

PLAN AND PROPOSITION OF ALBAN C. STIMERS FOR THE VENTILATION OF THE HALL OF THE HOUSE OF REPRESENTATIVES, SUBMITTED TO A SELECT COMMITTEE OF THE HOUSE IN THE FORTIETH CONGRESS.

[REPORT No. 19.]

OFFICE OF ALBAN C. STIMERS, NAVAL ENGINEER,
No. 45 *William Street, New York, December* 15, 1868.

SIR: Agreeably to your request that I should prepare for the committee a detailed report which should express my views upon the proper method of ventilating the hall more fully than was done in my letter to you upon this subject dated July 20, 1868, I beg leave very respectfully to submit the following report:

The term *ventilation*, when applied to a hall of this importance, should signify *the production and maintenance within doors of pure air, properly tempered with heat and moisture, regardless of the existing state of the weather.*

Thus, to maintain the air pure in any inclosed space occupied by persons, it must be constantly renewed; when the weather is cold, the air of renewal must be warmed; when it is hot, it must be cooled; when it is too dry, it must be moistened; and when it is too moist, it must be dried. Further: when air is warmed simply, its relative humidity is lessened; and when it is cooled, this is increased; so that generally, when air is warmed, it must be moistened; and when it is cooled, it must be dried.

Properly, however, the degree of moisture in the space ventilated should be as carefully observed as that of its temperature, and that which is most pleasant and healthful should be uniformly maintained, regardless of the condition of the outer air, or of the modifications which may have been made in its temperature.

A consideration of the subject is therefore properly divisible into the following heads:

1. The quantity of air necessary and how it should be introduced.
2. Warming and moistening the air in cold weather.
3. Cooling and drying the air in hot weather.

The subject of regulating the degree of moisture in the air when it is neither warmed nor cooled, is naturally involved in the above.

I. THE QUANTITY OF AIR NECESSARY AND HOW IT SHOULD BE INTRODUCED.

In treating of the quantity of air required for ventilation, writers generally refer to the number of cubic feet required per minute for each person in the apartment. This mode does not, however, take into consideration the vacant spaces where the air comes and goes without having come in contact with persons.

Every person is at all times surrounded by an envelope of vitiated air, and the thickness of this envelope is dependent upon the direction and velocity of the air past the person. Thus, the average man is 5 feet 8 inches high, and 1 foot thick from front to back. If, therefore, the direction of the current of air past the person is vertical, it will require to have $5\frac{2}{3}$ times the velocity that would be necessary, if the direction was horizontal, to maintain the same thickness or rather thinness of the vitiated envelope.

Dr. Wetherill, in his very interesting and able report on the ventilation of the Capitol extension, page 66, says:

"Hood (Warming and Ventilation, p. 261) estimates the air required for ventilation by the amount needed to take up the moisture from the skin and lungs. The air required for respiration (*i. e.*, oxidation) is very much less than that needed to hold in solution the vapor of the skin and lungs, which evolve 12 grains of water per minute. If the temperature of a room be at 60°, with a dew-point of 45°, a cubic foot of air will absorb 2¼ grains of vapor; or, in other words, the perspiration from the body will saturate 5¼ cubic feet of air per minute. If, however, we take the dew-point lower, say not to exceed 20° or 24°, then 3¼ cubic feet of air per minute will be required to carry off the insensible perspiration; while for the pulmonary supply one-fourth cubic foot will be needed, making a total of 4 cubic feet. In summer, as the dew-point is higher, more air will be needed, viz, 5 cubic feet per minute for summer ventilation."

In a foot-note to the above it is stated that Seguin gives the exhalation of water from the lungs, 7; from the skin, 11; total, 18 grains per minute.

This is undoubtedly the correct method of ascertaining the number of cubic feet of air vitiated by each person per minute, and, as will appear further on in this report, the dew-point should be maintained uniformly at 52°. Assuming this, we can make the calculation of quantity exact for this case.

A cubic foot of air at a temperature of 65°, with the dew-point at 52°, will absorb 2½ grains of vapor, and if we take the mean of the two authorities above cited, regarding the quantity exhaled by each person, we will have 15 grains per minute, and to absorb this under the above conditions will require 6 cubic feet of air. Add to this the one-fourth cubic foot required for breathing, and we have 6¼ cubic feet as the total amount vitiated per minute.

The surface of an average man is about 18 square feet. If, therefore, we imagine such a man walking in the pure open air at the rate of two miles an hour, on a perfectly calm day, the air will be flowing past him at the rate of 176 feet per minute, and, as he is one foot deep from front to back, the average thickness of the envelope of vitiated air which surrounds him may be found as follows:

Let a = The quantity of air vitiated per minute in cubic feet ..... = 6¼
b = The surface of the person in square feet..... = 18
c = The extent of the person in the direction of the current of air in feet. = 1
d = The velocity of the current in feet per minute..... = 176
x = The thickness of envelope in inches—

$$\text{Then } \frac{12\ ac}{bd} = x,$$

and $x = 0.018$, or $\frac{1}{55}$ of one inch.

In supplying air for the ventilation of a hall containing an assemblage of people, however, it is absolutely essential that the direction of the current should be vertical; otherwise that which has been vitiated by one person will be given to another to breathe and perspire into.

If, now, we assume a man standing upright of the average height of 5 feet 8 inches, and the velocity of the current at 5 feet per minute, we will have for the value of the terms in the above formula:

$a = 6\frac{1}{4}$
$b = 18$
$c = 5\frac{3}{8}$
$d = 5$

Whereupon $x = 4.16$ inches.

If this envelope of four inches thickness of vitiated air be drawn upward, it is clear that the nose and mouth will be always supplied entirely with vitiated air, no matter how pure it may be one foot away; while, if it is drawn downward, those organs will always be supplied with perfectly pure air.

This consideration alone is quite sufficient to determine us in favor of the downward direction; there are, however, some other advantages in the downward over the upward direction, which it may be well to state.

The temperature of the human body rarely varies 2° either way from 98°, a sudden variation of 5° or 6° being said to be fatal. If, therefore, the air is supplied at a temperature of 65°, it will be 32° cooler than the body; with the downward current the head will be in this cool air, while the feet will be inclosed in an atmosphere nearly if not quite as warm as the blood within them. And to "keep the head cool and the feet warm" is one of the fundamental rules of hygiene as well as of comfort.

A current of air coming up through the floor will always bring along with it the fine dust, which the greatest care cannot prevent accumulating there to an extent which renders it unpleasantly sensible in all assemblages supplied with an upward ventilation. With the downward ventilation it is only necessary that the dust shall be thoroughly removed from the inflowing air at the mouth of the inlet duct to maintain the hall perfectly free from dust. To say nothing of the advantages of this on account

of health, the freedom from dust upon the papers to be handled is a luxury every one would keenly enjoy.

Again: with upward ventilation the entire hall is filled with vitiated air, the vitiation having taken place near the point of admission; while with downward ventilation the vitiation takes place near the point of exit, and the whole upper part is full of pure air.

The height from floor to ceiling of the hall is 36 feet; if, therefore, the air is admitted through apertures well distributed in the ceiling, it has 30 feet to move before it comes in contact with the heads of persons on the floor. During this movement all eddying currents, induced by the increased velocity with which it is necessary that it shall pass through the apertures, have become quiet, and the whole mass descends with a uniformity impossible to obtain in the vicinity of the persons ventilated with upward ventilation; and one of the most important considerations to be kept in view in ventilating an apartment is to avoid perceptible draughts.

Mr. Goldsworth Gurney, in his examination before a committee of the House of Lords of the British Parliament, March 24, 1854, said, in reply to the question:

"In those courts which you have ventilated you have found your system answer?

"Yes, we have found the down-current always more agreeable. The up-current is sometimes used, but it is not so pleasing, and not so effectual."

The hall of the Massachusetts house of representatives has recently been provided with new ventilating arrangements, and the downward system has been adopted. The success of the entire arrangement is said to be highly satisfactory.

One objection brought against the downward system is that it is against nature to force air downward. Although this opinion is entertained by an extremely large number of otherwise well-informed persons, every engineer of ordinary attainments knows perfectly well that it is as easy to force air in one direction as another.

Another objection is, that as the air is warmed at the same time that it is vitiated, that which is thus vitiated and warmed has a tendency to rise, whatever may be the direction of the general mass surrounding it. This is true, but this tendency is so feeble that its opposition to a current of 5 feet per minute would not be perceptible.

It has been shown that with a vertical current of 5 feet per minute, the mean thickness of the envelope of vitiated air surrounding a man of the average size, when standing, is 4 inches. This is more than two hundred times as thick as when he is walking at the rate of two miles an hour in a perfect calm. As, however, the air is to be brought from such a direction that the mouth and nose are always supplied with air of absolute purity, and the velocity is sufficient to insure the control of its direction by the mechanical means employed, I have assumed it for the *minimum* velocity to be given.

When the weather is fine, or, in other words, when the outer air, from which the supply is derived, is in the desired condition as regards temperature and moisture, and no expenditure is required upon its condition, then a *maximum* amount may be given, the *minimum* being employed when its condition as regards temperature and moisture has to be changed to the greatest extent. The only limit to the amount of air it will be advantageous to supply is that fixed by the rule that the currents past the person must not be sufficiently rapid to become sensible. Some persons are sensible to currents of much lower velocity than is required to render others conscious of them. Most people can feel a current having a velocity of 150 feet per minute; very few can perceive one of 90 feet per minute. To be quite sure that no one, however delicate, should be conscious of being in a current, I would fix the *maximum* velocity at 50 feet per minute. This will render the average thickness of the envelope of vitiated air surrounding each person, when standing, two-fifths of an inch thick, or twenty times thicker than when he walks at the rate of two miles an hour in a calm. This is stated to show that the *maximum* velocity adopted is not an extravagant one.

The hall is 139 feet 4 inches long by 93 feet wide. The downward current within it would, therefore, have a transverse area of 12,958 square feet. A velocity of 5 feet per minute would then require a supply of 64,790 cubic feet; and one of 50 feet per minute, 647,900 cubic feet per minute. In the arrangement I would propose, the various committee and other rooms would be supplied from the same source as the hall, and to supply these the foregoing quantities should be increased to 80,000 and 800,000 cubic feet respectively. The provisions for heating, cooling, moistening, and drying the air, should therefore correspond with the lesser, while those for propelling it into and out of the building should be adequate to control the greater of the above quantities.

The first method adopted by engineers and architects to give movement to air for the ventilation of mines and buildings, was to heat an upflowing column, thus lessening its specific gravity, and causing it to rise with corresponding force. That system is still employed in the British houses of Parliament, where, in each of its many towers, a charcoal fire is kept burning, and thus a force obtained to propel the air through the building.

It has been practically demonstrated, however, that one pound of coal burned in the furnace of a steam-boiler which furnishes steam to drive a fan-blower, will generate as

much force, and consequently is capable of producing as strong a current of air, as 38 pounds expended in heating a column of air to act by its diminished gravity.

English mining engineers commenced about ten years ago to apply fan-blowers to the ventilation of mines. The French had previously adopted the same practice. In addition to the economy of this method, the complete control which the attendant is enabled to maintain over the quantity of air supplied at all times, is found to be of great advantage.

To propel the air into the hall, therefore, I would employ four fan-blowers, having a capacity of 200,000 cubic feet per minute each. I would place these near the northern end of the large central chamber in the cellar, as shown in the plan of foundations, Plate I, and in the sectional elevations of the House wing, Plates II and III, attached to this report. Thence the air passes both east and west, as shown by the arrows, to the extreme ends of the building, where it passes up through shafts situated between the grand stairways and the outer walls to the chamber above the ceiling. Here I would provide an additional ceiling of plate glass and iron, of double thickness, that it might be a non-conductor of heat, and above this I would fix the gas-burners. This forms an air-duct, as shown by the sectional elevations, Plates II and III, of such a character that the air may be thoroughly distributed over the ceiling before passing into the hall. As the glass would be of the best quality of clear plate, it would be no perceptible obstruction to the light, while, as there would be six inches depth of confined air between the two thicknesses, neither the heat of the summer sun nor that of the numerous gas-lights would raise the temperature of the inflowing air; and in winter it would equally protect the warmth which had been previously given to it. Openings through the present ceiling would be provided, such that its present ornamental appearance would not be changed, and an equal area of opening would be obtained in each of the 165 squares into which it is divided.

To insure the continuance of the air thus admitted through the ceiling in a direct vertical line down to the floor and to the galleries, frequent openings throughout their extent, which should communicate to the air-chamber beneath the floor, would be provided, as shown in Plates II and III, especial means being provided to prevent the foul air from the galleries from flowing down upon the members on the floor; and from these I would withdraw the air by means of four fan-blowers of equal dimensions with those employed to drive the air in, but I would drive them only three-fourths the velocity given the others, as the air which ventilated the committee rooms, though supplied from the same source, would not pass through these. These blowers are shown at the ends of the building in the illustrations. From them the air passes up through a separate duct, by the side of the pure air-duct already mentioned, back of the grand stairways, and goes off through the roof.

All these blowers would be driven by one pair of engines of 750 horse-power, through the medium of appropriate gearing, shafts, and belts, as shown in the plates. In every case of gearing there would be wooden teeth working into cut-metal gear, which, it is well known, may be made to run with perfect silence, and is more durable than metal gearing. By running all the blowers from one engine, a uniform relation of the forces employed in different localities is thoroughly secured under all circumstances.

It will thus be perceived that the air would be driven in through the ceiling and drawn out through the floor with equal forces, and that if the doors are left open into the corridors, either from the floor or from the galleries, there will be no tendency for the air to flow either into or out of the hall. At present the provision for the egress of the air through the ceiling is so much greater than that for forcing it up through the floor, that there is a constant flow into the hall from the corridors through every open door, both on the floor and in the galleries. (*Vide* the Hon. John Covode's report on the ventilation of the hall of the House of Representatives, made June 20, 1868, p. 2.)

If the forces employed to drive the air in through the ceiling were greatly in excess of those provided for drawing it out through the floor, and the doors were left open, the direction of the current would be changed from the direct vertical line to oblique ones toward the doors, and while those sitting near the walls might get their full share of pure air, those in the center of the floor would not.

Again, if the forces for withdrawing the air were greatly in excess of those for supplying it, the air would flow into the hall from the corriders through the open doors, disturbing the direction and equal distribution of the pure air, and interfering with whatever modifications there had been made in its condition as to warmth and moisture.

By the plan proposed, however, complete control is maintained over the direction and velocity of the entire mass of air which fills the hall.

Messrs. Shedd and Edson, in their report on ventilation to a committee of the Massachusetts house of representatives, dated January 1, 1865, remark in regard to this as follows:

"As regards the manner of applying the power to effect the change of air, it is sometimes applied to the exhaustion of the foul air, and sometimes to the supply of the fresh air. Either way is effectual in a degree, but neither alone accomplishes quite all

that is to be desired. Forcing the fresh air in abundantly will drive out the air already in the hall at every outlet, and it is essential for security against the intrusion of cold currents through cracks and doorways. But it will drive out mainly at the easiest outlets, and some of the most important may be neglected, because of being out of the easiest way for the air to pass. The only sure way to get the air out just where you want it to go out, is to apply an exhausting force at the outlets to guide and assist the expelling force. The filling method is called the plenum method, and the exhausting the vacuum method. Much has been said about the superiority, for working vigor, of air in a plenum, or over-pressure condition. There is no doubt of the fact that under a high atmospheric pressure a man has greater power than under a low pressure. But the amount of superior pressure that can be obtained in a common hall is very slight, and can hardly have a perceptible effect. A nearly even balance of the filling and exhausting forces, making the in-door barometer about the same as the out-door, but with the filling force enough in excess to keep out all air seeking to enter without leave, is the most economical and satisfactory condition to obtain."

PLACE OF OBTAINING THE AIR.

In the report of Senator Buckalew to the Senate from the Joint Select Committee on Ventilation, made February 20, 1865, he says:

"The air for ventilating the halls is now taken from the levels of the terraces, between the wings and the old Capitol building, on the western side. To these situations much dust and other impurities are carried by the action of the winds, subjected to the influence of eddies, and taken with the air through the ventilating passages into the halls. And in warm weather, the terraces and adjoining walls, becoming heated, affect very considerably the temperature of the air obtained. Reference upon this point of the inquiry is made to the testimony of Dr. Antisell, and Mr. Forney, the engineer in charge of the ventilation of the House of Representatives. It is manifest that the air introduced into the halls should be obtained from places not subject to the accumulation of impurities, or to the undue production of heat."

The architect of the Capitol extension, Mr. Edward Clark, in a report dated November 1, 1866, states:

"Objections have been made to the fresh air source. The present inlets are near the angles of the wings and connecting corridors, and are liable at all times to admit dust, and oftentimes do admit other impurities thrown from the windows. Besides, the air at this place has an increased temperature in summer, obtained from the reflection from the heated walls and pavement.

"In order to obtain a purer, and, in summer, a cooler supply of air, it is proposed to construct an underground duct, opening in the eastern grounds, which opening could be made an ornamental feature by placing a fountain in its center. The jets and overflow would assist in cooling the air and to rid it of any mechanical impurities with which it might be charged. A separate duct and fountain will be required for each wing."

Mr. Charles F. Anderson, an architect and civil engineer, in a report to the Joint Select Committee on Ventilation, &c., says that the present plan "receives the exterior air under the ground floor from off the surface of the overheated and dusty terraces, furnishing much of the bad air from beneath, carried to its surface by evaporation and side currents of air from the ground; and this air is also tainted with much of the odors caused by the machinery near which it passes."

This gentleman proposed the erection of high towers to serve as openings to the inlet ducts, but as it is well known that the dust on a windy day rises as high as the top of the dome, these would not be an efficient remedy.

I would propose a modification of the plan of Mr. Clark, the architect, as already quoted from his report.

I would place the mouth of the tunnel in the western instead of the eastern park, partly because it is nearer, but more because the prevailing winds are from that direction, and the foulness from all the horses, which are numerous in the vicinity of the eastern park, would be avoided.

At a distance of 194 feet from the western front of the House wing there is a beautiful spot, completely canopied with the boughs of ten or twelve trees, which stand in a circle of about 50 feet in diameter. In the center of this circle I would make an opening 25 feet diameter and 24 feet deep. Over this I would erect a substantial wire screen, 25 feet diameter at the base by 22 feet in height, and similar in form to the Capitol dome. It would be made of quarter-inch wire, of pure block tin, that it might be durable, and always clean and healthy. The meshes would be of about 1¼ inches. Over the top of this there would be a revolving fountain with four jets, each of which would project downward in an oblique direction, and throw a small stream of water with force upon the wire work of the screen.

It will be readily understood that this arrangement would keep every wire covered with an envelope of clean water, against which the entering air would have to rub in

passing in. This forcible contact would transfer the dust from the air to the water. The muddy water would fall to the bottom of the duct and pass away by the drain through an appropriate trap.

From the bottom of this vertical opening a tunnel would extend horizontally to beneath the blowers in the center of the cellar; and these blowers are so inclosed as to draw their air wholly from this source. The tunnel is 15 feet in diameter, and the top of it passes 16 feet below the lowest point of the foundations of the building. Its horizontal length would be about 300 feet. The entire tunnel would be lined with brick and cemented in the most substantial manner. Around the inlet screen there would be a granite coping and marble curb, to correspond with the fountains in the same park, except that the curb would be 4½ feet high, in order that the air drawn in should come from an upward direction. This arrangement is clearly shown in Plate IV. The valve for supplying the fountain would be situated in the engine-room.

Thus the air would be drawn down through the foliage of the trees into a clean passage, coming in contact afterward with nothing which could vitiate its purity until it had performed its functions of ventilation.

II. WARMING AND MOISTENING THE AIR IN COLD WEATHER.

There are three methods in common use for warming the air of ventilation in buildings: 1st, by passing it over iron surfaces which are heated directly with fire and the products of combustion; 2d, by passing it over iron pipes filled with steam; and 3d, by passing it over iron pipes filled with hot water. The first of these methods is considered as so highly objectionable as to be entirely discarded in first-class buildings. When air is brought in contact with highly heated iron surfaces, an unpleasant odor is given to it, so that people say it is burnt, and there is a general belief that it is very unhealthy air to breathe.

The employment of steam pipes is regarded as an amelioration of the above difficulty, as their temperature is not so elevated; and hot water is used in preference to steam in order more fully to secure the same end.

In the examination of Mr. Goldsworth Gurney before a committee of the British House of Commons, March 31, 1854, he testified as follows upon this point:

"Question 31. Do you think that the offensive smell may arise in any degree from the use of metal pipes? There is sometimes what is called a 'ferruginous odor' produced from iron pipes, but I believe not much in the present case; burnt air is the great source—the decomposition of small particles of animal matter which always float about in the amosphere. This question has been settled by French philosophers many years ago; it is not from the decomposition of the nitrogen and oxygen, but from the decomposition of those ammoniacal matters which are always found more or less in the atmosphere.

"Question 32. Would you be disposed to recommend any other material than iron for the warming pipes? I should prefer zinc; it is clean, a good conductor, and radiates heat well."

My own opinion is that the rusty surface of the iron imparts most of the offensiveness experienced, and that, therefore, the term "ferruginous odor" is correct, and as it is impossible to employ iron pipes for this purpose without their surfaces soon becoming rusty, the true remedy is to supply a more cleanly metal, as recommended by Mr. Gurney. That gentleman afterward, in rearranging the ventilating apparatus of the houses of Parliament, employed surfaces of sheet zinc heated with hot water. The improvement in cleanliness by exchanging zinc warming surfaces for iron was very great, but an equal improvement over the zinc surfaces can be made by the employment of pure block-tin tubes. This is superior to all the useful metals in its power to resist atmospheric influences. In this respect, indeed, it is fully equal to silver. It is a good conductor of heat; and though its bright surface would prevent its radiating heat well, as claimed by Mr. Gurney for zinc, this is unimportant, as air is not warmed by the heat of radiation, but only by direct contact with bodies warmer than itself.

Recent improvements in the mechanic arts have brought tin-encased lead pipe and solid block-tin pipe largely into use for conveying water in dwellings; its cleanliness and healthfulness strongly recommending it.

I would therefore employ pure block-tin tubes, filled with hot water, for warming the air. This would not only warm the air without imparting any odor whatever to it when the apparatus was new, but would continue to do so for a great many years after zinc had become entirely coated with its oxide, or iron had rusted through and through and been many times renewed.

In Plates I and II of the illustrations there will be observed five congeries of tubes in each of the two great air-ducts in the foundation story. These marked *h* are for warming the air. Each tube is 10 feet long by 1⅛ inches outside diameter; they are secured into brass tube-heads in the same manner as in the surface condenser of a marine engine. They open at each end into steam-tight chambers, or chests. Into the upper of these I would introduce steam from the boilers; and from the lower I

would draw off the water by appropriate pipes, the valves of which would be situated in the engine-room.

It will be understood that with this arrangement the apparatus would be a steam heater, if the extent of the tubular surface was limited to the amount necessary to warm the air by the condensation of the steam only, but that if the surface is enlarged to the amount required to warm the air with hot water, the steam will be condensed in the upper chambers and the upper ends of the tubes, hot water filling the remainder of the tubes and the lower chambers. A valve in the pipe through which the water flows away would control the rapidity with which it was drawn off and consequently its temperature. In ordinarily cold weather this would be hot-water warming apparatus, but upon any extremely cold day it would become a steam-heating apparatus as the attendant opened the regulating valve in the drain pipe.

To decide upon the amount of warming tube-surface necessary, it is first requisite to consider the subject of

MOISTENING THE AIR.

Water pervades the entire human system; considered mechanically, it performs the functions of a lubricant to all its parts. The ligaments and muscles move freely in their places because every fiber of them is coated with water. The skin and hair are soft and pliable for the same reason. In all mechanism the lubricant must be constantly renewed, as the surfaces it lubricates are always wearing away, the particles worn off being absorbed by the lubricant and flowing away with it. In the case of the human body we find the lubricating water, the supply of which is kept up by our daily food and drink, working its way gradually to the surface through the skin and lungs to the air, where it arrives loaded with worn-out particles of our animal nature, and into which it evaporates.

Now the rapidity with which water of a given temperature will evaporate into air in a state of rest is dependent entirely upon how far the condition of the air in regard to moisture is removed from the point of saturation. And in the case of the evaporation from our bodies, if it is too rapid, the skin becomes too dry, and this again induces too rapid a flow of the water within the system toward the surface, making us uncomfortable, and sometimes ill.

Again: the process of evaporation is a cooling one to the surface from which the evaporation takes place. This is explained by the absorption of the latent heat which occurres upon the conversion of a liquid into a vapor. When, therefore, the evaporation is too rapid we are uncomfortably cold, even though the temperature of the air may be sufficiently high.

On the other hand, if the evaporation is too sluggish, the flow of water toward the surface is retarded, and we are made uncomfortable and sometimes ill in another way; also, if the air is of the proper temperature we are uncomfortably warm, the general feeling being described by the term "muggy."

It is highly important, therefore, that the condition of the air as to moisture should be maintained, in any system of ventilation, at that which is the most comfortable and healthful; indeed, that which is the most comfortable is the most healthful.

Most writers upon the subject of the ventilation of large assemblages say that it is impossible to adjust the condition of the air so that all will be comfortable. That persons whose blood has become thinned by age or illness, or who are naturally thin and cool-blooded, require a higher temperature than those who are young, strong, and full-blooded. Also, that in an assemblage where, as in this case, the same person sometimes sits during the entire session of the day without moving or speaking, and at others exerts himself strenuously in a vigorous speech, he is either too cold or too warm, accordingly as he sits still or exerts himself.

My observations and studies upon this subject, however, lead me to the conclusion that if the degrees of heat and moisture are both properly tempered, *i. e.*, each brought to the average of the most comfortable for all, there will be no complaint. The aged and feeble may feel cooler than the young and strong, but they will be comfortably, not uncomfortably cool. Also, when a member sits quietly in his seat all day he will be cooler than when he exercises, but then it will be a comfortable coolness; and when he has greatly exerted himself in an extended speech, in which his deep interest may have led him to become excited, although he will feel warm, it will not be an uncomfortable warmth. Indeed, the question is not whether persons feel warm or cool, but whether they are comfortably or uncomfortably so.

As a general rule, the only point which receives proper attention in the ventilation of large assemblages is that of the temperature. The air is almost always too moist or too dry—generally the latter in cool weather, even if pure—so that the degree of comfort experienced by each is dependent upon his strength and health. It does not hurt a young, strong, healthy person so much to draw the water out of him too rapidly or too sluggishly as it does an old, feeble, or sick person. But the health and strength of the most vigorous man is gradually undermined by any extended persistence in living

in air which has either a great excess or deficiency of moisture, and one of the great difficulties about it is, that in nine cases out of ten he does not know why his health has failed.

I would, therefore, provide for controlling the amount of moisture in the air so that the exact degree of it desired should be maintained with the same precision as the temperature.

The eminent Professor Henry, of the Smithsonian Institution, in a report on the warming and ventilating the Capitol, dated May 4, 1866, remarks upon this point:

"It is evident that the great object of warming and ventilating an apartment in the winter season is to supply it with pure air of the same degree of temperature and the same amount of moisture as that of an open space in a pleasant time in summer. To fully attain this object is a very difficult matter, but that system of warming and ventilation is certainly the best which approximates the nearest to this desirable condition. The heating of the air and preserving it at the desired temperature is the simplest part of the problem; to remove the impure air and to supply its place with fresh air without giving rise to unpleasant currents and unequal temperature is more difficult; to supply the proper quantity of moisture and to prevent its condensation is attended with still greater difficulty, particularly when apartments containing a large number of persons are to be thoroughly ventilated. This part of the general problem is, in my opinion, an essential element of proper ventilation, although it has hitherto received comparatively but little attention in this country.

"The idea is entertained by some that because the heating of a large volume of air to the required temperature of the room does not abstract the aqueous vapor which it contains, that hence evaporation from a surface of water is not required to render such air salubrious. It should, however, be recollected that when the external air is, say, at the temperature of zero, all of its aqueous vapor has been condensed, with the exception of an almost imperceptible quantity, and when this desiccated air is afterward heated to a temperature of 70°, its *capacity*, so to speak, for vapor, is so much increased that moisture exhales into it with great energy from all bodies from which it can be evaporated. A rapid current of ventilation of air in this condition constitutes an artificial sirocco. * * * It is true that the supply of the necessary amount of moisture will increase the cost of heating and ventilation, but this is a consideration which cannot, in most cases, be allowed to weigh against health and comfort."

From the report of Dr. Wetherill on the warming and ventilation of the Capitol, to which reference has already been made, I extract the following remarks:

"For an atmosphere which shall be salubrious to the inmates of an apartment, the hygrometric condition of the air is as important as its freedom from poisonous or deleterious gases.

* * * * * * *

"The evaporation of water from the body is intimately connected with health. The sudoriparous glands, which are constantly secreting their liquid, have a length of tubing which has been estimated at twenty-eight miles. The secretion takes place so gradually that the water ordinarily evaporates, as insensible perspiration, as soon as it reaches the exterior surface of the skin.

"During severe exercise, exposure to great heat, in some diseases, or when the evaporation is hindered by an impermeable covering, the secretion collects upon the exterior of the body in drops of sensible perspiration.

"The total average loss by the lungs and skin in twenty-four hours is almost 3½ pounds of water, of which somewhat more than two-thirds, say 2½ pounds, are furnished by the skin. Of these 2½ pounds only one-sixth is furnished by the vital process of secretion by the sweat glands; for the greater part of the moisture transudes through the skin by simple evaporation. The cutaneous and urinary excretions are, as is well known, vicarious. The evaporation from the skin regulates the animal heat, the body being in analogous condition to those porous earthen jars in which the inhabitants of tropical climates cool water by the evaporation of that portion which exudes to the surface of the vessel.

"The estimated loss of heat to the body by evaporation, per minute, is sufficient to raise half a pint of water from the freezing to the boiling temperature.

"For health, the body must evaporate a quantity of water within certain limits. The amount evaporated is influenced by the hygrometric condition of the air, and by the state of the body itself. The evaporation is increased by muscular action and by a dry atmosphere; it is diminished by repose and by a moist air.

"If the functions of the skin are interrupted, certain diseases are manifested. Among these are affections of the throat, catarrh—passing into acute bronchitis—pulmonary consumption, pericarditis, inflammation of the stomach and bowels, dyspepsia, rheumatism, gout, and fevers.

* * * * * * *

"The rapidity of the evaporation of the body depends *principally* upon the low rela-

tive humidity of the air at a high temperature, and upon the maintenance of this condition in the neighborhood of the body by the action of currents of air. Thus, with too great dryness of the air, particularly at an elevated temperature, and especially if it pass rapidly over the body, there will be a greater degree of evaporation than is consistent with health. On the other hand, in an atmosphere saturated with moisture, the evaporation from the body would be reduced to a minimum, and would be practically nothing in such air having the same temperature as the body. Although we may bear with impunity these extremes for a short period, a persistence in such conditions would be fraught with danger.

* * * * * * *

"It is certain that the hydration of the air will involve, in the winter, a considerable expenditure of fuel for a powerful ventilation; but the hydration is as necessary to health and comfort as the warmth."

Dr. Youmans, in his Handbook of Social Science, page 308, says:

"Air changed in temperature by warming, without increased moisture, is apt to produce unpleasant feelings and painful sensations in the chest, which are often attributed to too great heat. In very dry air the insensible perspiration will be increased, &c. The objection lies against *heated* air, no matter how heated. Stoves and air furnaces, with their red-hot surfaces, are undoubtedly worse for the air than hot-water apparatus, which never scorch it; yet the latter may pour into our apartments a withering blast of air at 150°, which may be potent for mischief. The only way that hot air can be made healthful and desirable is by an effectual plan of artificial evaporation."

In the report of Senator Buckalew, to which I have before alluded, he says, page 4:

"It follows that the dry and warmed air for supplying rooms of great magnitude must be passed over an evaporating surface of great extent, in case that mode of hydrating it be adopted. Doubtless warming the water would increase the efficiency of the plan. Dr. Antisell recommends spray, or jets of water, thrown into the air at a right angle to its current, which would, no doubt, be an effective and satisfactory mode of accomplishing the object where the necessary facilities can be established, among which space is indispensable. The objections to the use of steam on an extensive scale for hydration are the production of noise, and, as alleged, of odor, and its imperfect dissolution in the air before entering the chamber. It passes on with the current of air for some time before it becomes dissolved and incorporated with it, and moisture is deposited upon all surfaces with which the volume of air comes in contact. There is no arrangement for introducing steam into the air passing to the halls, but it was provided for the air directed to the committee rooms and passages. The plan was not found to work well, and has not been in practice."

Mr. Lewis W. Leeds, the consulting engineer of ventilation and heating for United States Treasury Department, &c., in a report to the Hon. John Covode, on the ventilation of the House of Representatives, dated January 13, 1868, says upon this point:

"There seems to be an entire unanimity among all parties as to the necessity for additional moisture. This I think of much importance. I however doubt the propriety of allowing the steam to be discharged directly into the fresh-air chambers. There is often an unpleasant smell from escaping steam, and more frequently from the air driven from steam pipes as the steam enters."

The plan I would propose for moistening the air is, to place in the air-ducts in the cellar, just beyond the heating pipes, a system of water pipes, as shown at *m m* in Plates I, II, and V. It will be observed that there are ten pipes, each 20 feet long, lying horizontally, lengthwise of the duct, and distributed throughout its cross-section so as to equally divide it up. In each of these ten pipes there would be a great number of minute holes extending all around the circumference and throughout the length of the pipe. The water driven into these pipes with force would spin out of these holes radially from each pipe, filling the entire duct with a fine shower. The air passing through this shower would be moistened, and a valve in the engine-room, regulating the force with which the water was driven into the pipes, would determine the degree of moisture at which the air should be delivered into the hall.

There are several methods in common use for designating the degree of moisture of the air, viz:

1. The number of grains in weight of water per cubic foot of air.
2. The tension of the vapor in height of a mercurial column.
3. The depth of water there would be on the ground if all the vapor in the air should be suddenly condensed and fall.
4. The "break," or difference between the wet and dry bulb thermometers.
5. The temperature of the "dew-point."
6. The "relative humidity," or per centum which the amount of moisture in the air is of that necessary to saturate it at the same temperature.

The last of these is the most popular method, because it appears to be the general

opinion that this expression should be uniform for all temperatures, to render the air comfortable and healthy to live in. There does not, however, appear to have been any very exact determination of what this should be; but with a temperature of 65°, a strong, healthy person is not uncomfortable when it ranges above 50 and below 80; but in the course of some careful observations of the effect upon delicate persons in feeble health, I have found them commence to complain when it went as low as 60, and again when it went up to 70; the complaint being, however, that it was too cool with the former degree of moisture, and too warm with the latter, although the dry-bulb thermometer continued at 65°. With a temperature of 65° and a relative humidity of 65°, however, I have heard no complaints; and I find that, personally, I can sit quiet or exercise in air of that condition with great comfort, with indoor winter clothing.

With the entire ventilating apparatus arranged as I would propose, these points can be fixed upon, and afterward maintained as may be found desirable by experience; but I will assume the above temperature and degree of moisture as the base of my calculations for the amount of surface required for the warming tubes.

A relative humidity of 65° with a temperature of 65° corresponds with—

$4\frac{1}{2}$ grains of water per cubic foot of air,
A tension of $\frac{4}{10}$ of an inch of mercury,
A depth of $5\frac{1}{2}$ inches of water on the earth,
A break between the wet and dry bulb thermometers of $5\frac{1}{2}$°, and
A dew-point of 52°.

To exhibit the increased capacity of the air for dissolving the vapor of water, as its temperature is elevated, the following table is extracted from one by Guyot, quoted by Dr. Wetherill in his report:

Temperature of air.	Vapor in grains per cubic foot.	Temperature of air.	Vapor in grains per cubic foot.
0°	0.545	55°	4.860
5	0.678	60	5.756
10	0.841	65	6.795
20	1.298	70	7.992
30	1.968	75	9.372
32	2.126	80	10.949
40	2.862	85	12.756
45	3.426	90	14.810
50	4.089	95	17.145

The temperature of the external air in Washington is so seldom below 20°, even in cold winters, that I would limit the surface of the warming tubes to an ability to warm the air entirely with hot water from that degree of coldness, and for colder weather would allow it to become a steam-heating instead of a water-heating apparatus, as already explained.

The lowest degree of humidity of the external air reported by Dr. Wetherill, as found in his experiments, was 1.11 grains per cubic foot. I will assume one grain for the base of calculation. There will then have to be added $3\frac{1}{2}$ grains per cubic foot to give it a relative humidity of 65 when at a temperature of 65°, and as there are 7,000 troy grains in one pound avoirdupois, 80,000 cubic feet of air will require—

$$\frac{80000 \times 3\frac{1}{2}}{7000} = 40 \text{ pounds of water per minute.}$$

The temperature of the water would probably be about 40°. This would have to be warmed up to a temperature of 65°, and be supplied in addition with the latent heat necessary to form it into vapor at that temperature.

To ascertain how much the air must be superheated for this purpose—

Let s = specific heat of air as compared with water = 0.2669
v = volume of air in cubic feet..... = 80,000
w = weight of air in pounds per cubic feet.... = 0.075
t = temperature from which water is raised.... = 40°
t' = temperature to which water is raised..... = 65°
l = latent heat of steam at that temperature.. = 1070°
W = weight of water to be absorbed in pounds. = 40
x = number of degrees the air must be heated above 65°, in order that it may be at that temperature after it has dissolved the moisture.

Then,

$$\frac{W\ (l + t' - t)}{s\ v\ w} = x = 27°.$$

The temperature to which the air must be raised under the above conditions of the weather before it is moistened would, therefore, be—

$$65° + 27° = 92°.$$

Now, to determine the extent of surface required for the warming tubes—

Let P = temperature of water in tubes.. = 192°
T = temperature of air after heating = 92°
t = temperature of external air.... = 20°
C = volume of air in cubic feet..... = 80,000
S = surface of tubes in square feet.

Then,

$$.0045\ C\ \frac{(P-t)\quad (T-t)}{P-T} = S;\ \text{and}\ S = 44{,}582\ \text{square feet.}$$

Each tube, being 10 feet long by 1⅛ inches diameter, would have a surface of 2.9 square feet. There would, therefore, be required 15,373 tubes. I have divided them into eight several congeries for convenience of construction, with 1,922 tubes in each.

In some seasons of the year there will be days when the external air will be all right as to the temperature, but will be deficient in moisture. In such event both the heating and moistening apparatus would have to be employed, as we have seen in the foregoing that the operation of moistening the air is a cooling one. When, however, the heat is a little in excess and the moisture correspondingly deficient, the moistening apparatus would serve both as a cooler and hydrator, and it is only when the weather happens to be in that exact state that the very prevalent idea that the air may be cooled by jets of water is applicable. When the air is too moist as well as too warm, such jets would add greatly to the discomfort experienced. When the relative humidity is in excess in the external air and the temperature too low, merely heating the air may correct both difficulties. I would arrange indicators in the engine-room, such that the engineer would be able to see, at all times, the exact condition of the air in the hall as to temperature and moisture; and then I would so arrange the controlling valves of the entire apparatus that as he looked at the indications he could add or remove moisture, elevate or depress the temperature at will and at once.

When a person enters a building on a cold day in winter, especially if he has been riding, he will invariably repair to a fire to warm himself, if there is one. The most grateful fire one can enjoy, under such circumstances, is one that presents a clear, cheerful blaze. Good dry hickory wood in an open fireplace, having burned long enough to be in a glowing state of combustion throughout, is, I believe, every one's *beau ideal* of a pleasant fire. Such fires might be supplied to the cloak-rooms, but the objection to them would be the constant attention they would require to keep them always in full blaze. Anything less than that would be unsatisfactory, as, if a member came in nearly frozen he would get warm by the general warmth of the hall before a fresh fire could be brought to the necessary heat-giving condition.

The gas fireplaces which have been introduced into the residences of some of the wealthier citizens of New York, within the past two years, fulfill all the requirements of the case in the most complete and elegant manner. When not required, the gas can be turned down to an ignition blaze, and the moment any one or more persons wish to enjoy an especial warmth, they have only to turn on the gas, when there instantly occurs the most efficient and cheerful fire it is possible to imagine.

I would place two of these in each of the four cloak-rooms.

III. COOLING AND DRYING THE AIR IN HOT WEATHER.

To reduce the temperature and moisture of the air of ventilation in the hot weather in summer is a much more expensive operation than warming and moistening it in cold weather. But, in the warm climate of Washington, the midsummer session is always dreaded by members of Congress. During the hot season of last July, the House adjourned on two different occasions at an exceptionally early hour, because it was beyond the limits of physical endurance for the reporters to continue their labors longer in the fervid heat. Members were compelled to frequently leave their places and seek temporary relief in some breezy window. Some members, indeed, refrained entirely from appearing in their seats on those hot days. Of course the oppression was much increased by the impurity of the air, owing to the faulty ventilation; but there can be no doubt that the comfort and health of the members can be greatly improved by cooling the air when it is so excessively hot, though it be pure and plentiful; and that those composing so important a body as the House of Representatives should not be made uncomfortable and ill to an extent which every one recognizes as seriously interfering with the business they meet to perform, will, I think, be evident to all; even though the expense of reducing the temperature be greater than it has heretofore been customary to incur for any ventilating process.

Some attempts have already been made in this direction, but, like all the features of

the present system, the means employed were entirely inadequate to accomplish the end proposed. Thus, 2 tons of ice were melted in the air-duct leading to the hall during each day of about 5 hours, say 800 pounds per hour. The quantity of air passing through the duct, with the blowing-engine running at its usual speed of 42 revolutions per minute, as carefully measured by myself, was 24,300 cubic feet.

The temperature of the ice was, say ..... 25°
That of the water of condensation was, say ..... 60°
The latent heat of ice is ..... 140°

To determine how much the air would be cooled by melting the ice—

Let t = temperature of the ice ..... = 25°
t' = temperature of the water of condensation ..... = 60°
l = latent heat of ice ..... = 140°
s = specific heat of air ..... = 0.2669
w = weight of air per cubic foot ..... = 0.075
v = volume of air in cubic feet ..... = 24,300
W = weight of ice melted per minute ..... = $13\frac{1}{3}$
x = number of degrees the air would be cooled by the melting of the ice.

Then,

$$\frac{W\,(l+t'-t)}{s\,w\,v} = x = 4\tfrac{3}{4}°$$

As, however, the air thrown in by the present blower is mixed up with that which flows into the hall through the open doors, the temperature of the hall is only reduced about one degree by the melting ice.

The greatest absolute amount of moisture Dr. Wetherill found in the air at the Capitol, in his experiments, was 8.93 grains per cubic foot; and this was during the prevalence of a rain-storm.

The temperature seldom rises above 95°, but it reaches that point often enough to establish the propriety of assuming that as the maximum.

If now we suppose the temperature to be 95°, and the moisture in the air at 9 grains per cubic foot, and we wish to reduce the temperature to 75°, and not permit the relative humidity to rise above 65, we must abstract three grains of water from each cubic foot, or—

$$\frac{80{,}000 \times 3}{7{,}000} = 34.3 \text{ pounds from the whole quantity per minute.}$$

At the moment of the condensation of this water from a vapor into a liquid, its latent heat is given out into the air; so that removing the vapor is a warming process, as has already been shown that the addition of it is a cooling one.

The additional extent which the air must be cooled to compensate for this latent heat of the vapor is expressed by the formula—

$$x = \frac{W\ l}{s\ v\ w}$$

Where W = the weight of water in pounds ..... = 34.3
l = latent heat of the vapor ..... = 1091°
s = specific heat of air ..... = 0.2669
v = volume of air in cubic feet ..... = 80,000
w = weight of air per cubic foot ..... = 0.075
x = the number of degrees the air will be warmed by the condensation of the vapor.

With the above values,

$$x = 24°$$

The entire cooling effect must, therefore, be equivalent to 44°.

This would require 24,000 pounds of ice to be melted per hour, or, say, 60 tons per daily session of five hours.

Coal is cheaper than ice per ton, is more conveniently stored and handled, and *one-sixth* of the above quantity burned in the furnace of a steam-boiler will produce, through the medium of appropriate mechanism, an equal cooling effect upon the air. I would, therefore, discard the use of ice and employ steam-power instead.

Machines are operated by the steam-engine for the manufacture of ice, which produce cold by pumping off the vapor of sulphuric ether, or of the bisulphide of carbon; these liquids vaporizing rapidly at low temperatures if the pressure of the superincumbent atmosphere be removed, but the employment of such substances would be inadmissible in cooling the air for ventilation, as a slight leak in even one of the many tubes it is necessary to employ in such mechanism would impair the purity of the air to a decidedly sensible and objectionable extent.

I would, therefore, employ the steam-power to drive air-pumps to compress a portion of the air, making it hot, and while it was under this pressure cool it down to the ordinary temperature by passing it through tubes surrounded by flowing water; employing an apparatus for this purpose precisely like the surface-condenser of a steam-engine. This compressed air would then be conveyed to the duct through which the blowers were driving that which did not pass through the pumps, where it would be permitted to expand again to the ordinary atmospheric pressure. This expansion would be a cooling process exactly corresponding in extent to the heating one the air underwent when it was compressed; and by mixing this excessively cold air with the warm air from the blowers, the whole would be brought to the desired temperature.

It is mechanically convenient, in a machine of this kind, to compress two volumes of air into one in the pumps. To learn how much such an amount of compression would elevate the temperature, a formula is given by Peclét in his *Traité de La Chaleur, tome III, p.* 10, as follows:

Let θ = temperature before compression, (centigrade.)
d = density before compression.
θ' = temperature after compression.
d' = density after compression.

Then,

$$\theta' = (274 + \theta)\left(\frac{d'}{d}\right)^{0.42} - 274$$

In this case,

$\theta = 35°$ (= 95 Fahr.)
$d = 1$
$d' = 2$

and consequently,

$\theta' = 139.44°$ cent., or 283° Fahr.

and the elevation of the temperature would be 188° Fahr.

When air is heated in a confined space its pressure is increased $\frac{1}{480}$ part with each additional degree. The pressure of the atmosphere being 14.7 pounds per square inch, the pressure upon the pump pistons during the last half of the stroke would be,

$$14.7 + \left(\frac{188}{48} \times 14.7\right) = 20.46 \text{ pounds per square inch.}$$

Let us say that we will maintain a pressure in our condensed-air cooler of 20 pounds per square inch.

To find how cold the air will be after its expansion, we have—

$$\frac{\theta' + 274}{\left(\frac{d'}{d}\right)^{0.42}} - 274$$

The temperature of the Georgetown water during the hottest weather in summer is about 70°. As I would arrange the cooler so that there would be reverse currents of cold water and hot air, the latter would be cooled down to say 75°, which corresponds with 23.89° centigrade.

As the heat was abstracted from the air it would be further condensed $\frac{1}{480}$ part with the departure of each additional degree, the pressure being maintained; hence we would have—

$$\theta' = 23.89$$
$$d = 1$$
$$d' = \frac{14.7 + 20}{14.7} = 2.36$$

Whence,

$\theta = -66.12°$ cent., or —87° Fahr.

This would be a reduction from its original temperature of 182°.

This being slightly more than four times the amount of cooling force, it is necessary to apply to the whole quantity of air furnished one-fourth of that amount, or 20,000 cubic feet will require to be passed through the pumps.

Allowing 10 per centum for loss, the dimensions of the air-pumps will require to be as follows:

Number of pumps	2
Diameter of pistons	65 inches.
Stroke of pistons	6 feet.
Double strokes per minute	40

As the mean resisting pressure will be 12.4 pounds per square inch, the net power required to work them will be 1,200 horses. Allowing 10 per cent. for friction of engine and pumps, and we have 1,320 horses as the gross effective power of the engines. I would attach the steam and pump pistons to the same rods; with this arrangement, the steam-cylinders would have to be 45 inches diameter. I would employ a steam pressure of 40 pounds per square inch, and cut off at one-fourth from the commencement. A surface condenser would be attached, and the mean gross effective steam pressure would be 29 pounds per square inch. This cooling engine is shown in Plates I, II, and III of the illustrations.

If the cold air was simply conveyed to the air-duct and mixed with the warm air from the blowers, it would be cooled down below the desired temperature, and a portion of the moisture it is desirable to abstract would be condensed in the form of a fog and carried along with the air into the hall, which would thus be filled with a cold, damp air, highly objectionable. It is necessary, therefore, to have the cold air introduced in a peculiar manner, such that not only may the moisture be abstracted, but that the exact amount removed may be subject of convenient and easy regulation by the engineer in the engine-room. The character of this regulation must necessarily be that the power exerted by the engine shall determine the extent of the cooling force, and that the amount of this which shall be devoted to reducing the temperature of the air, and that which is devoted to abstracting the moisture, shall be subject to a regulating lever, or hand-wheel; so that if the engineer moves this in one direction the air will be made cooler and more moist, and if in the other it is made warmer and drier, the cooling engine continuing to run at the same rate.

To accomplish this, I would erect in each of the two cooling and drying chambers of the air-ducts a congeries of tubes somewhat similar to those employed for warming the air in cold weather, (marked *d* in the illustrations;) only I would have an additional chamber, or chest, at mid-height, so that there would be, in fact, two systems of tubes, one above the other; in other words, it would be two stories high. Now, in the two upper chambers I would have openings in the bottom in all the spaces between the rows of tubes; these openings controlled by valves, and the valves appropriately connected with hand-levers or wheels in the engine-room; there being one for a system of valves which would control the openings in every third space between the rows, and one for those in the remaining spaces. The aggregate area of the openings in the lesser system should equal the area of the pipe which brings the compressed air from the cooling engine; those in the other spaces, being of the same dimensions, would have in the aggregate twice this area. Then the compressed air should be conveyed by a pipe from the cooling engine to the lowest chamber; thence it would flow upward through the tubes into the upper chambers, then downward through the openings into the spaces between the tubes. The operation of this arrangement would be as follows:

Let us imagine a condition of the external air such as has been assumed for a maximum performance of the cooling engine. In this case let the openings in two-thirds of the spaces betweeen the tubes be closed, and those in the remaining spaces be wide open; the area of the whole being such that it would require a pressure of 20 pounds per square inch to drive all the air supplied by the pumps through them. It will be perceived that the pressure throughout, from the pumps to the exit, will be 20 pounds per square inch, and that, therefore, the temperature will be maintained at 75° while the air passes through the tubes. As the compressed air pours down between the two rows of tubes and expands to the ordinary atmospheric pressure, its temperature will fall so suddenly that the moisture within it will be condensed and part of it frozen into minute hail. The main portion of the air from the blowers will pass through the remaining spaces between the tubes; and as they are only one-eighth of an inch apart in the rows, they form, in effect, walls of separation between the warm and the cold air. A sufficient quantity of the air from the blowers will, however, pass into the cooled spaces to carry forward the hail-storm raging there, and as the hail and condensed moisture are carried along the narrow spaces they will come in contact with the surfaces of the tubes and be deposited upon them. The temperature of these will be too low to vaporize the moisture, but warm enough to melt the hail, and the water will run down them, as it does along the sides of an ice-water pitcher, to the bottom tube-sheet, whence it will pass off in proper drains prepared for it.

If the warm air issued from the drier with the same velocity as the cold, exactly one-third of the whole amount would be excessively cooled, and nearly all its moisture extracted; but the great velocity with which the compressed air will pour into the spaces between the tubes, having only to be changed in its direction by the horizontal current from the blowers, will flow out with considerably greater velocity than the warm air from the remaining spaces; so that something more than one-third of the moisture contained in the whole amount of air will be deposited upon the tubes and carried away. In the case under consideration, exactly one-third is the amount it is desired to extract. The necessary reduction will be made by slightly opening the valves in the remaining spaces; the immediate effect of which will be to cool down all the tubes by causing a partial expansion of the air within them, so that the warm air

will be cooled somewhat by coming in contact with the tubes, in addition to having some of the cold air mixed with it. This will lessen the extent to which the temperature will be reduced in the cold spaces, and, consequently, the amount of moisture which will be condensed and extracted.

If all the valves be fully opened, the air would, in this case, be delivered from the drier at a temperature of about 67°, and a relative humidity of 100°; the air would feel very cold and damp, but there would be no mist or fog, as all condensed moisture would be deposited upon the cold tubes, and the exact degree of humidity desired could be obtained by adjusting these valves; opening them would moisten and cool the air; closing them would dry and warm it.

When the cooling engine was not required to run at its full force, the first set of valves would require to be partially closed, when it was necessary to produce a large drying and a small cooling effect.

As the air issues from the drier it will be in vertical strata of cold dry and warm moist air, in the proper proportions, both with regard to temperature and moisture, to give the desired condition when they are mixed, which they will soon become as they pass along the duct.

When, however, the external air is of the right temperature, or not much above it, but is so damp that it must be dried, the resulting temperature of the mixture will be too low; in which event it must be warmed up to the desired point as it passes through the heater.

On the other hand, the external air may be so dry that when it is cooled down to the desired temperature it will still be too dry; when this occurs the moistening apparatus must be put in operation. Indeed, as has already been explained, it will sometimes happen that moistening the air will sufficiently cool it.

To enable the engineer in charge to control the condition of the air he delivered to the hall, I would arrange pipes about three inches in diameter and properly incased with a non-conductor of heat, from the inlet duct, from the tempering ducts just beyond the moisteners, and from the hall; leading them through a convenient place in the engine-room for observation to the suction openings in the blowers, which would cause a rapid flow of air through them, having the exact condition existing at the other ends of the pipes. Into each of these pipes, as they pass through the engine-room, I would insert the wet and dry bulbs of a hygroscope, which should plainly indicate the temperature and degree of moisture in the air passing through the pipes.

The method here recommended for drying the air when it is too moist, or when it is made so by reducing its temperature, is simply the adoption upon a small but sufficient scale of that employed by nature in effecting similar changes of weather.

Dr. Metcalf, in his incomparable work on caloric, vol. i, p. 267, and following, describes and explains the influences exerted by the vapor of water upon the atmosphere, and how it is added and removed. I quote from him as follows:

"As the phenomena of lightning have been universally known to be immediately connected with the production of rain, it becomes necessary to ascertain with certainty the cause of evaporation and condensation before attempting to solve the problem of atmospheric electricity.

"That caloric is the true and only cause of evaporation, or the formation of steam, is one of those self-evident propositions which would seem to require no proof. But to remove all doubts upon the subject the fact has been experimentally demonstrated by Dr. Dalton, to whom the science of chemistry and meteorology is so largely indebted.

"He put a little water in a dry glass flask with a thermometer in it, when he found that a small quantity of vapor was formed at 32° Fahrenheit. At 40° the amount was increased; at 50° it contained still more vapor; while at 60° the quantity was yet further augmented. He also found that when the temperature of the flask was suddenly reduced from 60° to 40° a portion of the vapor was converted into water, and that the quantity retaining the elastic form was precisely the same as when the temperature was originally at 40°.

"The above is a simple and beautiful representation of what is perpetually going on throughout the atmosphere and in the steam-engine.

"By another series of admirable experiments he ascertained that the quantity of water evaporated in a given time was exactly in proportion to the elastic force of vapor at the same temperature, whether formed in *vacuo* or under the pressure of the atmosphere, with this difference, that in the latter case the process goes on much more slowly because the atmosphere presents a mechanical impediment to its diffusion somewhat analogous to the obstruction of water by porous sand. From which he inferred that vapor is not chemically united with the air, as has been formerly supposed, but mechanically diffused through it, forming a distinct atmosphere of its own, the elastic force of which is always in proportion to temperature.

"At 0° he found the elastic force of vapor equal to the pressure .064 inch of mercury, that is, about one-fifteenth of an inch; at 32° it amounted to one-fifth of an inch; at 47° about one-third of an inch, or .339; at 59° .507, or one-half an inch; at 80° one inch; and at 90° 1.360. He also ascertained that the elastic force of vapor at 212° is equal

to the pressure of the whole atmosphere, or 30 inches of mercury. (Manchester Memoirs, vol. 5.)

"From the above experiments it follows that if the temperature of the earth were 80° from the equator to the poles, the quantity of vapor would be everywhere the same, and equal to about one-thirtieth of the average weight of the whole atmosphere; but that if its temperature were reduced from 80° to 59°, one-half of the vapor would be precipitated in the form of rain; if to 32°, four-fifths of it would be converted into snow; and if reduced to 0°, 14 out of 15 parts of the whole would descend to the earth in the form of ice, in obedience to that universal law of nature by which bodies cohere and tend toward a common center.

* * * * * *

"If at the temperature of 80° the atmosphere contains an amount of vapor equal to the pressure of only half an inch of mercury, while it is capable of sustaining twice that quantity, it will require a reduction of temperature below 59° to cause precipitation. Hence it is that the atmosphere often undergoes great reductions of temperature without producing rain. But when the air is full of vapor the process of evaporation is arrested; which explains why a cold, dry air is more favorable to evaporation than warm air that is already saturated, especially if the former be in a state of rapid motion.

"Dr. Dalton found that when boiling water was exposed to a current of air that carried off its vapor as fast as formed, vaporization went on a third faster than in a room where the air was still. Hence it is that the northeast and east winds, which in the west of Europe are generally dry, and far below the point of saturation, seldom condense the vapor of France and England; but, on the contrary, often re-dissolve the clouds already formed, producing clear weather. During summer, when the atmosphere has been for some time comparatively still, it is soon saturated with vapor, which is indicated by heavy dews and the formation of clouds termed *cumuli*, in which case the weather becomes hot and sultry, because the caloric which is usually carried off by evaporation and winds accumulates on the surface of the earth and heats the superincumbent air. Such a state of things generally forebodes an approaching thunder-storm.

"That the condensation of atmospheric vapor is owing to the abstraction of its caloric by colder currents of air is evident from the fact that in the tropical ocean, far from land, where the trade-wind blows steadily in one direction, and where the temperature seldom varies more than two or three degrees, there is less rain than in the vicinity of continents and large islands where currents of air of different temperatures frequently meet.

"In the great desert of Sahara there is scarcely any rain, because the wind blowing over it is generally in the same direction, while the vapor transported by it from the ocean is still further rarefied by the intense heat reflected from the scorching sands, where there are no mountains to arrest its progress. There are also long droughts in Egypt, Palestine, New Holland, and many other parts of the world, where the winds blow long in one direction without encountering colder currents. During summer in the United States the atmosphere is often so much heated that the vapor brought from the ocean by southern winds is not condensed for several weeks, and sometimes two months, but is further expanded, until it becomes saturated, or meets with a current from the northern points of the compass, when thunder-gusts follow.

"When I come to treat of winds it will be shown that the most extensive falls of rain in the middle latitudes are produced by the meeting of immense masses of air from opposite quarters of different temperatures, as during the equinoctial floods and storms. When both contain as much vapor as they can support at their respective temperatures, the amount of precipitation is of course the greatest.

* * * * * *

"There is nothing more admirable in the great drama of nature than the process of evaporation and condensation, by which all the waters of lakes, rivers, and fountains are elevated from the ocean, transported over continents and islands, precipitated by polar currents, and distributed in the form of great natural shower-baths over the dry land.

* * * * * *

"By a careful analysis of the phenomena, it becomes self-evident that, *if caloric be the true and only cause of evaporation, condensation and precipitation can be effected only by the evolution of the same agent.* During winter the quantity and elastic force of vapor in the atmosphere are comparatively low in the middle latitudes, where it is condensed gradually on meeting with colder air. During spring evaporation augments with increase of temperature, when masses of warm and cold air often meet, causing frequent showers of rain and sometimes of hail, still without much thunder and lightning. But during summer, when the temperature becomes tropical and the atmosphere saturated with highly elastic vapor, we have tremendous explosions of thunder and lightning, with rapid precipitations of rain and hail.

* * * * * *

"If it can be shown that transparent elastic vapor is the vehicle of atmospheric electricity, and that it is rapidly condensed during discharges of lightning, it will neces-

sarily follow that the caloric of such vapor is given out in the concentrated form of electricity during a thunder-storm.

* * * * * * *

"The fabled Proteus of old is but a feeble representation of the rapid changes through which caloric passes—now silently bearing the waters of the ocean aloft in the atmosphere in a state of transparent ethereal vapor; now darting vivid corruscations from its aerial palaces on high; leaping upon the mountains and cleaving the rocks asunder; resounding through the heavens with its great music, and sprinkling the earth with genial showers of fruitful rain. Though constantly changing, it is never destroyed, but is always the same powerful agent by which Infinite Wisdom directs and governs the universe. Who can refrain from sentiments of profound admiration of its God-like energy, and the wonderful manner in which it produces an endless succession of the most diversified effects?

"There is not a more striking evidence of beneficent design in the whole mechanism of creation than the rapid evolution of heat, from atmospheric vapor, in the concentrated form of lightning, during hot and sultry weather. Were it evolved gradually, as during winter, the number of rainy days would be so far increased as greatly to interfere with the operations of agriculture. On the other hand, being given out in the diffused form of sensible heat during the formation of clouds, rain, and snow in the higher latitudes, it moderates the excessive cold, which would otherwise prevail during winter."

It appears conclusive from the foregoing remarks of the learned writer, that the mechanical arrangement I have described, for cooling and drying the air when it is very hot and sultry, is only wanting in magnitude to produce a regular thunder-storm in the air-duct. The electricity will probabably be evolved in precisely the same manner that it is in the heavens when very cold and very warm currents of air are brought suddenly together, but it will be on so comparatively small a scale that the observable phenomena of the thunder-storm will not be apparent.

It is reasonable, however, to expect that the same pleasant effect would be had upon the air that a thunder-storm has, viz: to give it a peculiar freshness, as if it had been washed clean, and as if it possessed renewed vital powers, giving every one elastic spirits and additional life and strength.

Since the discovery of ozone by the late celebrated German chemist, Schoenbein, it is generally supposed that the electric fluid developed during thunder-storms gave that condition in considerable degree to the oxygen of the air, and that its delightful freshness and invigorating character, as experienced after a thunder-storm, were due to this cause, ozone being a condition of oxygen, which causes it to enter into chemical union with other substances with greatly increased avidity. When, therefore, we breathe air, of which the oxygen is in this condition, or which is impregnated with this principle, it unites with an increased readiness with the carbon and hydrogen which pass into it out of the blood, through the membranes of the lungs.

There is also good reason to believe that cooling the air by first compressing it, as I have recommended, will have the effect of developing ozone. Dr. Wetherill states in his report, to which I have several times alluded, page 91, that—

"M. Saint Pierre (Comptes-Rendus, lviii, 420, 1864) discovered a remarkable production of ozone by the action of certain kinds of ventilating apparatus. He found that test-paper, placed in the tuyere of a blast furnace, gave evidence of ozone in a much stronger manner than when in the external air; and to show that the velocity of the current bringing greater quantities of air to the paper was not the cause of the reaction, he placed, at the same time, similar papers upon the governor of a steam-engine in a saw-mill. From these and other experiments, he concludes that the reaction arises from compressing the air."

Whether this desirable condition of the air would be imparted to it by the mechanism described, or not, there can be no doubt but the temperature and moisture of the external air could be modified, by the system I have recommended, from its most unpleasant condition in any season of the year to that which is most delightful, and without imparting to it any impurities or unpleasant odors.

To supply the necessary quantity of steam to the blowing and cooling engines I would remove the present boilers and increase the available space in the boiler-room by removing the groined ceiling and the accompanying ribs from the side walls, and employ iron beams to support the pavement roof, all as shown in plate V of the illustrations. At present two chimneys, situated in the walls of the connecting corridor, are used to carry off the products of combustion from the boiler furnaces. There is a third one, not used at present, of which I would avail myself, and this would give a sufficient chimney area.

The aggregate potential dimensions of the four boilers would be as follows:

	Square feet.
Grate surface	300
Heating surface	13,744
Calorimeter through tubes	73
Calorimeter through chimneys	44

Height of chimneys above grate, 100 feet.

The maximum demand for boiler power will be when the cooling engine is in operation to its full power, requiring at such times a force of 1,320 horse-power. The blowing engines would then be running at their slowest rate, and would not consume more than 50 horse-power, making a total demand upon the boilers of 1,370 horse-power. It will be observed that the boilers would have 10 square feet of heating surface to each horse-power, a usual proportion.

COST.

I have carefully ascertained how much it will cost to carry out the foregoing programme, and although it amounts to a larger sum in the aggregate than I find contemplated in any of the various reports which have been made on this subject, it is very much less than was expended by the British House of Commons upon improving the ventilation of their hall, though it has the addition of the cooling and drying apparatus, the cost of which is a material addition to the expense; and, moreover, draws its air from an unobjectionable locality through a beautiful wire-work dome, which removes the dust, and then through a long underground tunnel; while the air for the House of Commons is drawn through the side windows of the basement story, which on one side overlook the court-yard where the carriages come for the members. The smell, as of an unclean stable, became so offensive that orders had to to be issued that horses should not stand there when waiting. On the other side the windows overlook the Thames, and orders had to be issued in this direction against the passage near the building of barges filled with offal. I do not know the exact amount they have expended, but the following extract from the evidence of the Hon. E. P. Bouverie, M. P., a member of the House committee on ventilation, before a committee of the House of Lords, May 12, 1854, will give an idea of it:

"Question 762. Do you not think that Mr. Gurney's improvement in the ventilation of the house is mainly attributable to the windows being open?

"Answer. I have heard it said that the result of our spending £200,000 in the ventilation of the House of Commons has been to prove that the best way of ventilating the room is by opening the windows. We sit in the house a good many hours after the windows are shut; for instance, we did so last night, and the air, I think, remains very fresh and good."

Here is an expenditure of $1,000,000 in gold, with labor and materials so much cheaper than in this country that it would require $2,000,000 of our present currency to effect the same work here now, and even then they had not arrived at a fully satisfactory condition of their hall, as they made several changes subsequent to the above date.

The whole cost of the Capitol building up to the present time is about $12,000,000, and it is correspondingly grand in its conception and beautiful in its details. The materials are of the highest order ever employed in building, and they are brought together with an exquisite taste and skill, which is probably unsurpassed in any edifice in the world.

The new wings are so arranged that mechanical ventilation is the only proper method, and that was adopted and is now in use. But the mechanism is utterly inadequate in its dimensions and power, is arranged upon erroneous principles, and is faulty in every detail of its design. It propels a feeble current of air up through the floor of the hall near the western end, which current continues directly upward and out through the ceiling without having done much to ventilate anybody. In winter it is heated by rusty iron steam-pipes, without being moistened, and in summer the little ventilation there is may be said to depend upon the open doors.

Such a system in such an edifice is simply disgraceful. How much honor is reflected upon the nation by imposing colonnaded façades of purest marble; by grand corridors with tesselated floors, bronze doors and frescoed walls; by the hall's great dimensions, or its gorgeous gildings and other ornamentations, if the whole is kept filled with a mephitic atmosphere by a defective and deficient ventilating mechanism?

The conception of the ventilation of such an edifice should be as complete and superior in its character as a scientific and mechanical work, as the building itself is as an architectural one.

The mechanism should be indebted for the principles which govern its arrangement and operation to a correct application of known physical laws. It should be scientifically proportioned throughout all its details, that it might correspond with the building and with the work it had to perform. Each part should represent the highest skill in the arts to which it pertains in its design, its materials, and its workmanship and finish.

In making the necessary examination of the building, with the view of preparing this report, I was greatly aided by the courtesy and assistance of the Architect of the Capitol Extension, Mr. Edward Clark, who gave me free access to all the plans and records of his office, and supplied me with much valuable information I would otherwise have been unable to obtain without great additional labor.

I am also indebted to the engineer in charge of the ventilation, Mr. J. Thomas Mil-

ler, and his assistant, Mr. H. F. Hayden, for assistance and information, rendered with the greatest cordiality.

I am, very respectfully, your obedient servant,

ALBAN C. STIMERS.

Hon. STEPHEN TABER,
Chairman Committee on Ventilation, House of Representatives.

Estimate of A. C. Stimers.

OFFICE OF ALBAN C. STIMERS, NAVAL ENGINEER,
No. 45 William Street, New York, December 15, 1868.

SIR: In accordance with the expressed desire of the committee in July last, that I should ascertain the net cost of executing the work of introducing a proper system of ventilation for the House wing of the United States Capitol, and report the same to you at this time, I beg leave very respectfully to submit the following detailed statement as the result of my investigations:

Excavating the inlet tunnel; bricking and cementing ditto; coping ditto with granite, and furnishing with marble curb, 28 feet internal diameter and 4½ feet high at inlet, and paving around the curb; block-tin wire screen dome at inlet, 25 feet diameter at base by 22 feet high, of ¼-inch wire and 1¼-inch mesh, with revolving fountain on top; and water pipe and sewer.	$103,103
Eight patent blowers, each having a capacity of driving 200,000 cubic feet of air per minute, including shafting, hangers, pulleys, &c., erected in place, complete	11,194
Pair of surface-condensing engines of 750 horse-power, with wood-gear fly-wheel; patent variable cut-off and steam-jacketed cylinders for driving blowers; all erected in place, complete	46,102
Removing masonry from the engine-room and tempering air-ducts, and replacing it with iron girders and columns; providing cut granite foundations for engines; opening and properly dividing the vertical air-ducts back of the grand stairways, and building inclosing walls between vertical air-ducts and main chamber over hall ceiling; and putting in stairs from basement to engine-room in cellar	70,994
Removing ceiling and ribs from boiler-room; removing present boilers; laying foundations for new boilers; providing new pavement roof with iron girder beams; enlarging smoke conduit from boilers to chimneys, and opening and topping out additional chimney	40,133
Four boilers and their appurtenances, having, in the aggregate, 300 square feet of grate surface, 13,744 square feet of heating surface, 73 square feet calorimeter through tubes, and capable of generating steam for 1,370 horse-power, and of sustaining a working pressure of 40 pounds per square inch, all set in place complete, and fitted with copper steam-pipes to engines	63,416
Providing an extra ceiling of plate glass and iron of double thickness, extending over the entire hall and the grand stairways, rearranging the gas fixtures over new ceiling, perforating the ceiling for the passage of the air into the hall, and supplying wire screen deflectors to distribute the air equally over all parts of the ceiling	66,335
Wire gauze fitted to backs of seats in galleries for passage of foul air through floor of galleries; perforated plates fitted to inside of front of galleries for passage of foul air; perforated plates fitted to cornice of front of galleries, for passage of foul air, and to prevent the exhalations from persons leaning over it from passing down to members on the floor; and additional registers in the hall floor, so that there shall be at least one at each desk	9,508
Removing bricks enough from between air-ducts beneath the hall floor to convert it essentially into one chamber, cutting an air-duct from beneath the hall floor to the exhausting blowers at the east end of the wing	12,726
Heating apparatus, having 44,582 square feet of block-tin tubular surface, arranged in eight congeries with steam and water pipes and valves complete, erected in place	123,018
Providing eight gas fireplaces, with marble mantels complete, in the cloak-rooms; new registers and fitting up committee and cloak rooms	8,709
Moistening apparatus, made entirely of block-tin pipe and equivalent to 40,000 square feet of fan surface	5,792
Pair of surface-condensing engines of 1,320 horse-power, having cylinders of 45 inches diameter by 6 feet stroke, and connected with these a pair of air-compressing pumps of 65 inches diameter by 6 feet stroke, and a tubular compressed-air cooler, having 9,000 square feet of brass tube surface; all erected in place, complete, for cooling the air in hot weather	94,552

Drying apparatus, having 5,570 square feet of block-tin tubular surface, with regulating valves complete, for removing the moisture from the air when it is too damp, or when it is made so by having cooled it	$30,754
Indicating air-pipes, hygroscopes, hot-well thermometers, steam cylinder indicator, engine-counters, and clock for engine-room	2,317
Total	688,653

I am prepared to enter into contract to execute the foregoing work in full accordance with the letter and spirit of my report to you of this date on the subject of ventilating the House wing, and furnish satisfactory sureties for the above-named sum of $688,653, provided that if, after it is completed and tried, the House shall pass a resolution of satisfaction with my work, I shall receive a further sum of 12½ per cent. of the above amount as a profit, the sum herein named being the net cost to me of doing the work.

I am, very respectfully, your obedient servant,

ALBAN C. STIMERS.

Hon. STEPHEN TABER,
Chairman Committee on Ventilation, House of Representatives.

Reply of Edward Clark, Architect of the Capitol Extension.

ARCHITECT'S OFFICE, U. S. CAPITOL EXTENSION,
Washington, D. C., January 11, 1869.

SIR: I have the honor to acknowledge yours of the 8th instant, transmitting plans, and report of Mr. A. C. Stimers, on the subject of ventilating the hall of Representatives, and requesting my opinion thereon, in regard to whether the execution of these plans would interfere with the structure, &c.

In reply, I have to say that after examining the plans, I do not consider that their execution will affect the stability of the structure as far as the walls and foundation are concerned, but at the same time I do not feel myself competent to give a reliable opinion as to whether the iron rafters are capable of sustaining the increased weight which would be imposed on them.

The report and plans are herewith returned.

I am, very respectfully, your obedient servant,

EDWARD CLARK, *Architect.*

Hon. STEPHEN TABER,
Chairman Committee on Ventilation, U. S. House of Representatives.

Reply of A. C. Stimers.

OFFICE OF ALBAN C. STIMERS, NAVAL ENGINEER,
No. 45 *William Street, New York, January* 15, 1869.

SIR: As the Architect of the Capitol does not pronounce upon the question of whether the rafters over the hall have sufficient surplus strength to carry with safety the additional ceiling I propose to place above the present one to form an air conduit, I present you with the results of my own calculations as follows:

Weight which may be placed with safety upon each rafter		67,500 lbs.
Weight of each rafter	12,000	
Weight of roof over each rafter	8,000	
Weight of ceiling suspended to each rafter	15,000	
Weight of proposed ceiling suspended to each rafter	9,000	
Total weight upon each rafter, including new ceiling		44,000 lbs.
Surplus strength after new ceiling is built		23,500 lbs.

I am, very respectfully,

ALBAN C. STIMERS.

Hon. STEPHEN TABER,
Chairman Committee on Ventilation, House of Representatives.

Reply of Horatio Allen.

NEW YORK, *January* 26, 1869.

SIR: I have received your letter of 20th instant, accompanied by Mr. Stimers's report on ventilation, &c. My opinion is asked, "Whether, if the plans of Mr. Stimers be carried through, the results promised in the report will probably be obtained."

The report is very full and very elaborate, and I regret that the shortness of the time allowed for its consideration, and engagements which require my attention, prevent such an examination as to the results of the cooling instrumentalities as will enable me to express an opinion as to that part of the proposed plans.

Mr. Stimers has presented very fully the various means to be used to effect a complete and thorough ventilation.

The provision for obtaining the air from an unobjectionable source and depriving it of dust; the method of forcing the air into and out of the halls, and securing a proper distribution; the mode and means of warming the air and effecting the proper degree of moisture—all appear to me excellent and well calculated to produce the result desired.

The method proposed for cooling the air by the introduction of compressed air, which expands on entering, has only recently been made use of, and I have not the time to possess myself of the practical information on which to base an opinion.

Yours, respectfully,

HORATIO ALLEN.

Hon. STEPHEN TABER,
Chairman Committee on Ventilation, House of Representatives.

OFFICE OF ALBAN C. STIMERS, NAVAL ENGINEER,
No. 45 *William Street, New York, February* 5, 1869.

SIR: As Mr. Allen does not express an opinion as to whether the mechanism I propose for cooling the air in hot weather will produce the results promised in my report, I beg leave to call your attention to the following extracts from standard professional works, by which you will perceive that Mr. Allen cannot be understood as denying in any manner that a powerful cooling influence will be produced by my engine of 1,320 horse-power, but only that he is not prepared at present to say that I will get, on a large, practical scale, the exact amount promised.

In John Bourne's "Recent Improvements in the Steam-Engine," 1865, pp. 237, 238, there occurs the following:

"ICE-MAKING MACHINES.

"One of the most remarkable applications of the steam-engine is to the manufacture of ice, which is accomplished by forcing the heat out of air by mechanical compression, and then by again allowing the compressed air to expand. Such demand is thus created for the restoration of the heat before forced out as to produce a great reduction in the temperature of surrounding objects. On the occasion of my first visit to India, in 1847, the inconveniences caused by the heat drew my attention to the subject of artificial refrigeration, which I proposed to accomplish by compressing air until its temperature became so high that its surplus heat would be readily extracted by the application of cold water; and then by allowing this air subsequently to expand under such circumstances as to generate power, a very low temperature it was plain would be produced, which might be regulated to suit the requirements of a practical system of refrigeration. Subsequently the same idea was propounded by various other parties; and an ice-making machine has been constructed, in which refrigeration is produced by power aided by the agency of ether. But in Kirk's machine for producing cold the ether is discarded and air alone is used, which air is passed through a regenerator, as in Sterling's air-engine. This machine is now in successful use in Young's Paraffine Works, in Scotland."

[From Mechanics' Magazine, (London,) 1857, vol. 66, page 125.]

"DESCRIPTION OF ENGINE.—ICE FORMED IN CYLINDER BY EXHAUST—DISCUSSION.

"Professor Rankine remarked that the same principle (*i. e.*, compression of air) had been applied by Professor Piazzi Smyth to the cooling of air for ventilation; compressed air was passed through tubes surrounded by water, so as to abstract the heat produced by compression, and, by being allowed to expand again, was cooled.

"Mr. Randolph calculated that the temperature due to compression of air to 30 pounds to the square inch would melt tin.*

* Tin melts at 442° Fahrenheit.

"Professor Rankine stated Dr. Gerrie, of Florida, made the first machine for making ice in this manner. Page 126—Mr. Fothergill saw an ice machine in London about 1843. (For Dr. Gerrie's account see Appleton's Magazine, 1851, page 375.)"

In the inaugural address of Mr. Elliot, president of the North of England Institute of Mining Engineers, (*vide* Van Nostrand's Engineering Magazine for January, 1869, p. 23,) he said:

"With regard to the duration of the coal supply in Great Britain I have no hesitation in expressing my opinion that it depends in a great degree upon the scientific improvements we are able to make in our mode of ventilating the workings. It is probable that the ordinary means of ventilation, whether by furnace or fan, may be aided by a change in the force or agency employed for the purpose of haulage and other underground work. As an instance of my meaning I may mention that the apparatus which I have introduced in South Wales, and which, by means of compressed air used as a motive power instead of steam, draws trams and pumps water with complete success, is found to generate ice in an atmosphere which is naturally hot and oppressive. The mechanical usefulness of these new air-engines seems capable of indefinite extension; while, as their cooling properties form a collateral advantage arising out of their use, it is at least possible that they may prove valuable auxiliaries to the more regular means of ventilation in extending the security and promoting the healthfulness of our mines. The difficulties of ventilation once surmounted, the extent of coal at our disposal is incalculably increased."

An ice-making machine was recently made in the Novelty Iron Works in this city—of which Mr. Allen is president—with which ice was made by cooling compressed air, and then permitting it to expand. The mechanic who had charge of its construction informs me that he had a small stop-cock on the top of the compressed air-chest, opening upward, and that when he opened this the moisture in the escaping air was immediately frozen, and there appeared a fountain of hail of exquisite beauty.

Mr. George H. Reynolds, superintendent of the De Lamater Iron Works of this city, informed me that he recently erected some air pumps for compressing the air used at a Bessemer steel works, and employed rubber valves. He says that with a pressure of 20 pounds per square inch the valves gave no trouble, but that with 25 pounds the heat was so great as to melt them. Now such rubber melts at about 300° Fahrenheit, and according to the formula I have employed, 20 pounds per square inch gives 283° Fahrenheit, when the air before compression is 95°.

This is pretty strong evidence that the formula cannot be much out of the way when applied to large practical operations.

You will observe that Mr. Allen indorses thoroughly every part of my report, which covers all the attempts of those who have preceded me in this branch of engineering, my proposal to cool the air of ventilation by steam-power being entirely new in this country.

As Mr. Smith emphatically indorses every part of the report, including the cooling, I will only remark that I have yet to learn of his having ever indorsed anything which afterward failed to give entire satisfaction.

I could give you many more extracts from various professional works regarding the efficiency of my proposed method of cooling the air, but as they are of a similar character to those given herein, they would not add to the force of this letter.

I am, very respectfully, your obedient servant,

ALBAN C. STIMERS.

Hon. STEPHEN TABER,
Chairman Committee on Ventilation, House of Representatives.

Proposition to warm in cold weather, cool in hot weather, and ventilate at all times, the Capitol extension, by Alban C. Stimers, naval engineer.

45 WILLIAM STREET, NEW YORK,
January 27, 1870.

SIR: Since the date of my report to the select committee of the House of Representatives (H. R. Rep. No. 19, third session Fortieth Congress, December 15, 1868) I have been studying how I could accomplish the perfect ventilation there promised, and reduce the cost.

The suggestion made to me by an honorable member of your committee (Mr. Jenckes) that the machinery employed should not be placed under the building itself, as is now done and as I had then proposed to do, but to erect a special building for it in the western park, and communicate with both wings by air-ducts only, thus ventilating the whole with one apparatus, was in itself a long step in the desired direction of economy, as in placing the machinery under the building I was compelled to introduce the air through an inlet tunnel of 15 feet diameter and 300 feet in length, while by the plan now proposed all air-ducts may be excavated from the surface, which costs much less

than tunneling. This suggestion also saves the great expense of cutting through massive granite walls in the foundations, and preserving their strength by the use of iron columns and beams. In addition to the advantages of this change on the score of economy, it removes the feeling of objection which existed to having powerful steam machinery in operation immediately beneath the building.

In the report to which I have referred it is explained that a velocity of 5 feet per minute would give a heathful ventilation and enable the mechanism employed to control the current; and the dimensions of the heating, cooling, drying, and moistening apparatus were determined upon the basis of supplying that quantity when the weather was extremely cold or hot, but blowers and blowing engines were to be employed of sufficient power to produce a velocity of 50 feet per minute in the hall, at times when no expenditure was required to change the condition of the air. I find, however, that a constant current of pure air past the person, having a velocity of 10 feet per minute, will give, with downward ventilation, all the sensation of freshness which could be desired. I therefore now propose to limit the power of the blowers and blowing engines to the magnitude necessary to furnish that velocity. For the two halls, the various committee and cloak-rooms, and the corridors of the two wings, this will require 280,000 cubic feet, or say ten tons weight of air per minute. To drive this with four blowers, through four separate ducts, into each end of each wing, and distribute it in the manner described, and to withdraw it with four exhaust blowers through four other separate ducts, and then drive it through a long underground duct to the chimney situated entirely without the grounds, each duct having the cross area hereinafter specified, will require engines of 250 horse-power, in lieu of those of 750 horse-power provided for in my proposition to ventilate the House wing only.

In my former proposition I designed cooling engines of sufficient power to reduce the temperature of the halls 20°, when not only the temperature but the humidity should be at its maximum, the power devoted to drying the air being equivalent to a cooling force of 24° more.

During the past summer I made some very careful observations with the view of determining how much the air may be cooled in hot weather in summer and continue to add to the comfort of the person with each degree of depression shown by the thermometer. The results were such that I became well satisfied I had provided a greater power for that purpose than could be advantageously employed.

The temperature of 75° Fahrenheit is a very pleasant one with summer clothing, but to go suddenly from a temperature of 95° to one of 75° gives an unpleasant sensation of cold, the reverse of comfortable or healthful. To reduce, however, from 95° to 85°, from 90° to 82°, from 85° to 80°, from 80° to 76°, &c., adds charmingly to the comfort, without any sensation of chilliness. This can be accomplished in both wings with cooling engines of 1,000 horse-power.

I propose, also, a further reduction of the cost by leaving out the block-tin wire screen at the entrance of the inlet tunnel, which, with the coping and curb around it, cost $15,000 for the House wing only, and would now introduce the air through the top of the ventilating house; and as it will have no chimneys, and its ventilation will be downward into the boiler furnaces, the purity of the air cannot be impaired as it enters.

Having explained the foregoing as changes from my proposition to the Fortieth Congress, I will proceed to explain my views of what will constitute a good ventilation of the two wings, including the legislative halls and their galleries.

The term *ventilation*, when applied to a building of this importance, should signify *the production and maintenance within doors of pure air, properly tempered with heat and moisture, regardless of the existing state of the weather.*

Thus, to maintain the air pure in any inclosed space occupied by persons, it must be constantly renewed; when the weather is cold the air of renewal must be warmed; when it is hot it must be cooled; when it is too dry it must be moistened; and when it is too moist it must be dried. Further: when air is warmed simply its relative humidity is lessened; and when it is cooled this is increased, so that, generally, when air is warmed it must be moistened, and when it is cooled it must be dried. Properly, however, the degree of moisture in the space ventilated should be as carefully observed as that of its temperature, and that which is most pleasant and healthful should be uniformly maintained, regardless of the condition of the outer air, or of the modifications which may have been made in its temperature.

A consideration of the subject is therefore properly divisible into the following heads:

1. The quantity of air necessary, and how it should be introduced.
2. Warming and moistening the air in cold weather.
3. Cooling and drying the air in hot weather.

The subject of regulating the degree of moisture in the air when it is neither warmed nor cooled is naturally involved in the above.

I. THE QUANTITY OF AIR NECESSARY, AND HOW IT SHOULD BE INTRODUCED.

In treating of the quantity of air required for ventilation, writers generally refer to

the number of cubic feet per minute required for each person in the apartment. This method is, however, defective, in that it does not take into consideration the vacant spaces where the air comes and goes without having come in contact with persons, except as they are to be filled with the somewhat vitiated air with which writers generally appear contented to have pervade occupied apartments.

I consider, however, that any system of ventilation is defective which does not furnish a constant supply of perfectly pure air to the nostrils of every person in an apartment, and to secure this there must be a steady current past the person, having a velocity too low to be perceptible to the senses, but sufficient to furnish a fresh supply to each inhalation. *It is the person, and not the apartment, that requires ventilation.*

Every person is at all times surrounded by an envelope of vitiated air, and the thickness of this envelope is dependent upon the direction and velocity of the air past the person. Thus, the average man is 5 feet 8 inches high and 1 foot thick from front to back. If, therefore, the direction of the current of air past the person is vertical, it will require to have $5\frac{2}{3}$ times the velocity that would be necessary if the direction was horizontal, to maintain the same thickness, or rather thinness, of the vitiated envelope.

Dr. Wetherill, in his interesting report on the ventilation of the Capitol extension, page 66, says:

"Hood (Warming and Ventilation, p. 261) estimates the air required for ventilation by the amount needed to take up the moisture from the skin and lungs. The air required for respiration (*i. e.*, oxidation) is very much less than that needed to hold in solution the vapor of the skin and lungs, which evolve 12 grains of water per minute. If the temperature of a room be at 60°, with a dew-point of 45°, a cubic foot of air will absorb $2\frac{1}{4}$ grains of vapor; or, in other words, the perspiration from the body will saturate $5\frac{1}{4}$ cubic feet of air per minute. If, however, we take the dew-point lower, say not to exceed 20° or 24°, then $3\frac{1}{4}$ cubic feet of air per minute will be required to carry off the insensible perspiration, while for the pulmonary supply one-fourth cubic foot will be needed, making a total of 4 cubic feet. In summer, as the dew-point is higher, more air will be needed, viz, 5 cubic feet per minute for summer ventilation."

In a foot-note to the above it is stated that Seguin gives the exhalation of water from the lungs, 7 grains; from the skin, 11 grains; total, 18 grains, per minute.

This is undoubtedly the correct method of ascertaining the number of cubic feet of air vitiated by each person per minute, and, as will appear further on in this report, the dew-point should be maintained uniformly at 52°; we can make the calculation of quantity exact for this case.

A cubic foot of air at a temperature of 65°, with the dew-point at 52°, will absorb $2\frac{1}{2}$ grains of vapor; and if we take the mean of the two authorities above cited regarding the quantity exhaled by each person, we will have 15 grains per minute; and, to absorb this under the above conditions will require 6 cubic feet of air. Add to this the one-fourth cubic foot required for breathing, and we have $6\frac{1}{4}$ cubic feet as the total amount vitiated per minute.

The surface of an average man is about 18 square feet. If, therefore, we imagine such a man walking in the pure open air at the rate of two miles an hour on a perfectly calm day, the air will be flowing past him at the rate of 176 feet per minute; and, as he is one foot deep from front to back, the average thickness of the envelope of vitiated air which surrounds him may be found as follows:

Let a = The quantity of air vitiated per minute in cubic feet..... = $6\frac{1}{4}$
b = The surface of the person in square feet..... = 18
c = The extent of the person in the direction of the current of air in feet = 1
d = The velocity of the current in feet per minute..... = 176
x = The thickness of envelope in inches.

Then,

$$\frac{12ac}{bd} = x$$

and

$x = 0.018$ or $\frac{1}{55}$ of 1 inch.

In supplying air for the ventilation of a hall containing an assemblage of people, however, it is absolutely essential that the direction of the current should be vertical; otherwise that which has been vitiated by one person will be given to another to breathe and perspire into.

If, now, we assume a man standing upright, of the average height of 5 feet 8 inches, and the velocity of the current at 5 feet per minute, we will have for the value of the terms in the above formula—

$a = 6\frac{1}{4}$
$b = 18$
$c = 5\frac{2}{3}$
$d = 5$

Whereupon

$x = 4.16$ inches.

If this envelope of 4 inches thickness of vitiated air be drawn upward, it is clear that the nose and mouth will be always supplied entirely with vitiated air, no matter how pure it may be one foot away; while if it is drawn downward, those organs will always be supplied with perfectly pure air. This consideration alone is quite sufficient to determine us in favor of the downward direction. There are, however, some other advantages in the downward over the upward direction, which it may be well to state.

The temperature of the human body rarely varies 2° either way from 98°, a sudden variation of 5° or 6° being said to be fatal. If, therefore, the air is supplied at a temperature of 65°, it will be 32° cooler than the body; with the downward current, the head will be in this cool air, while the feet will be inclosed in an atmosphere nearly if not quite as warm as the blood within them. And to "*keep the head cool and the feet warm*" is one of the fundamental rules of hygiene as well as of comfort.

Again, with upward ventilation the entire halls are filled with vitiated air, the vitiation having taken place near the point of admission; while with downward ventilation the vitiation takes place near the point of exit, and the whole upper part is full of pure air.

The height from floor to ceiling of the halls is 36 feet; if, therefore, the air is admitted through apertures well distributed in the ceilings, it has 30 feet to move before it comes in contact with the heads of persons on the floors. During this movement all eddying currents, induced by the increased velocity with which it is necessary that it shall pass through the apertures have become quiet, and the whole mass descends with a uniformity impossible to obtain in the vicinity of the persons ventilated with upward ventilation; and *one of the most important considerations to be kept in view in ventilating an apartment is to avoid perceptible draughts.*

Mr. Goldsworth Gurney, in his examination before a committee of the House of Lords of the British Parliament, March 24, 1854, said in reply to the question:

"In those courts which you have ventilated, you have found your system answer?"

"Yes, we have found the down current always more agreeable. The up current is sometimes used, but it is not so pleasing, and not so effectual."

The hall of the Massachusetts house of representatives has recently been provided with new ventilating arrangements, and the downward system has been adopted.

One objection brought against the downward system is that it is against nature to force air downward. Although this opinion is entertained by an extremely large number of otherwise well-informed persons, every engineer of ordinary attainments knows perfectly well that it is as easy to force air in one direction as another. Another objection is, that as the air is warmed at the same time that it is vitiated, that which is thus vitiated and warmed has a tendency to rise, whatever may be the direction of the general mass surrounding it. This is true, but this tendency is so feeble that its opposition to a current of 5 feet per minute would not be perceptible.

It has been shown that with a vertical current of 5 feet per minute, the mean thickness of the envelope of vitiated air surrounding a man of the average size, when standing, is four inches. This is more than two hundred times as thick as when he is walking at the rate of two miles an hour in a perfect calm. As, however, the air is to be brought from such a direction that the mouth and nose are always supplied with air of absolute purity, and the velocity is sufficient to insure the control of its direction by the mechanical means employed, I have assumed it for the *minimum* velocity to be given.

When the weather is fine, or, in other words, when the outer air from which the supply is derived, is in the desired condition as regards temperature and moisture, and no expenditure is required upon its condition, then a *maximum* amount may be given, the *minimum* being employed when its condition as regards temperature and moisture has to be changed to the greatest extent. The only limit to the amount of air it will be advantageous to supply is that fixed by the rule, that the currents past the person must not be sufficiently rapid to become sensible. Some persons are sensible to currents of much lower velocity than is required to render others conscious of them. Most people can feel a current having a velocity of 150 feet per minute; very few can perceive one of 90 feet per minute.

The most delicate person would, therefore, be unconscious of a current of 50 feet per minute, but as 10 feet per minute will give a beautiful fresh ventilation, I propose, for reasons of economy, to limit myself to furnishing that for a maximum velocity. The average thickness of the vitiated envelope will then be two inches, or one hundred times thicker than when walking out doors in a calm. With downward ventilation, however, the nostrils are in the pure air equally as when walking, the vitiated air enveloping the lower part of the person only, leaving us unconscious of its presence.

The Senate chamber is 115 feet 6 inches long by 81 feet wide. The hall of the House is 139 feet 4 inches long by 93 wide. The downward current within them would therefore have a combined transverse area of 22,284 square feet. A velocity of 5 feet per minute would then require a supply of 111,420 cubic feet, and one of 10 feet per minute a volume of 222,840 cubic feet per minute, to supply the legislative halls only. The

committee and clerk's rooms and the corridors need a supply that would carry these numbers to 140,000 and 280,000 respectively.

The provisions for heating, cooling, moistening, and drying the air should, therefore, correspond with the lesser, while those for propelling it into and out of the building should be adequate to control the greater of the above quantities.

The first method adopted by engineers and architects to give movements to air for the ventilation of mines and buildings was to heat an up-flowing column, thus lessening its specific gravity and causing it to rise with corresponding force. That system is still employed in the British houses of Parliament, where in each of its many towers a charcoal fire is kept burning, and thus a force obtained to propel the air through the building.

During the past year screw-propeller fans, driven by steam-engines, have been introduced into several of these towers to insure a proper draught in unfavorable weather.

It has been practically demonstrated, however, that one pound of coal burned in the furnace of a steam boiler, which furnishes steam to drive a fan blower, will generate as much force, and consequently is capable of producing as strong a current of air as 38 pounds expended in heating a column of air to act by its diminished gravity.

English mining engineers commenced about ten years ago to apply fan blowers to the ventilation of mines. The French had previously adopted the same practice. In addition to the economy of this method, the complete control which the attendant is enabled to maintain over the quantity of air supplied at all times is found to be of great advantage.

Since mankind have lived in houses, windows have been placed in the sides, which it has been the habit to open when the weather was favorable for the purpose of ventilating the apartments within. This practice has been so general, that surrounding the legislative halls of Congress with corridors and committee-rooms, as has been done with the new wings of the Capitol, is regarded with great disfavor; and many people are decidedly of the opinion that they never can be satisfactorily ventilated until the halls themselves are brought out to the sides of the building, and have windows opening directly into them. It is regarded as a fault in the architecture that the only practicable ventilation must be such as would supply air to any pent up place.

For any inclosed space, however, where large numbers of people collect and remain during several hours every day, windows in the sides, which communicate directly with the weather, would manifestly be of no avail when kept closed, as they must necessarily be except in good weather; and even then they are not effective unless the wind is blowing. A remarkable proof of this occurred in Calcutta more than a hundred years ago.

On the 19th day of June, 1753, the native Indian forces attacked and captured Calcutta from the English. At night they thrust one hundred and forty-six English prisoners into what was known as the "Black-hole prison." This was a room on a level with the ground, eighteen feet square, with two open windows on one side, barred, of course, to prevent escape, but free to admit air and light.

These prisoners had not been in the place five minutes before they discovered that they were in danger of suffocation, and, indeed, the weakest soon began to become insensible. Those near the windows entreated the guard on the outside to have them put somewhere else, and a message was sent to the commander of the Indian forces to inform him of the state of affairs; but he was asleep, and Eastern etiquette would not permit of his being awakened, and as he slept until morning no relief was afforded during the whole night. Meantime one hundred and twenty-three of the prisoners died for want of fresh air, only twenty-three living to walk out when the door was opened. These were nearly dead, and did not recover their health until after having passed through a severe attack of boils, which broke out all over the entire person. In this case the windows were ineffective as ventilators, simply because the night happened to be calm.

Even when the weather is good, the temperature of the air delightful, and the wind blowing with the most desirable force, an open window in the side of a great hall, filled with an assemblage of people, would furnish air to those farthest from the windows filled with emanations of all the persons it had passed on its way.

To propel the air into the building I would therefore employ four fan blowers, having in the aggregate a capacity of 280,000 cubic feet per minute. These would be situated on the ground floor in the ventilating-house already mentioned, and from each there would be a separate air duct, one leading to the upper part of each wing into the chambers above the ceilings. Those in the south wing would pass up back of the grand stairways, and would each have a cross area of 20 square feet. Those in the north wing would pass up in the southwest and southeast corners, and would each have a cross area of 15 square feet.

Above the ceilings I would provide additional ceilings of plate glass and iron of double thickness, that they might be non-conductors of heat, and above these I would fix the gas burners, adding about fifty per cent. to the present number. These extra ceilings form air ducts of such character that the air may be thoroughly distributed over the

ceilings before passing down into the halls. As the glass in the ceilings would be of the best quality of clear plate it would be no perceptible obstruction to the light, even if the gas-burners were not increased in number; while, as there would be six inches depth of confined air between the two thicknesses, neither the heat of the summer sun nor that of the gas-lights would raise the temperature of the inflowing air; and in winter they would equally protect the warmth which had been previously given to it. Openings through the present ceilings would be provided such that their present ornamental appearance would not be changed, and an equal area of opening would be obtained in each of the many squares into which they are divided.

To insure the continuance of the air thus admitted through the ceilings in a direct vertical line down to the floors and to the galleries, frequent openings throughout their extent, which should communicate with the air-chambers beneath the floors, would be made, especial means being provided to prevent the foul air from the galleries from flowing down upon the members on the floors; and from these sub-chambers I would withdraw the air by means of four fan-blowers, of equal dimensions with those employed to drive it in. These foul-air blowers would also be situated in the ventilating house, and each would have its separate duct leading from each end of each wing.

These air-ducts, four from each wing to the ventilating house, would be made of brick, and arranged in congeries, the top of each congeries being situated six feet beneath the surface of the ground, so as not to interfere with any desired situation of trees.

The foul-air blowers deliver the air they have withdrawn from the building into an underground conduit common to them all, into the center of which will also be delivered the escaping gasses from the steam-boilers upon which the air from the blowers will act in the manner of an ejector, securing at all times an efficient draught through the boilers. This conduit will extend to the base of a chimney situated without the grounds, so that the foul air and smoke will be delivered at a distance from the Capitol and from the supply of pure air. All these blowers would be driven by one pair of engines, through the medium of appropriate gearing, shafts, and belts. In every case of gearing there would be wooden teeth working into cut-metal gear, which, it is well known, may be made to run with perfect silence, and is more durable than metal gearing. By running all the blowers from one pair of engines, a uniform relation of the forces employed in different localities is thoroughly secured under all circumstances. It will thus be perceived that the air would be driven in through the ceilings and drawn out through the floors with equal force, and that if the doors are left open into the corridors, either from the floor or from the galleries, there will be no tendency for the air to flow either into or out of the hall. At present the provision for the egress of the air through the ceilings is so much greater than that for forcing it up through the floors that there is a constant flow into the halls from the corridors through every open door, both on the floors and in the galleries, (*vide* the Hon. John Covode's report on the ventilation of the hall of the House of Representatives, made June 20, 1868, p. 2.)

If the forces employed to drive the air in through the ceilings were greatly in excess of those provided for drawing it out through the floors, and the doors were left open, the direction of the current would be changed from the direct vertical line to oblique ones toward the doors, and while those sitting near the walls might get their share of pure air, those in the center of the floors would not.

Again, if the forces for withdrawing the air were greatly in excess of those for supplying it, the air would flow into the halls from the corridors through the open doors, disturbing the direction and equal distribution of the pure air, and interfering with whatever modification there had been made in its condition as to warmth and moisture.

By the plan proposed, however, complete control is maintained over the direction, distribution, and velocity of the entire mass of air which fills the halls.

Messrs. Shedd and Edson, in their report on ventilation to a committee of the Massachusetts house of representatives, dated January 1, 1865, remark in regard to this as follows:

"As regards the manner of applying the power to effect the change of air, it is sometimes applied to the exhaustion of the foul air and sometimes to the supply of the fresh air. Either way is effectual in a degree, but neither alone accomplishes quite all that is to be desired. Forcing the fresh air in abundantly will drive out the air already in the hall at every outlet, and it is essential for security against the intrusion of cold currents through cracks and doorways. But it will drive out mainly at the easiest outlets, and some of the most important may be neglected because of being out of the easiest way for the air to pass. The only sure way to get the air out just where you want it to go out is to apply an exhausting force at the outlets to guide and assist the expelling force. The filling method is called the plenum method, and the exhausting the vacuum method.

"Much has been said about the superiority for working vigor of air in a plenum or

over-pressure condition. There is no doubt of the fact that under a high atmospheric pressure a man has greater power than under a low pressure. But the amount of superior pressure that can be obtained in a common hall is very slight and can hardly have a perceptible effect. A nearly even balance of the filling and exhausting forces, making the in-door barometer about the same as the out-door, but with the filling force enough in excess to keep out all air seeking to enter without leave, is the most economical and satisfactory condition to obtain."

The power of the blowing engines has been determined in the following manner:

The aggregate transverse area of the pure air ducts is 70 square feet, and the total quantity of air supplied is 280,000 cubic feet per minute.

Let v = velocity of air through ducts in feet per second; then

$$v = \frac{280000}{70 \times 60} = 66\frac{2}{3}$$

To find the velocity per square foot necessary to produce this velocity

Let v = velocity in feet per second ..... $= 66\frac{2}{3}$
w = weight of air per cubic foot ..... $= 0.075$
g = accelerating force of gravity ..... $= 32.$
p = pressure in pounds per square foot—

Then,

$$p = w \frac{v^2}{2g} = 5.2$$

To maintain this pressure at the ends of the long ducts farthest from the blowers, it must be doubled at the blowers, on account of the friction and the obstructions caused by changes of direction, making 10.4 pounds per square foot.

Then 10 per cent. of the power of the engines must be allowed for that necessary to drive the engines, the shafting, and the blowers; leaving 90 per cent. of the power as applicable to the production of the pressure of 10.4 pounds per square foot and velocity of $66\frac{2}{3}$ feet per second.

The power required to drive the pure air into the building would then be as follows:

$$\text{HP} = \frac{70 \times 66\frac{2}{3} \times 60 \times 10.4 \times 100}{33000 \times 90} = 98$$

It requires an equal power to drive the foul air from the ventilating house to the chimney and out of it, and the air thus driven is drawn through long ducts, the friction of which absorbs one half the power. To perform the whole work the above quantity must therefore be increased two and a half times.

The total power required will therefore be as follows:

$$\text{HP} = 98 \times 2.5 = 245,$$

or, in round numbers, 250.

PLACE OF OBTAINING THE AIR.

In the report of Senator Buckalew to the Senate, from the Joint Select Committee on Ventilation, made February 20, 1865, he says:

"The air for ventilating the halls is now taken from the level of the terraces between the wings and the old Capitol building on the western side. To these situations much dust and other impurities are carried by the action of the winds, subjected to the influence of eddies, and taken with the air through the ventilating passages into the halls. And in warm weather, the terraces and adjoining walls becoming heated, affect very considerably the temperature of the air obtained. Reference upon this point of the inquiry is made to the testimony of Dr. Antisell, and Mr. Forney, the engineer in charge of the ventilation of the House of Representatives. It is manifest that the air introduced into the halls should be obtained from places not subject to the accumulation of impurities, or to the undue production of heat."

The architect of the Capitol, Mr. Edward Clark, in a report dated November 1, 1866, states:

"Objections have been made to the fresh-air source. The present inlets are near the angles of the wings and connecting corridors, and are liable at all times to admit dust, and oftentimes do admit other impurities thrown from the windows; besides, the air at this place has an increased temperature in summer, obtained from the heated walls and pavement.

"In order to obtain a purer, and in summer a cooler, supply of air, it is proposed to construct an underground duct, opening in the eastern grounds, which opening could be made an ornamental feature by placing a fountain in its center. The jets and overflow would assist in cooling the air and to rid it of any mechanical impurities with which it might be charged. A separate duct and fountain will be required for each wing."

Mr. Charles F. Anderson, an architect and civil engineer, in a report to the Joint

Select Committee on Ventilation, &c., says that the present plan "receives the exterior air under the ground floor from off the surface of the overheated and dusty terraces, furnishing much of the bad air from beneath, carried to its surface by evaporation and side currents of air from the ground; and this air is also tainted with much of the odors caused by the machinery near which it passes." This gentleman proposed the erection of high towers to serve as openings to the inlet ducts.

It has already been explained that I propose to obtain the air at the top of the ventilating house, which will be situated in the center of the western park, where there will be no influences affecting its perfect purity.

II. WARMING AND MOISTENING THE AIR IN COLD WEATHER.

There are three methods in common use for warming the air of ventilation in buildings: First, by passing it over iron surfaces which are heated directly with fire and the products of combustion; second, by passing it over iron pipes filled with steam; and third, by passing it over iron pipes filled with hot water. The first of these methods is considered as so highly objectionable as to be entirely discarded in first-class buildings. When air is brought in contact with highly heated iron surfaces an unpleasant odor is given to it, so that people say that it is burnt, and there is a general belief that it is a very unhealthy air to breathe.

The employment of steam-pipes is regarded as an amelioration of the above difficulty, as their temperature is not so elevated; and hot water is used in preference to steam in order more fully to secure the same end.

In the examination of Mr. Goldsworth Gurney before a committee of the British House of Commons, March 31, 1854, he testified as follows upon this point:

"Question 31. Do you think that the offensive smell may arise in any degree from the use of metal pipes?—Answer. There is sometimes what is called a 'ferruginous odor' produced from iron pipes, but I believe not much in the present case: burnt air is the great source, the decomposition of small particles of animal matter which always float about in the atmosphere. This question has been settled by French philosophers many years ago; it is not from the decomposition of the nitrogen and oxygen, but from the decomposition of these ammoniacal matters which are always found more or less in the atmosphere.

"Question 32. Would you be disposed to recommend any other material than iron for the warming pipes?—Answer. I should prefer zinc; it is clean, a good conductor, and radiates heat well."

My own opinion is that the rusty surface of the iron imparts most of the offensiveness experienced, and that therefore the term "ferruginous odor" is correct, and as it is impossible to employ iron pipes for this purpose without their surfaces soon becoming rusty, the true remedy is to supply a more cleanly metal, as recommended by Mr. Gurney. That gentleman afterward, in rearranging the ventilating apparatus of the houses of Parliament, employed surfaces of sheet zinc, heated with hot water. The improvement in cleanliness by exchanging zinc warming surfaces for iron was very great, but an equal improvement over the zinc surfaces can be made by the employment of pure block-tin tubes. This is superior to all the useful metals in its power to resist atmospheric influences. In this respect, indeed, it is superior to silver. It is a good conductor of heat, and though its bright surface would prevent its radiating heat well, as claimed by Mr. Gurney for zinc, this is unimportant, as air is not warmed by the heat of radiation, but only by direct contact with bodies warmer than itself.

Recent improvements in the mechanic arts have brought tin-encased lead pipe and solid block-tin pipe largely into use for conveying water in dwellings; its cleanliness and healthfulness strongly recommending it.

I would, therefore, employ pure block-tin tubes, filled with hot water, for warming the air. This would not only warm the air without imparting any odor whatever to it when the apparatus was new, but would continue to do so for a great many years after zinc had become entirely coated with its oxide, or iron had rusted through and through and been many times renewed.

There will be several congeries of tubes in each of the four tempering ducts in the upper story of the ventilating house for warming the air. They will be secured into brass tube beads in the same manner as in the surface condenser of a marine engine. They will stand vertically, and open at each end into steam-tight chambers or chests. Into the upper of these I would introduce steam from the boilers, and from the lower I would draw off the water by appropriate pipes, the valves of which would be situated in the engine-room below.

It will be understood that with this arrangement the apparatus would be a steam-heater, if the extent of the tubular surface was limited to the amount necessary to warm the air by the condensation of steam only; but that if the surface is enlarged to the amount required to warm the air with hot water, the steam will be condensed in the upper chambers and the upper ends of the tubes, hot water filling the remainder of the tubes and the lower chambers. A valve in the pipe through which the water

flows away would control the rapidity with which it was drawn off, and, consequently, its temperature. In ordinarily cold weather this would be a hot-water warming apparatus; but upon any extremely cold day it would become a steam-heating apparatus, as the attendant opened the regulating valve in the drain-pipe.

To decide the amount of warming-tube surface necessary, it is first requisite to consider the subject of

MOISTENING THE AIR.

Water pervades the entire human system; considered mechanically, it performs the functions of a lubricant to all its parts. The ligaments and muscles move freely in their places, because every fiber of them is coated with water. The skin and hair are soft and pliable for the same reason. In all mechanism the lubricant must be constantly renewed, as the surfaces it lubricates are always wearing away, the particles worn off being absorbed by the lubricant and flowing away with it. In the case of the human body we find the lubricating water, the supply of which is kept up by our daily food and drink, working its way gradually to the surface through the skin and lungs to the air, where it arrives loaded with the worn-out particles of our animal nature, and into which it evaporates.

Now the rapidity with which water of a given temperature will evaporate into the air in a state of rest is dependent entirely upon how far the condition of the air in regard to moisture is removed from the point of saturation. And in the case of the evaporation from our bodies, if it is too rapid, the skin becomes too dry, and this again induces too rapid a flow of the water within the system toward the surface, making us uncomfortable, and sometimes ill.

Again: the process of evaporation is a cooling one to the surface from which the evaporation takes place. This is explained by the absorption of the latent heat which occurs upon the conversion of a liquid into a vapor. When, therefore, the evaporation is too rapid we are uncomfortably cold, even though the temperature of the air may be sufficiently high.

On the other hand, if the evaporation is too sluggish, the flow of water toward the surface is retarded, and we are made uncomfortable and sometimes ill in another way; also, if the air is of the proper temperature we are uncomfortably warm, the general feeling being described by the term *sultry*.

It is highly important, therefore, that the condition of the air as to moisture should be maintained, in any system of ventilation, at that which is most comfortable and healthful; indeed, that which is the most comfortable is the most healthful.

Most writers upon the subject of the ventilation of large assemblages say that it is impossible to adjust the condition of the air so that all will be comfortable; that persons whose blood has become thinned by age or illness, or who are naturally thin and cool-blooded, require a higher temperature than those who are young, strong, and full-blooded. Also, that in an assemblage where, as in this case, the same person sometimes sits during the entire session of the day without moving or speaking, and at others exerts himself strenuously in a vigorous speech, he is either too cold or too warm, accordingly as he sits still or exerts himself.

My observations and studies upon this subject, however, lead me to the conclusion that if the degrees of heat and moisture are both properly tempered, *i. e.*, each brought to the average of the most comfortable for all, there will be no complaint. The aged and feeble may feel cooler than the young and strong, but they will be comfortably, not uncomfortably cool. Also, when a member sits quietly in his seat all the day, he will be cooler than when he exercises, but then it will be a comfortable coolness; and when he has greatly exerted himself in an extended speech, in which his deep interest may have led him to become excited, although he will feel warm, it will not be an uncomfortable warmth. *Indeed the question is not whether persons feel warm or cool, but whether they are comfortably or uncomfortably so.*

As a general rule, the only point which receives proper attention in the ventilation of large assemblages is that of the temperature. The air is almost always too moist or too dry, generally the latter in cool weather, even if pure, so that the degree of comfort experienced by each is dependent upon his strength and health. It does not hurt a young, strong, healthy person so much to draw the water out of him too rapidly or too sluggish as it does an old, feeble, or sick person. But the health and strength of the most vigorous man are gradually undermined by any extended persistence in living in air which has either a great excess or deficiency of moisture, and one of the great difficulties about it is, that in nine cases out of ten he does not know why his health has failed.

I would therefore provide for controlling the amount of moisture in the air, so that the exact degree of it desired should be maintained with the same precision as the temperature.

The eminent Professor Henry, of the Smithsonian Institution, in a report on warming and ventilating the Capitol, dated May 4, 1866, remarks upon this point:

"It is evident that the great object of warming and ventilating an apartment in the

winter season is to supply it with pure air of the same degree of temperature and the same amount of moisture as that of an open space in a pleasant time in summer. To fully attain this object is a very difficult matter, but that system of warming and ventilation is certainly the best which approximates the nearest to this desirable condition. The heating of the air and preserving it at the desired temperature is the simplest part of the problem; to remove the impure air and to supply its place with fresh air, without giving rise to unpleasant currents and unequal temperature, is more difficult; to supply the proper quantity of moisture, and to prevent its condensation, is attended with still greater difficulty, particularly when the apartments containing a large number of persons are to be thoroughly ventilated. This part of the general problem is, in my opinion, an essential element of proper ventilation, although it has hitherto received comparatively but little attention in this country.

"The idea is entertained by some, that because the heating of a large volume of air to the required temperature of the room does not abstract the aqueous vapor which it contains, that hence the evaporation from a surface of water is not required to render such air salubrious. It should, however, be recollected, that when the external air is, say, at the temperature of zero, all of its aqueous vapor has been condensed, with the exception of an almost imperceptible quantity, and when this desiccated air is afterward heated to a temperature of seventy degrees, its *capacity*, so to speak, for vapor is so much increased that moisture exhales into it with great energy from all bodies from which it can be evaporated. A rapid current of ventilation of air in this condition constitutes an artificial sorocco. * * * It is true that the supply of the necessary amount of moisture will increase the cost of heating and ventilation, but this is a consideration which cannot in most cases be allowed to weigh against health and comfort."

From the report of Dr. Wetherill, on the warming and ventilation of the Capitol, to which reference has already been made, I extract the following remarks:

"For an atmosphere which shall be salubrious to the inmates of an apartment, the hygrometric condition of the air is as important as its freedom from poisonous or deleterious gases.

* * * * * * * * *

"The evaporation of water from the body is intimately connected with health. The sudoriparous glands, which are constantly secreting their liquid, have a length of tubing which has been estimated at twenty-eight miles. The secretion takes place so gradually that the water ordinarily evaporates as insensible perspiration as soon as it reaches the exterior surface of the skin.

"During severe exercise, exposure to great heat in some diseases, or when the evaporation is hindered by an impermeable covering, the secretion collects upon the exterior of the body in drops of sensible perspiration.

"The total average loss by the lungs and skin in twenty-four hours is almost three and a half pounds of water, of which somewhat more than two-thirds, say two and a half pounds, are furnished by the skin. Of these two and a half pounds only one-sixth is furnished by the vital process of secretion by the sweat glands, for the greater part of the moisture transudes through the skin by simple evaporation. The cutaneous and urinary excretions are, as is well known, vicarious. The evaporation from the skin regulates the animal heat, the body being in an analogous condition to those porous earthen jars in which the inhabitants of tropical climates cool water by the evaporation of that portion which exudes to the surface of the vessel.

"The estimated loss of heat to the body by evaporation per minute is sufficient to raise half a pint of water from the freezing to the boiling temperature.

"For health the body must evaporate a quantity of water within certain limits. The amount evaporated is influenced by the hygrometric condition of the air, and by the state of the body itself. The evaporation is increased by muscular action and by a dry atmosphere; it is diminished by repose and by a moist air.

"If the functions of the skin are interrupted certain diseases are manifested. Among these are affections of the throat, catarrh passing into acute bronchitis, pulmonary consumption, pericarditis, inflammation of the stomach and bowels, dyspepsia, rheumatism, gout, and fevers.

* * * * * * * * *

"The rapidity of evaporation of a body depends principally upon the low relative humidity of the air at a high temperature, and upon the maintenance of this condition in the neighborhood of the body by the action of currents of air. Thus, with too great dryness of the air, particularly at an elevated temperature, and especially if it pass rapidly over the body, there will be a greater degree of evaporation than is consistent with health. On the other hand, in an atmosphere saturated with moisture the evaporation from the body would be reduced to a minimum, and would be practically nothing in such air having the same temperature as the body. Although we may bear with impunity these extremes for a short period, a persistence in such conditions would be fraught with danger.

* * * * * * * *

"It is certain that the hydration of the air will involve in the winter a considerable expenditure of fuel for a powerful ventilation, but the hydration is as necessary to health and comfort as the warmth."

Dr. Youmans, in his Handbook of Social Science, page 308, says:

"Air changed in temperature by warming without increased moisture, is apt to produce unpleasant feelings and painful sensations in the chest, which are often attributed to too great heat. In very dry air the insensible perspiration will be increased, &c. The objection lies against heated air, no matter how heated. Stoves and air-furnaces, with their red-hot surfaces, are undoubtedly worse for the air than hot-water apparatus, which never scorch it; yet the latter may pour into our apartments a withering blast of air at one hundred and fifty degrees, which may be potent for mischief. The only way that hot air can be made healthful and desirable is by an effectual plan of artificial evaporation."

In the report of Senator Buckalew, to which I have before alluded, he says, (page 4:)

"It follows that the dry and warmed air for supplying rooms of great magnitude must be passed over an evaporating surface of great extent, in case that mode of hydrating it be adopted. Doubtless warming the water would increase the efficiency of the plan. Dr. Antisell recommends spray, or jets of water thrown into the air at a right angle to its current, which would no doubt be an effective and satisfactory mode of accomplishing the object where the necessary facilities can be established, among which space is indispensable. The objections to the use of steam, on an extensive scale, for hydration are the production of noise, and, as alleged, of odor, and its imperfect dissolution in the air before entering the chamber. It passes on with the current of air for some time before it becomes dissolved and incorporated with it, and moisture is deposited upon all surfaces with which the volume of air comes in contact. There is no arrangement for introducing steam into the air passing to the halls; but it was provided for the air directed to the committee-rooms and passages. The plan was not found to work well, and has not been in practice."

Mr. Lewis W. Leeds, the consulting engineer of ventilation and heating for the United States Treasury Department, &c., in a report to the Hon. John Covode, on the ventilation of the House of Representatives, January 13, 1868, says upon this point:

"There seems to be an entire unanimity among all parties as to the necessity for additional moisture. This I think of much importance. I, however, doubt the propriety of allowing the steam to be discharged directly into the fresh-air chambers. There is often an unpleasant smell from escaping steam, and more frequently from the air driven from steam-pipes as the steam enters."

The plan I would propose for moistening the air is, to place in the air-ducts extending downward from the tempering ducts in the upper story of the ventilating house, to the horizontal ducts under ground, a system of water-pipes, also made of pure block-tin, standing vertically, their ends closed, and their circumferences throughout the length of the pipes pierced by a great number of minute holes. The water driven into these pipes with force would spin out of these holes radially from each pipe, filling the entire duct with a fine shower. The air passing through this shower would be moistened, and a valve in the engine-room, regulating the force with which the water was driven into the pipes, would determine the degree of moisture at which the air should be delivered into the building.

There are several methods in common use for designating the degree of moisture of the air, viz:

1. The number of grains, in weight of water, per cubic foot of air.
2. The tension of the vapor in height of a mercurial column.
3. The depth of water there would be on the ground, if all the vapor in the air should be suddenly condensed and fall.
4. The "break" or difference between the wet and dry bulb thermometers.
5. The temperature of the "dew point."
6. The "relative humidity" or per centum which the amount of moisture in the air is of that necessary to saturate it at the same temperature.

The last of these is the most popular method, because it appears to be the general opinion that this expression should be uniform for all temperatures to render the air comfortable and healthful to live in. There does not, however, appear to have been any very exact determination of what this should be, but, with a temperature of 65°, a strong, healthy person is not uncomfortable when it ranges above 50 and below 80; but in the course of some careful observations of the effect upon delicate persons in feeble health I have found them commence to complain when it went as low as 60, and again when it went up to 70; the complaint being, however, that it was too cool with the former degree of moisture and too warm with the latter, although the dry bulb thermometer continued at 65°. With a temperature of 65° and a relative humidity of 65, however, I have heard no complaints; and I find that personally I can sit quiet or exercise in air of that condition with great comfort with indoor winter clothing.

With the entire ventilating apparatus arranged as I would propose, these points can be fixed upon and afterward maintained as may be found desirable by experience;

but I will assume the above temperature and degree of moisture as the base of my calculations for the amount of surface required for warming tubes.

A relative humidity of 65 with a temperature of 65° corresponds with—

4½ grains of water per cubic foot of air;

A tension of $\frac{4}{10}$ of an inch of mercury;

A depth of 5½ inches of water on the earth;

A break between the wet and dry bulb thermometers of 5½°, and

A dew-point of 52°.

To exhibit the increased capacity of the air for dissolving the vapor of water as its temperature is elevated, the following table is extracted from one by Guyot, quoted by Dr. Wetherill in his report:

Temperature of air.	Vapor in grains per cubic foot.	Temperature of air.	Vapor in grains per cubic foot.
Degrees.		*Degrees.*	
0	0.545	55	4.860
5	0.678	60	5.756
10	0.841	65	6.795
20	1.298	70	7.992
30	1.968	75	9.372
32	2.126	80	10.949
40	2.862	85	12.756
45	3.426	90	14.810
50	4.089	95	17.145

The temperature of the external air in Washington is so seldom below 20°, even in cold winters, that I would limit the surface of the warming tubes to an ability to warm the air entirely with hot water from that degree of coldness, and for colder weather would allow it to become a steam-heating instead of a water-heating apparatus, as already explained.

The lowest degree of humidity of the external air reported by Dr. Wetherill, as found in his experiments, was 1.11 grains per cubic foot. I will assume one grain for the base of calculation. There will then have to be added 3½ grains per cubic foot to give it a relative humidity of 65 when at a temperature of 65°, and as there are 7,000 troy grains in one pound avoirdupois, 140,000 cubic feet of air will require—

$$\frac{140{,}000 \times 3\frac{1}{2}}{7{,}000} = 70 \text{ pounds of water per minute.}$$

The temperature of the water would probably be about 40°. This would have to be warmed up to a temperature of 65°, and be supplied in addition with the latent heat necessary to form it into vapor at that temperature.

To ascertain how much the air must be superheated for this purpose—

Let s = specific heat of air as compared with water = 0.2669
v = volume of air in cubic feet ..... = 140,000
w = weight of air in pounds per cubic feet .... = 0.075
t = temperature from which water is raised... = 40°
t' = temperature to which water is raised..... = 65°
l = latent heat of steam at that temperature.. = 1070°
W = weight of water to be absorbed in pounds. = 70°
x = number of degrees the air must be heated above 65°, in order that it may be at that temperature after it has dissolved the moisture.

Then,

$$\frac{W\,(l + t' - t)}{svw} = x = 27°$$

The temperature to which the air must be raised under the above conditions of the weather before it is moistened would, therefore, be—

$$65° + 27° = 92°$$

Now, to determine the extent of surface required for the warming tubes—

Let P = temperature of water in tubes.. = 192°
T = temperature of air after heating = 92°
t = temperature of external air.... = 20°
C = volume of air in cubic feet..... = 140,000
S = surface of tubes in square feet.

Then,

$$.0045\ C\ \frac{(P-t)\ (T-t)}{P-T} = S;\ \text{and}\ S = 78{,}000\ \text{square feet.}$$

In some seasons of the year there will be days when the external air will be all right as to the temperature, but will be deficint in moisture. In such event both the heating and moistening apparatus would have to be employed, as we have seen in the foregoing that the operation of moistening the air is a cooling one. When, however, the heat is a little in excess and the moisture correspondingly deficient, the moistening apparatus would serve both as a cooler and hydrator, and it is only when the weather happens to be in this exact state that the very prevalent idea that the air may be cooled by jets of water is applicable. When the air is too moist as well as too warm such jets would add greatly to the discomfort experienced. When the relative humidity is in excess in the external air and the temperature too low, merely heating the air may correct both difficulties. I would arrange indicators in the engine-room, such that the engineer would be able to see at all times the exact condition of the air in the halls as to temperature and moisture; and then I would so arrange the controlling valves of the entire apparatus that as he looked at the indicators he could add or remove moisture—elevate or depress the temperature at will, and at once.

When a person enters a building on a cold day in winter, especially if he has been riding, he will invariably repair to a fire to warm himself, if there is one. The most grateful fire one can enjoy under such circumstances, is one that presents a clear, cheerful blaze. Good, dry hickory wood in an open fire-place, having burned long enough to be in a glowing state of combustion throughout, is, I believe, every one's *beau ideal* of a pleasant fire. Such fires might be supplied to the cloak-rooms, but the objection to them would be the constant attention they would require to keep them always in full blaze. Anything less than that would be unsatisfactory, as, if a member came in nearly frozen, he would get warm by the general warmth of the hall before a fresh fire could be brought to the necessary heat-giving condition.

The gas fire-places which have been introduced into the residences of some of the wealthier citizens of New York, within the past three years, fulfill all the requirements of the case in the most complete and elegant manner. When not required the gas can be turned down to an ignition blaze, and the moment any one or more persons wish to enjoy an especial warmth they have only to turn on the gas, when there instantly occurs the most efficient and cheerful fire it is possible to imagine. I would place two of these in each of the cloak rooms.

III. COOLING AND DRYING THE AIR IN HOT WEATHER.

To reduce the temperature and moisture of the air of ventilation in the hot weather in summer is a much more expensive operation than warming and moistening it in cold weather. But, in the warm climate of Washington, the midsummer sessions are always dreaded by members of Congress. During the hot season of July, 1868, the House adjourned on two different occasions at an exceptionably early hour, because it was beyond the limits of physical endurance for the reporters to continue their labors longer in the fervid heat. Members were compelled to frequently leave their places and seek temporary relief in some breezy window. Some members, indeed, refrained entirely from appearing in their seats on those hot days. Of course, the oppression was much increased by the impurity of the air, owing to the faulty ventilation; but there can be no doubt that the comfort and health of the members can be greatly improved by cooling the air when it is so excessively hot, though it be pure and plentiful; and that those composing so important a body as the Congress of the United States should not be made uncomfortable and ill to an extent which every one recognizes as seriously interfering with the business they meet to perform, will, I think, be evident to all, even though the expense of reducing the temperature be greater than it has heretofore been customary to incur for any ventilating process. Some attempts have already been made in this direction, but, like all the features of the present system, the means employed were entirely inadequate to accomplish the end proposed. Thus, two tons of ice were melted in the air-duct leading to the hall of the House during each day, of about five hours—say, 800 pounds per hour. The quantity of air passing through the duct, with the blowing engine running at its usual speed of 42 revolutions per minute, as carefully measured by myself, was 24,300 cubic feet.

The temperature of the ice was, say ..... 25°
That of the water of condensation was, say ..... 60°
The latent heat of ice is ..... 140°

To determine how much the air would be cooled by melting ice—

Let t = temperature of the ice ..... = 25°
t' = temperature of the water of condensation ..... = 60°
l = latent heat of ice ..... = 140°
s = specific heat of air ..... = .2669
w = weight of air per cubic foot ..... = .075
v = volume of air in cubic feet ..... = 24,300
W = weight of ice melted per minute ..... = $13\frac{1}{3}$
x = number of degrees the air would be cooled by the melting of the ice.

Then,

$$\frac{W\,(l + t' - t)}{swv} = x = 4\tfrac{3}{4}°$$

As, however, the air thrown in by the present blower is mixed up with that which flows into the hall through the open doors, the temperature of the hall is only reduced about one degree by the melting ice.

The greatest absolute amount of moisture Dr. Wetherill found in the air at the Capitol in his experiments was 8.93 grains per cubic foot; and this was during the prevalence of a rain-storm. The temperature seldom rises above 95°, but it reaches that point often enough to establish the propriety of assuming that as the maximum.

If, now, we suppose the temperature to be 95°, and the moisture in the air at 9 grains per cubic foot, and we wish to reduce the temperature to 85° and not permit the relative humidity to rise above 85°, we must abstract 0.7 grain of water from each cubic foot;

Or,

$$\frac{140{,}000 + 0.7}{7{,}000} = 14 \text{ pounds},$$

from the whole quantity per minute.

At the moment of the condensation of this water from a vapor into a liquid its latent heat is given out into the air; so that removing the vapor is a warming process, as has already been shown that the addition of it is a cooling one. The additional extent which the air must be cooled to compensate for this latent heat of the vapor is expressed by the formula—

$$x = \frac{W\,l}{svw}.$$

Where W = the weight of water in pounds ..... = 14
l = latent heat of the vapor ..... = 1091°
s = specific heat of the air ..... = .2669
v = volume of air in cubic feet ..... = 140,000
w = weight of air per cubic foot ..... = 0.75
x = the number of degrees the air will be warmed by the condensation of the vapor.

With the above values $x = 6°$.

The entire cooling effect must therefore be equivalent to 16°. This would require 15,000 pounds of ice to be melted per hour, or, say, 37 tons per daily session of five hours.

Coal is cheaper than ice per ton, is more conveniently stored and handled, and one-sixth of the above quantity burned in the furnace of a steam-boiler will produce, through the medium of appropriate mechanism, an equal cooling effect upon the air. I would, therefore, discard the use of ice and employ steam power instead.

Machines are operated by the steam-engine for the manufacture of ice, which produce cold by the pumping off the vapor of sulphuric ether, or of the bisulphide of carbon; these liquids evaporizing rapidly at low temperatures, if the pressure of the superincumbent atmosphere be removed, but the employment of such substances would be inadmissible in cooling the air for ventilation, as a slight leak in even one of the many tubes it is necessary to employ in such mechanism would impair the purity of the air to a decidedly sensible and objectionable extent.

I would therefore employ the steam power to drive air-pumps to compress a portion of the air, making it hot, and while it was under this pressure, cool it down to the ordinary temperature by passing it through tubes surrounded by cold flowing water, employing an apparatus for this purpose precisely like the surface condenser of a steam-engine. This compressed air would then be conveyed to the duct through which the blowers were driving that which did not pass through the pumps, where it would be permitted to expand again to the ordinary atmospheric pressure. This expansion would be a cooling process exactly corresponding in extent to the heating one the air underwent when it was compressed, and by mixing this excessively cold air with the warm air from the blowers, the whole would be brought to the desired temperature.

It is mechanically convenient in a machine of this kind to compress two volumes of

air into one in the pumps. To learn how much such an amount of compression would elevate the temperature, a formula is given by Peclét in his Traité de La Chaleur, tome iii, p. 10, as follows:

Let θ = temperature before compression, (centigrade.)
d = density before compression.
θ' = temperature after compression.
d' = density after compression.

Then,

$$\theta' = (274 + \theta)\left(\frac{d'}{d}\right)^{0.42} - 274$$

In this case,

$\theta = 35°$ (= 95° Fahr.)
$d = 1$
$d' = 2$

and consequently,

$\theta = 139.44°$ cent., or 283° Fahr.,

and the elevation of the temperature would be 188° Fahr.

When air is heated in a confined space its pressure is increased $\frac{1}{480}$ part with each additional degree. The pressure of the atmosphere being 14.7 pounds per square inch, the pressure upon the pump pistons during the last half of the stroke would be—

$14.7 + (\frac{188}{480} \times 14.7) = 20.46$ pounds per square inch.

Let us say that we will maintain a pressure in our condensed-air cooler of 20 pounds per square inch.

To find how cold the air will be after its expansion, we have

$$\theta = \frac{\theta' + 274}{\left(\frac{d'}{d}\right)^{0.42}} - 274$$

The temperature of the Georgetown water during the hottest weather in summer is about 70°. As I would arrange the cooler so that there would be reverse currents of cold water and hot air, the latter would be cooled down to say 75°, which corresponds with 23.89° centigrade.

As the heat was abstracted from the air it would be further condensed $\frac{1}{480}$ part with the departure of each additional degree, the pressure being maintained; hence we would have

$\theta = 23.89$
$d = 1.$
$d' = \frac{14.7 + 20.}{14.7.} = 2.36$

Whence—

$\theta = -66.12°$ cent. or $-87°$ Fahr.

This would be a reduction from its original temperature of 182°. This being slightly more than ten times the amount of cooling force, it is necessary to apply to the whole quantity of air furnished one-tenth of that amount, or 14,000 cubic feet will require to be passed through the pumps. Allowing 10 per centum for loss, the dimensions of the air pumps will require to be as follows:

Number of pumps	2
Diameter of pistons	63 inches.
Stroke of pistons	6 feet.
Double strokes per minute	30

As the mean resisting pressure will be 12.4 pounds per square inch, the net power required to work them will be 900 horses. Allowing 10 per cent. for friction of engine and pumps, and we have 1,000 horses as the gross effective power of the engines. I would attach the steam and pump pistons to the same rods; with this arrangement the steam cylinders would have to be 45 inches diameter. I would employ a steam pressure of 40 pounds per square inch, and cut-off at one-fourth from the commencement. A surface condenser would be attached, and the mean gross effective steam pressure would be 29 pounds per square inch.

If the air was simply conveyed to the air duct and mixed with the warm air from the blowers, it would be cooled down below the desired temperature, and a portion of the moisture it is desirable to abstract would be condensed in the form of a fog and carried along with the air into the hall, which would thus be filled with a cold damp air, highly objectionable. It is necessary, therefore, to have the cold air introduced in a peculiar manner, such that not only may the moisture be abstracted, but that the exact amount removed may be subject of convenient and easy regulation by the engineer in the engine-room. The character of this regulation must necessarily be that the power exerted by the engine shall determine the extent of the cooling force, and that the

amount of this which shall be devoted to reducing the temperature of the air, and that which is devoted to abstracting the moisture, shall be subject to a regulating lever, or hand-wheel; so that if the engineer moves this in one direction the air will be made cooler and more moist, and if in the other it is made warmer and drier, the cooling engine continuing to run at the same rate.

To accomplish this I would erect in each of the cooling and drying chambers of the tempering ducts a congeries of tubes, somewhat similar to those employed for warming the air in cold weather, only I would have an additional chamber or chest at mid-height, so that there would be, in fact, two systems of tubes, one above the other; in other words it would be two stories high. Now, in the two upper chambers I would have openings in the bottom in all the spaces between the rows of tubes; these openings controlled by valves, and the valves appropriately connected with hand-levers, or wheels, in the engine-room; there being one for a system of valves which would control the openings in every third space between the rows, and one for the remaining spaces. The aggregate area of the openings in the lesser system should equal the area of the pipe which brings the compressed air from the cooling-engine; those in the other spaces, being of the same dimensions, would have in the aggregate twice this area. Then the compressed air should be conveyed by a pipe from a reservoir attached to the cooling-engine, to the lowest chamber; thence it would flow upward through the tubes into the upper chambers, then downward through the openings into the spaces between the tubes. The operation of this arrangement would be as follows:

Let us imagine a condition of the external air such as has been assumed for a maximum performance of the cooling-engine. In this case let the openings in two-thirds the spaces between the tubes be closed and those in the remaining spaces be wide open, the area of the whole being such that it would require a pressure of twenty pounds per square inch to drive all the air supplied through them. It will be perceived that the pressure throughout, from the pumps to the exit, will be 20 pounds per square inch, and that therefore the temperature will be maintained at 75° while the air passes through the tubes. As the compressed air pours down between the two rows of tubes and expands to the ordinary atmospheric pressure, its temperature will fall so suddenly that the moisture within it will be condensed and part of it frozen into minute hail. The main portion of the air from the blowers will pass through the remaining spaces between the tubes, and as they are only one-eighth of an inch apart in the rows, they form, in effect, walls of separation between the warm and the cold air. A sufficient quantity of the air from the blowers will, however, pass into the cooled spaces to carry forward the hail storm raging there, and as the hail and condensed moisture are carried along the narrow spaces they will come in contact with the surfaces of the tubes and be deposited upon them. The temperature of these will be too low to vaporize the moisture, but warm enough to melt the hail, and the water will run down them as it does along the sides of an ice pitcher, to the bottom tube sheet, whence it will pass off in proper drains prepared for it. With this arrangement one-third the moisture in the air may be removed when required by the lesser system of valves only being opened, and when less than this proportion requires removal, as will be almost universally the case, it can be governed with exactness by opening or closing more or less the remaining valves. As the air issues from the dryer it will be in vertical strata of cold, dry, and warm moist air, in the proper proportions, both with regard to temperature and moisture, to give the desired condition when they are mixed, which they will soon become as they pass along the duct. When, however, the external air is of the right temperature, or not much above it, but is so damp that it must be dried, the resulting temperature of the mixture will be too low, in which event it must be warmed up to the desired point as it passes through the heater. On the other hand, the external air may be so dry that when it is cooled down to the desired temperature it will still be too dry; when this occurs the moistening apparatus must be put in operation. Indeed, as has already been explained, it will sometimes happen that moistening the air will sufficiently cool it.

To enable the engineer in charge to control the condition of the air he delivered to the hall I would arrange pipes about three inches in diameter, and properly incased with a non-conductor of heat from the inlet duct and from the tempering ducts just beyond the moisteners, leading them through a convenient place in the engine-room for observation to the suction openings in the blowers, which would cause a rapid flow of air through them, having the exact condition existing at the other ends of the pipes. Into each of these pipes as they pass through the engine-room I would insert the wet and dry bulbs of a hygroscope, which should plainly indicate the temperature and degree of moisture in the air passing through the pipes.

The method here recommended for drying the air when it is too moist, or when it is made so by reducing its temperature, is simply the adoption upon a small but sufficient scale of that employed by nature in effecting similar changes of weather.

Dr. Metcalf, in his incomparable work on caloric, vol. i, p. 267, and following, describes and explains the influences exerted by the vapor of water upon the atmosphere and how it is added and removed. I quote from him as follows:

"As the phenomena of lightning have been universally known to be immediately

connected with the production of rain, it becomes necessary to ascertain with certainty the cause of evaporation and condensation before attempting to solve the problem of atmospheric electricity.

"That caloric is the true and only cause of evaporation, or the formation of steam, is one of those self-evident propositions which would seem to require no proof. But to remove all doubts upon the subject the fact has been experimentally demonstrated by Dr. Dalton, to whom the science of chemistry and meteorology is so largely indebted.

"He put a little water in a dry glass flask with a thermometer in it, when he found that a small quantity of vapor was formed at 32° Fahrenheit. At 40° the amount was increased; at 50° it contained still more vapor; while at 60° the quantity was yet further augmented. He also found that when the temperature of the flask was suddenly reduced from 60° to 40°, a portion of the vapor was converted into water, and that the quantity retaining the elastic form was precisely the same as when the temperature was originally at 40°.

"The above is a simple and beautiful representation of what is perpetually going on throughout the atmosphere and the steam-engine.

"By another series of admirable experiments he ascertained that the quantity of water evaporated in a given time was exactly in proportion to the elastic force of vapor at the same temperature, whether formed in vacuo or under the pressure of the atmosphere, with this difference, that in the latter case the process goes on much more slowly, because the atmosphere presents a mechanical impediment to its diffusion somewhat analogous to the obstruction of water by porous sand. From which he inferred that vapor is not chemically united with the air as has been formerly supposed, but mechanically diffused through it, forming a distinct atmosphere of its own, the elastic force of which is always in proportion to temperature.

"At 0° he found the elastic force of vapor equal to the pressure, .064 inch of mercury, that is, about one-fifteenth of an inch; at 32° it amounted to one-fifth of an inch; at 47° about one-third of an inch, or .339; at 59° .507, or one-half an inch; at 80° one inch; and at 90° 1.360. He also ascertained that the elastic force of vapor at 212° is equal to the pressure of the whole atmosphere, or 30 inches of mercury. (Manchester Memoirs, vol. v.)

"From the above experiments it follows that if the temperature of the earth were 80° from the equator to the poles, the quantity of vapor would be everywhere the same, and equal to about one-thirtieth of the average weight of the whole atmosphere; but that if its temperature were reduced from 80° to 59°, one-half the vapor would be precipitated in the form of rain; if to 32°, four-fifths of it would be converted into snow; and if reduced to 0°, 14 out of 15 parts of the whole would descend to the earth in the form of ice, in obedience to that universal law of nature by which bodies cohere and tend toward a common center.

* * * * * * * *

"If at the temperature of 80° the atmosphere contain an amount of vapor equal to the pressure of only half an inch of mercury, while it is capable of sustaining twice that quantity, it will require a reduction of temperature below 59° to cause precipitation. Hence it is that the atmosphere often undergoes great reductions of temperature without producing rain. But when the air is full of vapor the process of evaporation is arrested, which explains why a cold dry air is more favorable to evaporation than warm air that is already saturated, especially if the former be in a state of rapid motion.

"Dr. Dalton found that when boiling water was exposed to a current of air that carried off its vapor as fast as formed, vaporization went on a third faster than in a room where the air was still. Hence it is that the northeast and east winds, which in the west of Europe are generally dry, and far below the point of saturation, seldom condense the vapor of France and England; but, on the contrary, often redissolve the clouds already formed, producing clear weather. During summer, when the atmosphere has been for some time comparatively still, it is soon saturated with vapor, which is indicated by heavy dews, and the formation of clouds termed cumuli, in which case the weather becomes hot and sultry, because the caloric which is usually carried off by evaporation and winds accumulates on the surface of the earth, and heats the superincumbent air. Such a state of things generally forebodes an approaching thunderstorm.

"That the condensation of atmospheric vapor is owing to the abstraction of its caloric by colder currents of air is evident from the fact that in the tropical ocean far from land, where the trade-wind blows steadily in one direction, and where the temperature seldom varies more than two or three degrees, there is less rain than in the vicinity of the continents and large islands where currents of air of different temperatures frequently meet.

"In the great desert of Sahara there is scarcely any rain, because the wind blowing over it is generally in the same direction, while the vapor transported by it from the ocean is still further rarefied by the intense heat reflected from the scorching sands where there are no mountains to arrest its progress. There are also long droughts in

Egypt, Palestine, New Holland, and many other parts of the world, where the winds blow long in one direction without encountering colder currents. During summer in the United States the atmosphere is often so much heated that the vapor brought from the ocean by southern winds is not condensed for several weeks, and sometimes two months, but is further expanded until it becomes saturated, or meets with a current from the northern points of the compass, when thunder gusts follow.

"When I come to treat of winds it will be shown that the most extensive falls of rain in the middle latitudes are produced by the meeting of immense masses of air from opposite quarters of different temperatures, as during the equinoctial floods and storms. When both contain as much vapor as they can support at their respective temperatures, the amount of precipitation is of course the greatest.

* * * * * * *

"By a careful analysis of the phenomena, it becomes self-evident that, *if caloric be the true and only cause of evaporation, condensation and precipitation can be effected only by the evolution of the same agent.* During winter the quantity and elastic force of vapor in the atmosphere are comparatively low in the middle latitudes, where it is condensed gradually on meeting with colder air. During spring evaporation augments with increase of temperature, when masses of warm and cold air often meet, causing frequent showers of rain and sometimes of hail, still without much thunder and lightning. But during summer, when the temperature becomes tropical and the atmosphere saturated with highly elastic vapor, we have tremendous explosions of thunder and lightning, with rapid precipitations of rain and hail."

It appears conclusive from the foregoing remarks of the learned writer that the mechanical arrangement I have described for cooling and drying the air, when it is very hot and sultry, is only wanting in magnitude to produce a regular thunder-storm in the air duct. The electricity will probably be evolved in precisely the same manner that it is in the heavens when very cold and very warm currents of air are brought suddenly together, but it will be on so comparatively small a scale that the observable phenomena of the thunder-storm will not be apparent.

It is reasonable, however, to expect that the same pleasant effect would be had upon the air that a thunder-storm has, viz: to give it a peculiar freshness, as if it had been washed clean, and as if it possessed renewed vital powers, giving every one elastic spirits and additional life and strength.

Since the discovery of ozone by the late celebrated German chemist, Schoenbein, it is generally supposed that the electric fluid developed during thunder-storms gave that condition, in considerable degree, to the oxygen of the air, and that its delightful freshness and invigorating character, as experienced after a thunder-storm, were due to this cause, ozone being a condition of oxygen which causes it to enter into chemical union with other substances with greatly-increased avidity. When, therefore, we breathe air of which the oxygen is in this condition, or which is impregnated with this principle, it unites, with an increased readiness, with the carbon and hydrogen, which pass into it out of the blood through the membranes of the lungs.

There is also good reason to believe that cooling the air by first compressing it, as I have recommended, will have the effect of developing ozone. Dr. Wetherill states in his report, to which I have several times alluded, (p. 91,) that—

"M. Saint Pierre (Comptes-Rendus, 1, viii, 420, 1864,) discovered a remarkable production of ozone, by the action of certain kinds of ventilating apparatus. He found that test paper placed in the tuyere of a blast-furnace gave evidence of ozone in a much stronger manner than when in the external air. And to show that the velocity of the current, bringing greater quantities of the air to the paper, was not the cause of the reaction, he placed, at the same time, similar papers upon the governor of a steam-engine in a saw-mill. From these, and other experiments, he concludes that the reaction arises from compressing the air."

Whether this desirable condition of the air would be imparted to it by the mechanism described, or not, there can be no doubt but the temperature and moisture of the external air could be modified, by the system I have recommended, from its most unpleasant condition, in any season of the year, to that which is most delightful, and without imparting to it any impurities or unpleasant odors.

To supply the necessary quantity of steam to the blowing and cooling engines, and for warming the air in cold weather, I would provide three boilers, the aggregate potential dimensions of which would be as follows:

	Square feet.
Grate surface	135
Heating surface	6,750
Calorimeter through tubes	27

COST.

I have carefully ascertained how much it will cost to carry out the foregoing programme, and, although it amounts to a larger sum, in the aggregate, than I find contemplated in any of the various reports which have been made on this subject, it is

very much less than was expended by the British House of Commons upon improving the ventilation of their hall, though it has the addition of the cooling and drying apparatus, the cost of which is a material addition to the expense; and, moreover, draws its air from an unobjectionable locality, while the air for the House of Commons is drawn through the side windows of the basement story, which, on one side overlook the court-yard where the carriages come for the members. The smell, as of an unclean stable, became so offensive that orders had to be issued that horses should not stand there when waiting. On the other side the windows overlook the Thames, and orders had to be issued in this direction against the passage, near the building, of barges filled with offal. I do not know the exact amount they have expended, but the following extract from the evidence of the Hon. E. P. Bouverie, M. P., a member of the House committee on ventilation, before a committee of the House of Lords, May 12, 1854, will give an idea of it:

"Question 762. Do you not think that Mr. Gurney's improvement in the ventilation of the house is mainly attributable to the windows being open?

"Answer. I have heard it said that the result of our spending £200,000 in the ventilation of the House of Commons has been to prove that the best way of ventilating the room is by opening the windows. We sit in the house a good many hours after the windows are shut; for instance, we did so last night, and the air, I think, remains very fresh and good."

Here is an expenditure of $1,000,000, in gold, with labor and materials so much cheaper than in this country that it would require $2,000,000 of our present currency to effect the same work here now, and even then they had not arrived at a fully satisfactory condition of their hall, as they made several changes subsequent to the above date.

The whole cost of the Capitol building, up to the present time, is about $12,000,000, and it is correspondingly grand in its conception and beautiful in its detail. The materials are of the highest order ever employed in building, and they are brought together with an exquisite taste and skill, which is probably unsurpassed in any edifice in the world.

The new wings are so arranged that mechanical ventilation is the only proper method, and that was adopted and is now in use. But the mechanism is utterly inadequate in its dimensions and power, is arranged upon erroneous principles, and is faulty in every detail of its design. It propels a feeble current of air up through the door of the halls near the western ends, which current continues upward and out through the ceilings, without having done much to ventilate anybody. In winter it is heated by rusty iron steam-pipes, without being moistened, and in summer the little ventilation there is may be said to depend upon the open doors.

Such a system in such an edifice is simply disgraceful. How much honor is reflected upon the nation by imposing colonnaded façades of purest marble; by grand corridors with tessellated floors, bronze doors, and frescoed walls; by great dimensions, or gorgeous gildings, and other ornaments, if the whole is kept filled with a mephitic atmosphere by a defective and deficient ventilating mechanism?

The conception of the ventilation of such an edifice should be as complete and superior in its character, as a scientific and mechanical work, as the building itself is as an architectural one.

The mechanism should be indebted for the principles which govern its arrangement and operation to a correct application of known physical laws. It should be scientifically proportioned throughout all its detail, that it might correspond with the building and with the work it had to perform.

Each part should represent the highest skill in the arts to which it pertains in its design, its material, and its workmanship and finish.

As in carrying into execution the plan I now propose, the Architect of the Capitol will be called upon to erect a ventilating house, in which to place the necessary machinery and apparatus, it would be entirely within his province to excavate for and construct underground air-ducts and to reconstruct air-ducts within the building. I would therefore confine myself to furnishing the following, which I will do at the prices named opposite each item, to wit:

One pair of surface-condensing engines of 250 horse-power, for driving blowers, with wood gear fly-wheel; all erected in place complete	$17,630
Four blowers for the House of Representatives, each having a capacity of 80,000 cubic feet per minute. Four blowers for the Senate, each having a capacity of 60,000 cubic feet per minute, with shafting, hangers, gearing, pullies, belts, &c., all erected in place complete	13,200
One pair of surface-condensing engines, of 1,000 horse-power, and connected thereto a pair of compressing air-pumps of sufficient dimensions to absorb the above power when compressing air to a pressure of 20 pounds per square inch above the atmosphere, and connected with these pumps a tubular compressed air-cooler, having 3,000 square feet of brass tube surface, all erected in place complete for cooling and drying the air in hot weather	108,000

Drying apparatus, having 7,750 square feet of block-tin tubular surface, with regulating valves complete, for renewing the moisture from the air when it is too damp, or when it is made so by having cooled it, all erected in place..	$49,170
Heating apparatus, having 78,000 square feet of block-tin tubular surface, with steam and water-pipes, and valves complete, all erected in place.....	246,000
Three boilers and their appurtenances, having in the aggregate 135 square feet of grate surface, and 6,750 square feet of fire surface, and capable of generating steam for 1,250 horse-power, and of sustaining a working pressure of 50 pounds per square inch above the atmosphere, all set in place complete, with copper steam-pipes to engines.....	36,370
Moistening apparatus, made entirely of block-tin pipes, and equivalent to 70,000 square feet of pan surface, all erected in place, with valves, &c., complete.....	11,580
Extra ceilings of plate glass and iron of double thickness, extending over the entire halls; rearranging the gas fixtures over new ceilings; perforating the ceiling for the passage of the air into the halls, and supplying wire-screen deflectors to distribute the air equally over all parts of the ceilings; all complete and in place.....	128,300
Wire-gauze fitted to backs of seats in galleries for passage of foul air through floors of galleries, perforated plates fitted to cornice of front of galleries for passage of foul air, and to prevent the exhalations of persons leaning over it from passing down to Senators and members on the floors of the halls, and additional registers in the floors of the halls so that there shall be at least one to each desk.....	19,910
Sixteen gas fire-places, with marble mantles complete, in the cloak-rooms; new registers in cloak and committee rooms and corridors.....	19,000
Indicating air-pipes, hygroscopes, Hotwell thermometers, steam cylinder indicators and fixtures, engine counters and clock for engine room.....	4,880

RECAPITULATION.

Blowing-engines.....	$17,630
Blowers.....	13,200
Cooling-engines.....	108,000
Drying apparatus.....	49,170
Heating apparatus.....	246,000
Boilers.....	36,370
Moistening apparatus.....	11,580
Extra ceilings, &c.....	128,300
Wire-gauze, registers, &c.....	19,910
Gas fire-places, &c.....	19,000
Instruments.....	4,880
Total.....	654,040

The work remaining to be done by the Architect will be as follows:

First. The construction of a suitable ventilating house in the western park for the reception of all the boilers, engines, blowers, heaters, dryers, moisteners, &c. It should be 75 feet long by 50 feet wide, have two stories and a basement. The blowing-engines, cooling-engines, and the blowers would occupy the ground floor; the dryers, heaters, and moisteners the upper story; and the coal and boilers the basement. The boilers themselves would be placed in a recess on one side 30 feet wide by 36 feet long, so as to be under a pavement only, that, in case of an explosion, the building and the machinery within it might not be injured. The upper story of this building will contain four temporary air-ducts extending longitudinally the entire length, and 8 feet wide in the clear. It is in these that the heaters, &c., will be placed, the air being driven up from the blowers into one end and escaping into the supply air-ducts at the other. Each story, and the basement of this building, should have a height in the clear of not less than 15 feet. On the top of the building there should be a tower at each end, to serve as inlet-ducts. They should each have a cross area of 40 square feet. The height of these towers may be such as to render them visible or not, as the Architect may elect.

Second. The construction of air-ducts from the ventilating house to the space above the ceiling, at each end of each wing, making four ducts for the conveyance of pure air, one from each tempering chamber. Each of these ducts must have a cross area of 20 square feet in the direction of the House of Representatives, and 15 square feet in the direction of the Senate, and must be distinct from each other during their whole length.

Third. The conversion of the space beneath the floor of the halls into one chamber, it being now a complicated system of air-ducts.

Fourth. The construction of air-ducts from each end of each of these chambers to the ventilating house, making four ducts for foul air, each one will communicate with an exhaust blower. These foul-air ducts must be of the same dimensions as those which convey the pure air, and must also be kept distinct from each other during their whole length.

Fifth. The construction of a foul-air and smoke conduit from the ventilating house to the base of a chimney which shall be situated without the grounds. This conduit must have a cross area of 96 square feet. I would introduce the smoke from the boilers to the center of this conduit, and thus the foul air from the blowers would act upon it in the manner of the syphon ejector, and maintain a force draught through the boilers, which will insure their invariable efficiency. In the construction of all these air-ducts it is important that the areas be not contracted at any part, because the power required to furnish a given quantity of air in a given time must be doubled if the velocity is doubled, and I have computed the power required upon the basis of the areas above given. It is also important that when the direction is changed, it should, for obvious reasons, be curved as much as the circumstances will permit. Those ducts which convey the pure air upward within the buildings may, in the south wings, be situated back of the grand stairways. In the north wing they should occupy the southwest and southeast corners of the wing. The foul-air ducts can occupy at the western side the same position as the present pure-air ducts, and on the eastern side similar ones can be provided.

Sixth. The construction of a chimney in some locality out of the grounds, having a cross area of 96 square feet.

Seventh. Introducing a Potomac water-pipe, of not less than six inches internal diameter, into the ventilating house, and providing a drain of equal capacity from the building.

The foregoing work, executed in a thorough, first-class manner throughout, will result in a ventilation of the Capitol which will elevate it to the position of being the grandest public building in the world.

The peculiar feature of having the halls surrounded with inclosed corridors, now so generally condemned, will be appreciated for its convenience, and for the very fact of the impossibility of any interference of the weather on the outside with the delightful air which will be constantly maintained within. It is only occasionally that nature gives us the pleasantest condition of the atmosphere for weather, and when she does, how everybody salutes his friend by reference to the charming day! How thoroughly we all appreciate it! How it elevates the spirits and invigorates the health! What I propose is to make the weather within the building charming all the time.

ACOUSTICS.

There will be another feature of marked superiority developed by the adoption of this plan of ventilation, and that is, the acoustic properties of the two halls. These are now very bad and are justly condemned, though I do not consider that the fault lies in the architecture. Indeed, few halls are so well designed in this respect.

In a hall where each of the audience becomes in turn a speaker, it is essential that dependence for audibility shall rest entirely upon the direct transmission of the sound from the mouth of the speaker to the farthest listener. If the speaker were always to occupy a given position, then the walls and ceilings could be so constructed in regard to form and materials that the sound would be reflected in a manner to assist the direct force of the voice, but this is impossible where the speaker may occupy any part of the floor; and in such case, care must be taken that there are no reflections of the sound, as, except the various reflected rays and the direct rays of sound arrive at the ear of the listener at about the same time, it causes confusion and fatigues the listener. These appear to have been the ideas of the architect when he designed the halls. The trouble now is the imperfect transmission of this direct ray of sound from the speaker to the listener.

When it is remembered that sound is transmitted by verberations of the air, it is easy to understand that currents moving in different directions about the halls, or inequalities in the temperature and consequent density of the air in different parts, through all which the waves of sound must pass, would so disturb such waves that by the time they reached the ear of the distant listener they would be greatly broken and neutralized, and the clear, distinct articulations uttered by the speaker would in consequence be so jumbled and mixed up that what he is saying can only be determined with difficulty.

In the system of ventilation I propose, the air enters through all parts of the ceiling with uniform force, and by the time it has descended ten or fifteen feet it has become a tranquil stream, slowly descending in a quiet mass. When a speaker sends his voice through this quiet air, the waves of sound will cross the entire hall without being broken or confused, and the utterances of the speaker will be conveyed intact to the ear of the listener, mellowed and softened only by distance.

Throw a pebble on a calm day into the middle of a deep flowing river having a slow current,and you will see the waves from it preserve their circular form and their distinctness until they are broken on the banks, but let a breeze ruffle the surface of the water, or let rocks beneath disturb the current, and the waves from your pebble will extend but a short distance from their source before they will be broken up and disappear; and so it is with the passage of sound through the air; eddies and counter-currents interfere at once with it, and unless it is more powerful than these disturbing causes it is destroyed in a short distance. As now ventilated, every speaker must pitch his voice much higher and give it much more force, and every listener must give more careful attention to what is being said, than will be necessary if my plans are executed. Indeed I feel confident that all complants against the acoustic properties of the halls would cease at once this went into operation.

PROPOSAL.

I am prepared to enter into contract and furnish satisfactory sureties to execute the foregoing work in full accordance with the letter and spirit of this proposition for the hereinbefore said sum of $654,040, in eighteen months' time; payments 5 per cent. of the contract price monthly during the progress of the work, until 87½ per cent. shall have been paid, the final 12½ per cent. to remain unpaid until August 1st, 1872, when it shall be paid in full unless a resolution shall have passed Congress to the effect that the work is unsatisfactory.

I am, very respectfully, your obedient servant,

ALBAN C. STIMERS.

Hon. JAMES W. NYE,
Chairman Joint Select Commtitee on Ventilation and Acoustics.

OFFICE OF ALBAN C. STIMERS, NAVAL ENGINEER,
No. 45 William Street, New York, May 2, 1870.

DEAR SIR: Agreeably to your request that I would suggest such a course of experiments as would determine with scientific accuracy the exact character of the present ventilation of the halls of Congress, I beg leave respectfully to offer the following:

The theory of the present system is, that a sufficient supply of fresh air is forced into the halls through the floors by means of fan blowers in the sub-basements driven by steam-engines; the air from these blowers passing through single main ducts to the height of the floors, and then distributed throughout the area of the halls by smaller ducts, leading in different directions to all parts, the air rising from them through registers placed in the floors. From these registers the air is supposed to rise vertically, ventilating the people as it ascends to the ceilings, which are perforated for its egress.

Now, *if* the quantity of air supplied by the blowers was ample; *if* it was equally distributed throughout the floors and galleries of the halls; and *if* it rose vertically from each point of ingress to the perforated ceiling, there could not exist the foulness now so evident in certain parts of the halls. I would therefore recommend that the following facts be determined:

1st. The gross quantity supplied by the blowers.
2d. The per centum of this quantity which enters at each register.
3d. The direction the air takes from each register.
4th. How long it takes the air from each register to reach the ceiling.
5th. The condition, as to foulness, of various parts of the halls and galleries.

The foregoing should be ascertained with different conditions of use, such as when there are many people and when there are few, and indeed when there are none; when the doors are kept open above and below, and when they are kept shut; when the doors are kept open on a calm day and when on a breezy one. Such a series, well conducted, would, I think, give a very clear indication of the causes of complaint and would explain the acoustic difficulties as well.

To arrive at the velocity and direction of currents, I would employ toy balloons. By attaching to each one an open envelope it will be convenient to weight this with sand until the specific gravity exactly corresponds with that of the air, and the envelope can be marked with a number, or otherwise, for its identification. By placing one of these over a register it will pass with the air to wherever this flows, lodging finally at the point of egress. By starting a number of these at the same time from various parts of the floors and galleries, a very striking impression would be made to all observers as to the currents going on within the chambers.

For a proper scientific record, however, there should be only one at a time, or not more than can be accurately watched by special observers. These should be properly stationed, with diagrams of the chambers before them, and should mark on these dia-

grams the course of the balloons, marking the positions they occupied at the end of each minute. From these, general diagrams could be drawn which would indicate the currents under the different circumstances obtaining at the times of the observations.

To determine the per centum of the whole quantity of air which should enter at any given point, I would start a balloon at the register and note the time of its passage through a given short distance, say two feet, and multiplying the velocity thus found by the area of the openings in the register, the amount admitted there would be found. To measure with accuracy the short periods of time this would require, I would employ a clock which was provided with a moving strip of paper, the paper moving with a given known velocity, say two inches per second; a pointer held down upon this with the finger, during the desired period of observation, would make a mark on the paper the length of which could be accurately measured. Such a clock would cost not exceeding $60.

To determine the foulness of the air at various points of the floors and galleries, I would do it by determining the amount of moisture of each point, and compare this with that contained in the inflowing air.

The average man requires 6 cubic feet of air per minute to absorb the moisture which emanates from him, while he only requires one-quarter of a cubic foot to absorb the carbonic acid gas of the breath.

Moreover, the carbonic acid gas in the exhaled breath is not the cause of foul smells, but the moisture which emanates from the person is loaded with worn-out animal matter, which, though not immediately offensive, if from a clean, healthy person, soon becomes so. To measure the additional amount of moisture at any given point is, therefore, to determine the foulness of the air at the same point. This can be done by the careful use of hygrodeiks, which can be placed upon the desks of members and on the seats in the galleries. These cost $15 each, and a dozen of them would suffice.

The toy balloons are prepared every morning here in New York by persons who gain a livelihood by selling them on our streets in the afternoon. People buy them for the amusement of their children on their way home. It will be necessary to carry a man with his apparatus to Washington, as they have to be refilled every morning, the gas always oozing out in a few hours. The expense of these would be small, the man being employed as an assistant.

I think the foregoing, properly executed and reported upon, the report illustrated with the diagrams indicated, would add a fund to our information on this subject, the value of which would exceed its cost many times over, as whatever may be accomplished by heating, cooling, moistening, and drying the air of ventilation by superior methods, it avails nothing unless the air is *constantly renewed in every part of the vast halls.*

I would recommend that the committee appoint a competent person to carry out the entire programme and report to it the results obtained.

I am, very respectfully, your obedient servant,

ALBAN C. STIMERS.

Hon. THOS. A. JENCKES, M. C.,
House of Representatives, Washington, D. C.

MR. LUTHER ROBINSON'S PLAN FOR VENTILATING THE WINGS OF THE UNITED STATES CAPITOL.

No. 46 CONGRESS STREET, BOSTON, *June* 10, 1870.

To the Congressional Committee on Ventilation, Washington:

GENTLEMEN: The failure of most attempts to secure the satisfactory ventilation of buildings clearly proves that they have been made without regard to the true principles, on the right application of which, alone, success depends.

All simply "ejecting" plans, with or without the aid of heat, are wrong in theory; and are, therefore, as proved by universal experience, inefficient and unsatisfactory in practice; and all forcing plans are costly, for machinery, power, and care, even if excellent results *can* be secured, and, as to results, I have seen many cases of failure, and none of marked success.

The philosophical reasons for their failure it is easy but not necessary now to state.

It is not my present purpose to write a general essay on ventilation, nor to correct, describe, or discuss, unless briefly and and incidentally, the various theories on this subject, nor even to recall to your minds the several interesting collateral questions often and properly discussed in this connection, presuming all these to be as familiar to the committee as to myself.

My purpose is, rather, to propose a definite *practical* plan for securing, *beyond the possibility of failure*, a highly satisfactory condition of the atmosphere in the legislative halls in the Capitol in Washington.

After full and careful study of the philosophy, operation, and results of all systems

in use in this country, and with an experience in ventilating many hundreds of buildings, small and large, with the most complete success, without an approach to a failure—in the last six years, at least—I can speak on this subject with the confidence of knowledge not merely theoretical.

I have fully considered the construction and circumstances of your legislative halls, and know precisely what is needful to make their atmosphere constantly fresh and comfortable, and shall offer to ventilate one or both of them, in accordance with the general plan herein indicated, executing all mechanical work in style and manner entirely satisfactory to the committee, after examination; also, SECURING and WARRANTING *results* entirely satisfactory after a reasonable trial, on terms to be named in separate, more detailed specifications and proposals, soon to be made.

The proper ventilation of the Capitol, as of other buildings, requires the furnishing of an abundant supply of fresh air, its proper distribution, and the effectual removal of air from the building.

By the system of ventilation which I have orally explained to you, all of these objects are satisfactorily accomplished.

Beyond all doubt, fresh air is furnished, and impure air efficiently removed, and, with proper skill in the application of the system, without annoyance from currents.

To the roofs of buildings we apply structures of iron or other material—*ventilators*, of peculiar construction, having mouths open in every direction, subdivided by several partitions, with tubes, straight or angular, long or short, as needful, subdivided to correspond with the divisions of the ventilators, extending through the upper portion of the building, and reaching proper points in the ceiling of the room to be ventilated. We thus establish communication, through numerous passages, between the room and the external air.

Through these ventilators and connecting tubes *alternating currents of air pass.* Through some of them fresh air passes in, and is properly distributed, while through others impure air passes out, securing thus the real, efficient, quiet change of air, which constitutes good ventilation.

This is not theory, but fact, easily ascertained by intelligent examination of any one of the thousands of these ventilators already in use; and the results of the change are manifest to the most casual observer.

Over the Capitol, and within ten feet of its roof, an abundance of air passes, every day in the year, to ventilate, even excessively, more than a score of such buildings. It moves with a momentum varying with its velocity, but ever sufficient for our purpose.

We use this undoubted "power of the air" as one of two forces to accomplish our end. Whatever its velocity or direction, it presses against some face and into some mouth or mouths of these ventilators, and is conducted through some of the tubes to the room, as surely as water and illuminating gas, under pressure, are driven through their pipes to distant points for convenient use.

The necessary consequence of this influx of air is condensation, if the room is tight, or exit if not tight. But with the construction described there *can* be no condensation, as some faces under the lee must be less pressed than those against which the wind blows, allowing easy exit to the air driven out in consequence of the entrance of air on the opposite side.

This operation is visible to all who, on a frosty day, pass any of the three hundred drying and dressing rooms on which these ventilators are used.

From three rooms of this class, under control of members of present Congress, moisture enough has already been removed to form, when condensed, not less than forty thousand barrels of water.

The ordinary heat of a room, from whatever source derived, acts as another motive force, establishing and keeping up this same alternation of currents, even without the aid of wind.

Heat drives air through some of these passages, and not through all of them, while external air, even by its weight alone, falls in to supply its place.

This is a demonstrable *fact*, which no argument can make more plain, nor any theorist disprove.

Thus, considering the impure air of a room simply as matter, subject solely to the laws of force, moving only as *moved*, we have at our command, and through these structures use, as forces, *wind and heat*, acting efficiently, separately or concurrently, effecting the desired change of air.

We thus provide for the efficient and quiet ventilation of any building, at all times, unless in the extremely rare but theoretically possible case of the failure of both forces.

But if, by respiration and radiation the temperature of the air is not increased, and if, at the same time, there is no appreciable movement of the external air, it is perfectly safe, and may add to comfort, to open all doors and windows.

Providing, as we do, for all cases in which it is desirable to close them because of the discomfort due to cold air or to currents; securing, as we do, at all such times, results closely bordering on perfection: we need not be too solicitous in regard to a possibl

conjuncture of conditions which may not exist during a single hour in a year, and for which provision can be made *only*, EVEN IF, by the use of a "mechanical power," already at your command.

Our ventilators standing on the roof, so low as not to be conspicuous from the ground, should be sufficiently large and numerous to correspond to the wants of the largest audience; only a portion of them being in use when the audience is small.

The tubes or boxes in the attic would need to be very large and complicated, extending over the entire galleries on all sides of the halls.

The ceiling over these galleries is very open, affording all or nearly all of the needed space.

In the ceiling of the Senate chamber no change would be needed, and in that of the House only an enlargement of the openings at about 200 points, between the brackets, next to the walls on all sides of the hall—a change not noticed unless on close inspection.

All of these *pores* in the ceiling would be used for the actual passage of the incoming and outgoing air.

They are admirably arranged for its proper distribution, in streams mild as the gentlest shower, the rising vapor, or the falling snow.

The halls might almost be said to breathe, taking in the good and expelling the bad air. If all breathe in unison, the halls as fast as the audience, as they may, nothing better can be required. Let the carbonic acid, observant of fundamental law, float into the outer air, as it will, all authorities and all theories "to the contrary notwithstanding," and we need have no fear that vegetation will fail to perform its work, and make the needful restoration.

From this "carbonic acid question," on which no darkness needs to rest, it would afford me pleasure, if time allowed, to brush the mists and myths with which false teaching has surrounded it.

Orally, I often discuss it in full, and shall be pleased *thus* to give to the committee, if they desire, the facts and the law of the case.

Not merely these large halls, but their surroundings also can be vastly improved.

Over each stairway, besides the glass, is a very extensive porous ceiling.

All of this open space I would convert into immense respirators, our large, complex, and very angular boxes covering the whole, and connecting it with *giant* ventilators standing on the roof over the passages at the head of the stairs.

Through our ventilators and boxes thus arranged, injection *and* ejection will be effectually accomplished, securing throughout the stairways and connecting passages a state of freshness hitherto unknown, and not attainable, unless at enormous cost, by any other known plan.

All the rooms opening into these passages, especially those above the first story, will be improved in condition; and most or all of those occupied by a few persons may be sufficiently ventilated by the frequent opening of doors, allowing direct communication with a reservoir of fresh and constantly changing air.

There can be no doubt as to the operation and results above indicated, as I have at least a score of successful similar cases.

The effect, I have no doubt, will be appreciable even below the level of the floor of the legislative halls, but in all the space above that level it cannot fail to be most. marked.

These ventilators should be so large that if 3,000 persons should occupy the stairways and passages in each wing, with all doors and windows closed, there would be no suffering for want of pure air.

This arrangement alone would be of vast benefit to the occupants of the legislative halls, especially when the audience is large, as all the doors from the halls would be likely to be then open.

Such, gentlemen, is the general plan which I shall offer to apply to the wings of the Capitol.

Its universal success, wherever properly applied, is an index of what we may expect in the future.

In the House, a few weeks since, reference was made to the discomfort due to heat from the burning of gas above the ceiling.

A plan for securing almost complete protection from that annoyance can be easily applied.

Very respectfully,

LUTHER ROBINSON,
Agent of U. S. Ventilation Co., of Boston.

---

46 CONGRESS STREET, BOSTON, *May* 5, 1870.

DEAR SIR: As your committee have the money appropriated for experimenting, would not it be well to use a part of it in the actual ventilation of some room, so that results

can be seen and appreciated? The court room in which Surratt was tried, the common council room, all school rooms, &c., greatly need ventilation. That court room I could ventilate probably for $500 or less, so that two hundred men could not "smoke it out," or make much bacon there, and all would be right for permanent use.

If your committee would like to let me use up a part of the money I think I can show them highly satisfactory results.

I hardly had time to say to you that the annoyance mentioned in the discussion, of excessive heat from the gas, can be vastly diminished at small cost, and within a few days. I have no time now to explain details.

Yours, truly,

L. ROBINSON.

Hon. T. A. JENCKES.

WASHINGTON, *June* 23, 1870.

To the congressional Committee on Ventilation:

GENTLEMEN: I offer to apply to the southern wing of the Capitol the system of ventilation already described, using for the stairways two nicely constructed ventilators of wood, not less than 6 feet square, and for the hall of the House two of the same size and style; also six of galvanized iron, 3 feet square, all well made, painted, and strongly fastened to the roof. The interior tubes or boxes connected with them to extend over the ceiling of the entire galleries and the iron ceiling over each stairway, but not intercepting the light over the stairs. To protect the boxes in the attic from the effects of heat, their exterior to be lathed and plastered. Proper valves to be arranged with cords extending to some convenient point, as the stairway leading to the attic. All mechanical work to be properly done, to the satisfaction of the committee, or such agent as they may appoint. The amount of ventilation thus proposed for the hall, independent of the indirect effects from ventilating the stairways and passages, being more than three times as great as I have ever applied for two thousand persons, cannot fail to be abundant for any audience. Indeed, under ordinary circumstances only a small portion of the entire efficiency would need to be used.

I have had much opportunity to study the effect of heat as transmitted through roofs, windows, walls, &c., and in several instances have caused valuable remedies to be applied.

When the lights are burning in the attic the temperature, I am told, is from 180° to 200°. If the ceiling were tight and covered with water at nearly a boiling temperature there would be no doubt as to the communication of an uncomfortable heat to the air below. From the great heat of the air in the attic, the glass and iron of the ceiling afford no sufficient protection. The obvious remedies are to ventilate the attic more efficiently, and to protect the ceiling from contact with hot air by covering the whole with good non-conductors.

If our plan of ventilation should be applied, as proposed, all of the ceiling over the galleries would be abundantly protected. The other portion of the ceiling, except the glass, should be covered with some non-conductor, as shavings from a planing-mill, and a tight floor, on proper frame work, laid over the whole; or, above this part of the ceiling there might be two floors, with intervening closed air spaces, affording almost complete protection from the heat above this portion of the ceiling.

Over the glass I would propose to place additional sashes fitted with two panes of white glass in each panel. Make all tight around the old sashes, and there would be between the heads of members and the hot air above three plates of glass and two intervening masses of confined air, and the annoyance from this source will be reduced to a minimum.

My proposal will include—

1. The ventilation of the stairways and passages, as described.
2. The direct ventilation of the Representatives' hall, as described.
3. The more efficient ventilation of the attic, as I may deem expedient.
4. The better protection of members from heat from the gas, on the plan above described.

The total expense of all these improvements I estimate at $30,000.

I am ready to execute the whole in proper style for the sum named, one-half to be paid on completion of the mechanical work described prior to the middle of November next, to the satisfaction of the committee or of their agent, if one shall be appointed; and the other half after a reasonable trial of the system and the securing of satisfactory results.

The Senate chamber, being smaller, would require arrangements less extensive. This wing I could ventilate satisfactorily and furnish similar protection to the ceiling for $20,000.

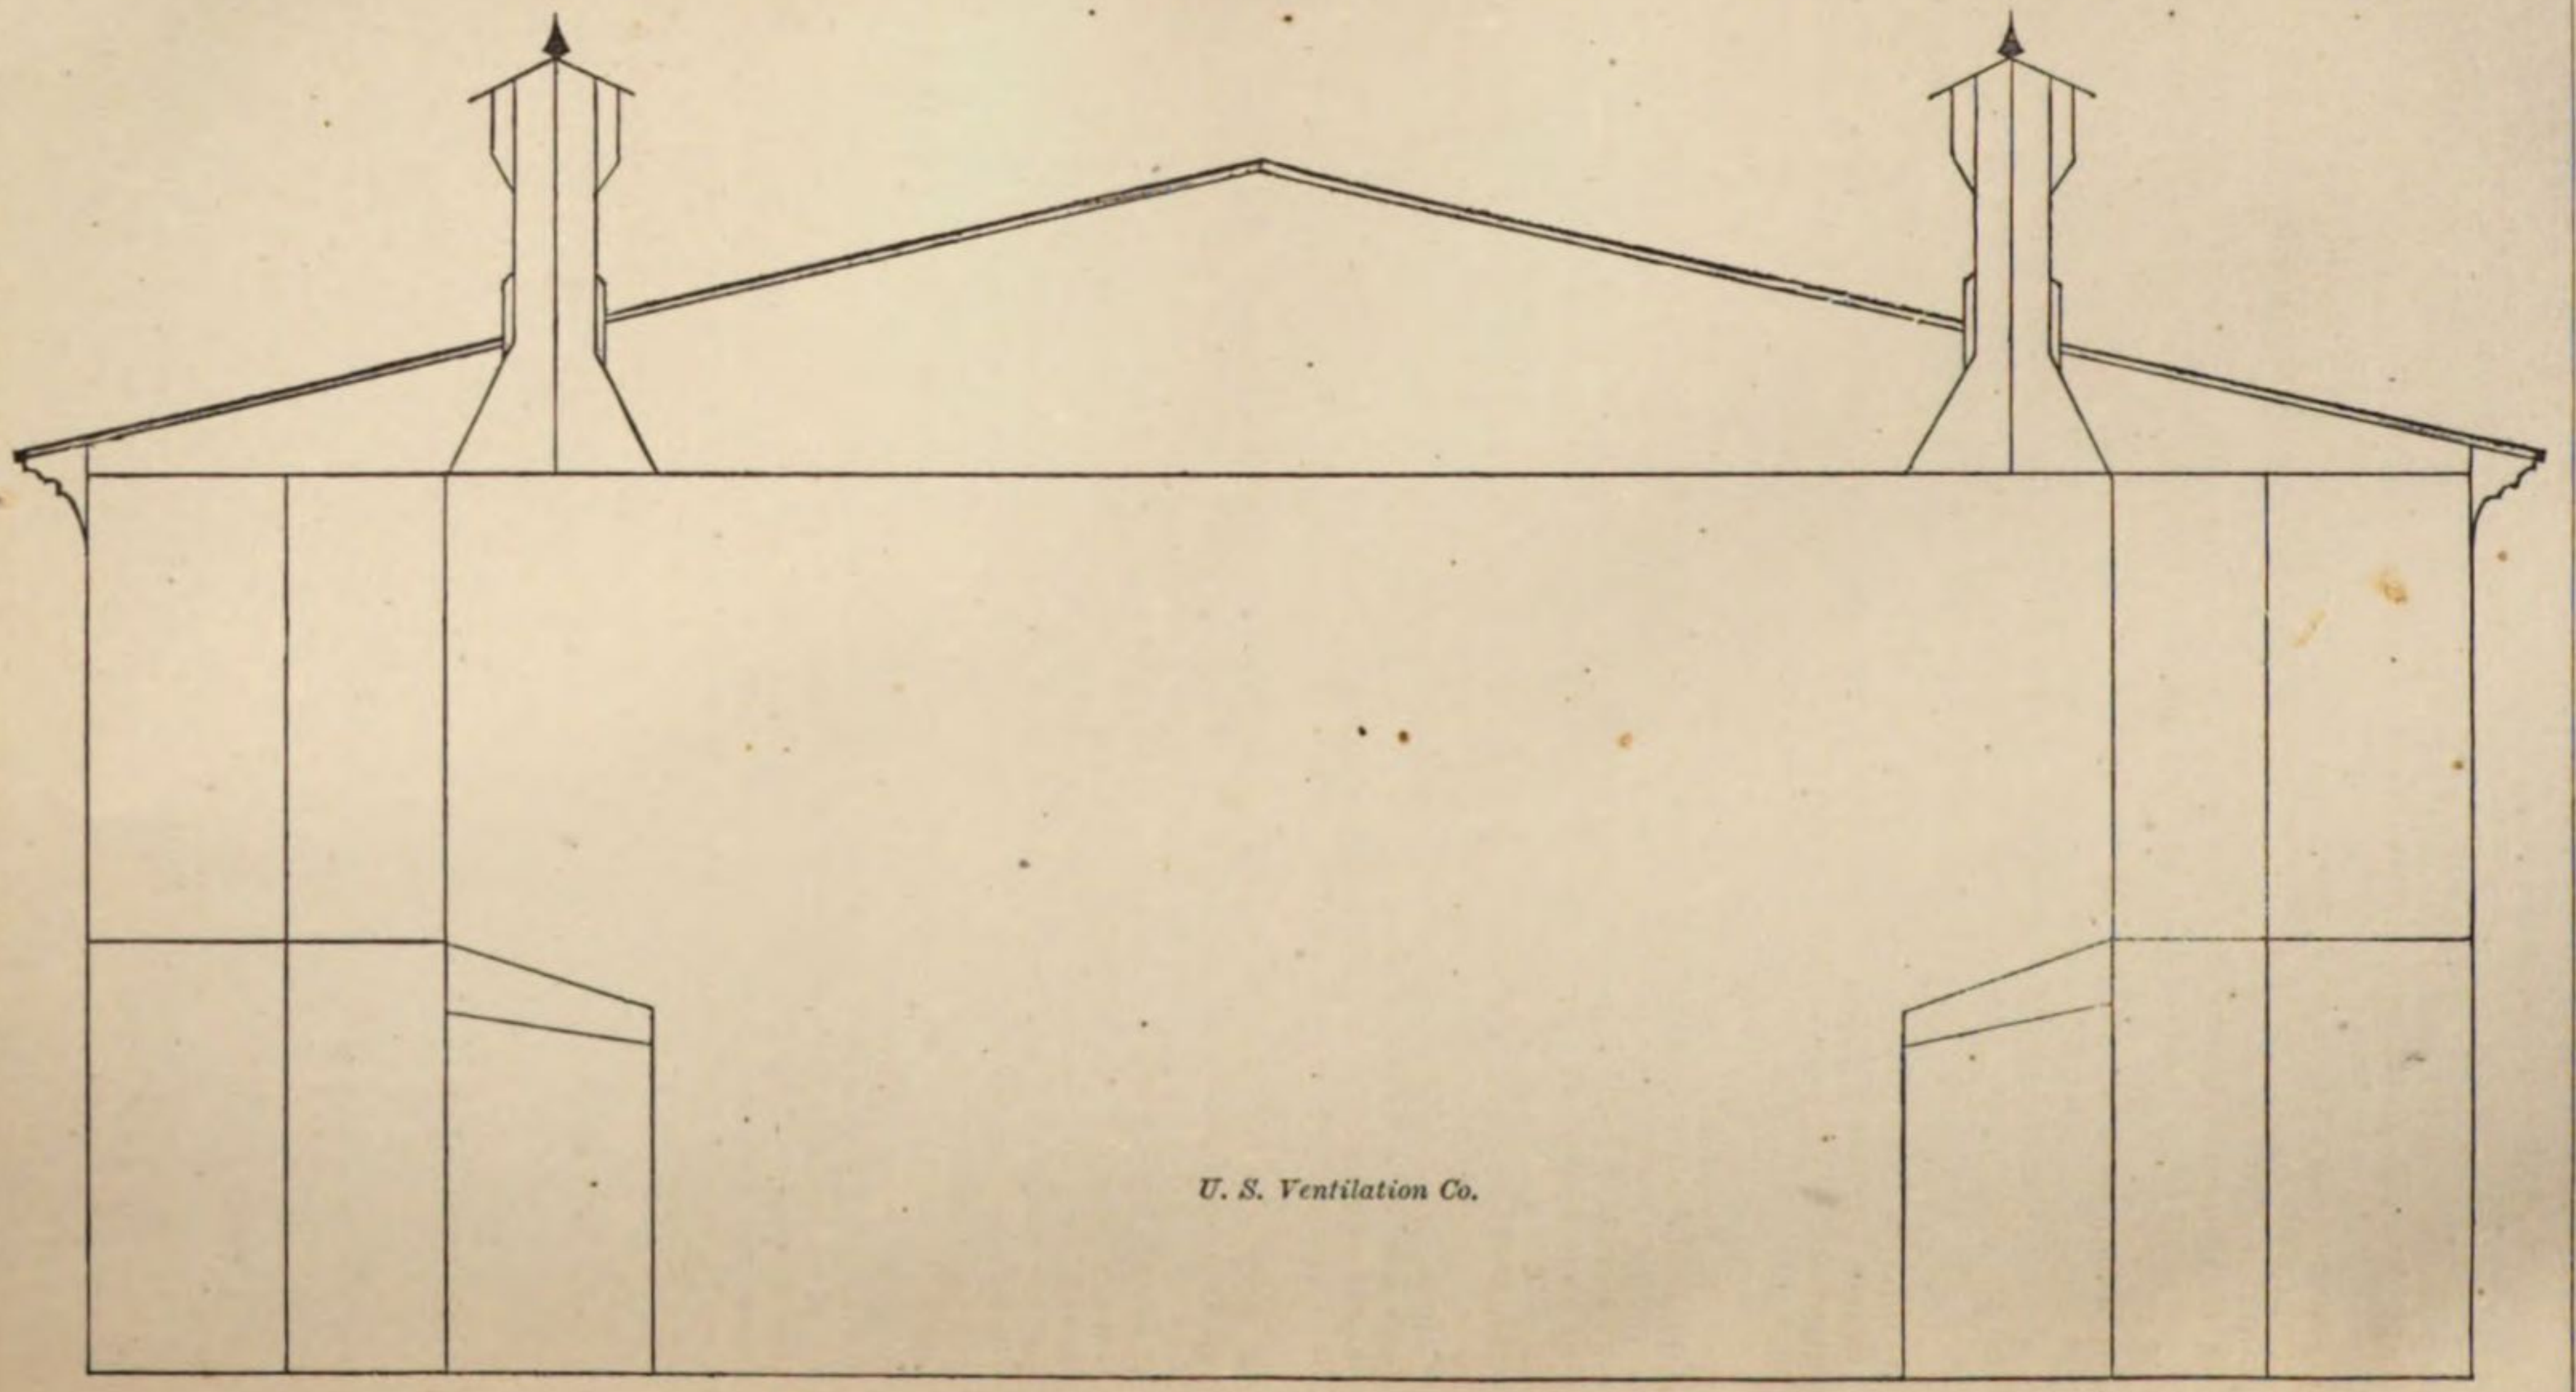
Very respectfully,

LUTHER ROBINSON,

For himself and the United States Ventilation Company of Boston.

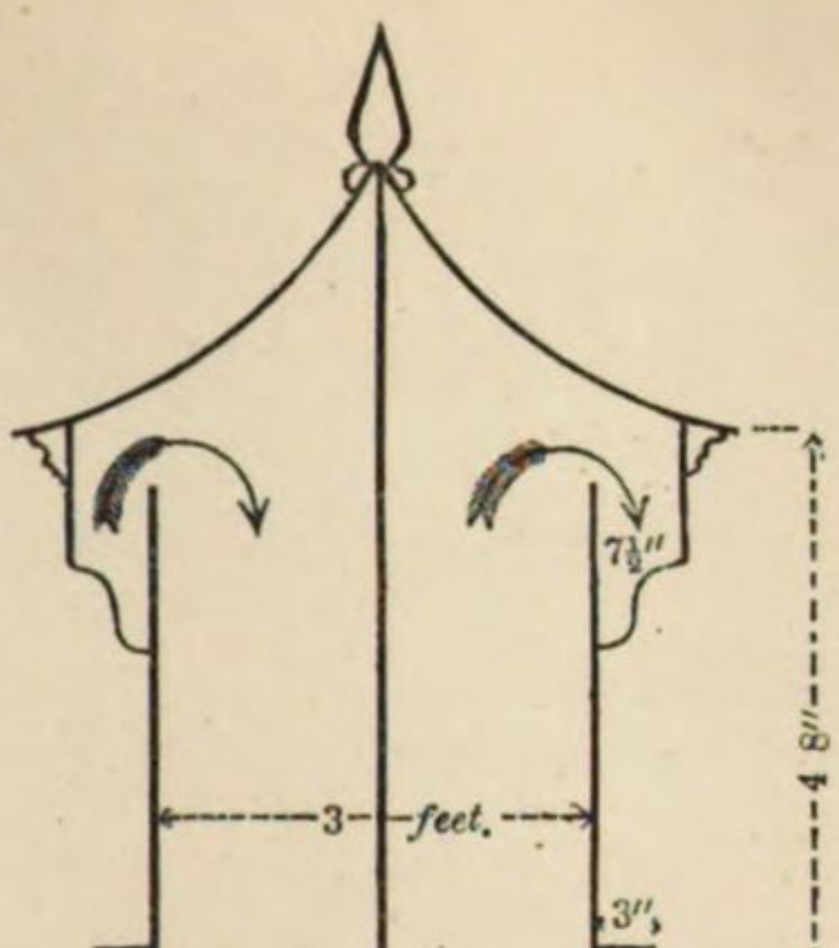
LUTHER ROBINSON'S PLAN FOR VENTILATING THE WINGS OF THE UNITED STATES CAPITOL.

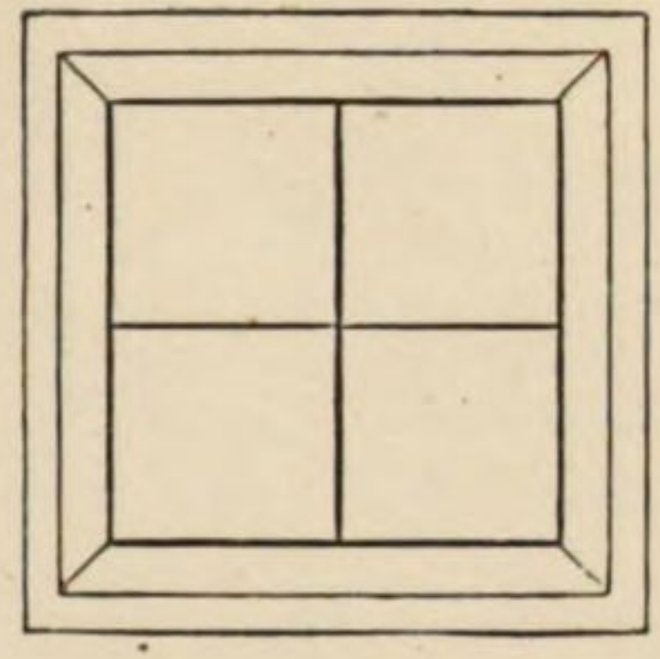
Sketch showing a cross-section of the Representatives' Hall, and one view of ventilators on the roof spreading across the galleries.



U. S. Ventilation Co.

U. S. Ventilation Co.,
L. Robinson, Agent,
Boston.





BOSTON, *July* 6, 1870.

SIR: I propose to apply to the south wing of the Capitol the system of ventilation described in my printed pamphlet, recently sent to you, substantially as follows:

1. At proper points near the glass over each stairway apply a ventilator 6 feet square, (or two of 4 feet square,) the boxes in the attic being so arranged as to use all of the open space over the stairways as mouths of the ventilating boxes. The boxes above said space to be so constructed as not to obstruct the light, the divisional planes being all vertical, and the glass of the roof forming the upper surface.

2. For direct ventilation of the Representatives' hall, at proper points on the roof apply eight ventilators, each 4 feet square, the boxes within the attic being so spread and arranged as to cover the entire galleries, using as mouths all of the open surface of the ceiling.

The openings between the brackets, next to the walls, I should wish to enlarge as much as practicable without disturbing the molding.

The boxes within the attics to be of galvanized iron, properly seamed, or riveted and soldered, all being strengthened and kept in place by such iron rods or frame-work as may be needful. All work to be well done.

Valves on iron axles to be of plate-iron of proper thickness, and cords for working them carried to some convenient point, as the stairway leading to the attic.

All the ventilators on the roof having for strength and stability a frame-work or foundation of wood, to be entirely and nicely covered externally with copper and lined on the interior with galvanized iron, so as to be entirely fire-proof.

Two of these ventilators would be abundant for any audience that I have seen in the hall, and the whole proposed is sufficient, under ordinary circumstances, for at least six thousand persons.

I am ready to contract to have the whole completed on or before November 20, in accordance with the spirit of the printed "plan" and of what is above written, in style and manner satisfactory to the committee after examination early in December, for the sum of $40,000, one-half to be paid on examination and approval of the mechanical work by the committee as above, and the other half on their approval of the results secured during the month of December.

Very respectfully,

LUTHER ROBINSON,
Agent United States Ventilation Company of Boston.

Hon. THOMAS A. JENCKES,
Chairman Committee on Ventilation.

P. S.—Within a few days I have seen an illustration of the benefits of this system as used in very hot weather—the air of a large occupied room being kept fresh and comfortable at 80°, while in similar rooms the temperature was 98°. Sufficient ventilation was received, excessive ventilation avoided, and every window was closed.

I am sure that the ventilation of this hall in hot weather can be so managed that the temperature shall be from 12° to 20° lower than if doors and windows are left open, as during the last month.

Respectfully,

L. R.

BOSTON, *January* 18, 1871.

DEAR SIR: I inclose a sketch showing a cross-section of the Representatives' hall, and one view of ventilators on the roof spreading across the galleries. The sketch formerly sent shows a ventilator, with box in the attic, spreading lengthwise. A series of them would cover the entire galleries. The proportions may not be accurate, but I am sure there must be abundant space to work in the attic.

The fans would never be needed for *ventilation* if our plans are used, although possibly in very warm weather currents of air from them, cooled by ice, or water, might give increased comfort.

We have found no difficulty whatever in the use of our plans in rooms warmed by hot air, where heat from furnaces or steam-pipes is the moving power.

Whether air is driven in by heat alone, or by fans, or by both, the principle is the same, and if we make our ventilators and the openings in the ceiling large enough, I cannot doubt that the results would be entirely satisfactory. As a matter of choice I should prefer that the fans should not be used at any time.

With the vast amount of steam-pipe used I think there can be no difficulty in supplying an abundance of air for warming, even without the aid of fans. If used at all, I should prefer to have them used only before the sessions, or at a *low speed* during the sessions.

The numerous openings in the ceiling are abundant for any ordinary audience; but the ventilating area can be increased by about 50 square feet if we remove the finely

perforated iron now between the brackets, on all sides of the hall; or still more by removing that and the surrounding moldings, gaining thus, perhaps, 160 or 180 square feet. In either case, these spaces should be covered by very open ornamental work. The space cannot fail to be abundant, even if the (interfering) fans *are* used, at full speed.

The true way is, to abandon the idea of using fans with any view to *aid in ventilation*, for which purpose they are surely unnecessary. If ever used, it should be to supply cooled air in very hot weather, or to aid a little, if needful, in supplying air for warming the halls in advance of occupancy.

Excuse unavoidable delay in making these promised suggestions.

Very respectfully, yours,

LUTHER ROBINSON,
Agent United States Ventilation Company.

Hon. THOMAS A. JENCKES.

VENTILATION OF THE HALL OF THE HOUSE OF REPRESENTATIVES.

JUNE 20, 1868.

Mr. Covode, from the Committee on Public Buildings and Grounds, made the following report:

The Committee on Public Buildings and Grounds, to whom was referred the resolution—"Whereas the confined and poisonous air of the hall and corridors of the Representative wing of the Capitol has caused much sickness and even several deaths among the members of this House, and under present arrangements must continue to remain in a poisonous condition: Resolved, That the Committee on Public Buildings and Grounds be directed to examine at once and report to this House by what means a sufficient supply of pure air may be obtained for said hall, and that said committee be empowered to use the present means of ventilation to the best advantage for the present; and that they report by bill or otherwise"—make the following report:

That they have given much attention to the subject. That after examining the several reports that have heretofore been made regarding the ventilation of the hall, they find the views of the most eminent men widely differing. First, as to any necessity for further ventilation; and second, should there be any need of improvement in this respect, how it could best be secured. It seemed to your committee that much of this wide difference of opinion was due to the entire want of positive facts, such as: First. How much fresh air does really enter the hall? Second. How much of the air flowing into the hall comes from the corridors, galleries, smoking-rooms, &c.? Third. Is there a fair and even distribution of the fresh air (if there is any) over the entire floor of the House, or does it all flow through one portion and leave the other portion stagnant and foul?

With the hope of eliciting some more definite information in regard to these points, your committee determined to call in the assistance of some professional men who had devoted much time to this subject. They first called upon General Herman Haupt, an engineer distinguished not less for his scientific attainments than for sound judgment and long experience.

General Haupt graduated at West Point in 1835; he has been favorably known to the chairman of the committee for more than twenty years, as chief engineer and general superintendent of the Pennsylvania Railroad. For several years he was professor of mathematics, civil engineering, and architecture in Pennsylvania College.

The systems of ventilation as applicable to mines and tunnels also received at his hands a thorough experimental investigation, and results of the highest practical importance were elicited.

For these reasons the committee have considered the opinions of General Haupt as eminently worthy of confidence, even in opposition to the distinguished names that have been appended to previous reports.

The report of General Haupt is appended to this report.

The committee also called on Mr. Lewis W. Leeds, a gentleman who has devoted his attention exclusively to the subject of ventilation for many years past; was consulting engineer of ventilation for the Quartermaster General and Surgeon General during the war, in which service he gave the plans and directions for the ventilation of most of the Government hospitals, the practical results of which have been spoken of in the highest terms by all the medical men and other officers acquainted with the operations thereof.

The system of ventilation adopted for these hospitals also received the highest commendation from the committee on sanitary arrangements at the late Paris Exposition.

Mr. Leeds is at present consulting engineer of the Treasury Department, and has arranged the ventilation for the various new buildings under the charge of that Department. His report, with a number of diagrams, giving a record of a large number of experiments, and giving also a summary of the results as indicated by those experiments, is also appended to this report.

Mr. Leeds's report gives the record of twenty-six experiments, tried on the 5th instant, for the purpose of determining the direction of the perpendicular currents in the loft over the hall of Representatives. These show that the air from the loft is falling down into the hall all around the northeast and south sides of the room; it rises in the west.

Twelve different experiments show the temperature on the afternoon of the 5th to range from 44° to 48° around the exterior, and only 56° on the glass ceiling immediately over the center of the room. At 9 o'clock on the morning of the 7th, the thermometer was 38° in the loft.

Fifteen experiments tried on the morning of the 6th show these cold currents from the loft to sweep down on the outside of the galleries, carrying with them all the air contaminated by the crowds in these galleries, and pouring it over into the floor of the House; this occurs on the northeast and south sides of the House, rising on the west.

There was a strong current found to be setting *in* to the House from every external door both on the floor and in the galleries. Thus it will be seen that instead of the hall of Representatives being overflowed with fresh external air, and, as we have been so often told, with 40,000 or 60,000 cubic feet per minute, the truth is, the floor of the House, where the members sit, receives the washings from the foul corridors, galleries, loft, &c., and is really the foulest place in the whole building.

There is a very small amount of air, indeed, coming in through the registers on the floor of the House; but this, by some, may be considered an advantage rather than otherwise, as many of them are so choked up with tobacco spittle and sweepings of the floor as to render the air rising from them very disagreeable.

Your committee have tried a number of these experiments with Mr. Leeds and find them substantially correct.

It is very evident from these experiments that the original intention of the designers must have been so mutilated by subsequent alteration as to entirely defeat the object desired to be gained, and that there is now a necessity for some decided change.

General Haupt enters into an elaborate argument to show that the carbonic acid and other impurities from the lungs and skin fall to the floor, and consequently provision should be made for the removal of the foul air from that point. He proposes leaving the entrance for the heated air at the floors as at present arranged.

Mr. Leeds quite agrees with General Haupt that the carbonic acid from the lungs falls to the floor in a still room with a temperature of 70°, and that an excess would be found there, especially where all the air enters warmer than the required temperature of the room. He thinks there should be openings for the escape of the foul air from numerous points over the floor.

Mr. Leeds says, however, that the whole system of heating *exclusively* by circulating warmed air is wrong, and that no building can ever be made comfortable and satisfactory in that way; that where all the air is heated hotter than is required for breathing, it produces languor and debility similar to what is felt of a hot, close summer day. He says that it is absolutely necessary that there should be a considerable amount of direct radiation, and proposes that there should be several good old-fashioned wood fires, and perhaps some steam radiators placed in some portions of the room; or, what would answer equally well, to have the sides of the walls heated to about the temperature of our bodies, or a little warmer, so as to be radiating heat to us instead of robbing us of it.

Mr Clark, the present Architect, quite agrees in this opinion, but thinks it would be better to have the fires in the cloak-rooms. He also says he thinks the present floor should be taken up, and either the whole space under the floor be used as a general hot-air chamber, or that there should be a different adjustment of the flues, as since the completion of the building one-half of the registers have been removed by parties not connected with or familiar with the original construction of the building; and he thinks the original construction of the flues has been materially interfered with, as it is now difficult to heat the side farthest from the entrance of the warmer air to the same height by several degrees as that nearest the entrance thereof.

It must be very evident to every one, from the resnlts given of the experiments tried, that when the gas is lighted much of the foul air and products of combustion must descend into the hall. This ought to be prevented.

Your committee believe, as expressed by Mr. Leeds, that it is essential that the direct rays of the sun should shine into every occupied room to preserve it in a pure and wholesome condition. And they believe it quite possible that some plan might be devised by which this desirable object could be accomplished at small expense and without materially changing the present construction of the building.

Your committee would recommend that a competent person should be employed to

make such further examinations and experiments as may be necessary to determine the conditions of the ventilation under the various changes of wind and temperature, and that he make a report, with such plans as may be necessary for illustrating these suggestions as to the best means of improving the ventilation and the heating and lighting.

To the Hon. John Covode, Chairman of Committee on Ventilation :

An examination of the ventilation and heating of the hall of Representatives at the Capitol has fully convinced me that very serious defects do actually exist in the present systems.

But I find, after a careful examination of the elaborate reports of Professor Henry, Dr. Wetherill, Thomas U. Walter, and others, that I am obliged to differ with these gentlemen as to the best means of ventilating this building.

In thus differing in opinion with such distinguished gentlemen, I shall feel it my duty to express fully the grounds upon which I base that opinion.

FUNDAMENTAL PRINCIPLES OF VENTILATION.

The plans proposed for the ventilation of the hall are based on two simple propositions :

1. Heated air is relatively lighter than colder air, and will continue to ascend and the cold air to descend so long as they are free to move.

2. More or less than a given quantity of air, practically considered, cannot occupy an apartment, and air cannot be introduced unless an equal quantity be withdrawn, or withdrawn unless an equal quantity be introduced.

These two simple and self-evident propositions will explain nearly all the phenomena observable in ventilation.

PHENOMENA OF VENTILATION.

If heated air is introduced into an apartment containing air at a lower temperature, through registers at the floors, it rises rapidly to the ceiling; and if there are openings at the ceiling it escapes without, except in a very slight degree, mixing with the air in the apartment. The air that passes off in this manner is absolutely lost and the heat imparted to it wasted. It does not remove the vitiated air contained in the lower part of the apartment; it does not form with it a homogeneous mixture, and does not communicate to it more than a small portion of its heat. But if, instead of the escape openings at the ceiling, they are placed at the floor, the phenomena observed will be widely different. The heated air will, as before, rise to the ceiling, but instead of escaping will press the colder air downward toward the exit ducts and fill the apartment with pure, warm air; the air vitiated by breathing will at once sink below the level of the mouth and in a few seconds will be carried off, no accumulation of foul air being possible. In these few words the whole theory of ventilation is in a general way presented; it only remains to make an application to the case under consideration.

QUANTITY OF AIR REQUIRED.

In the able report of Dr. Wetherill (Ex. Doc. No. 100, 39th Congress) various opinions are given as to the amount of fresh air necessary to render the products of transpiration and respiration innocuous. These estimates, made by distinguished observers, vary from 2 to 50 cubic feet per man per minute.

These estimates are generally made upon the hypothesis that the fresh air introduced into an apartment mixes uniformly and homogeneously with the vitiated air and dilutes it to an extent sufficient to render it innocuous; but if, instead of mixing with the air of the apartment, *the warm, pure air* should RISE to the ceiling and escape, all conclusions based on the hypothesis of homogeneous mixture would be fallacious; and this fallacy, it appears to your committee, pervades the whole of the very able scientific reports that have been heretofore submitted.

The House of Representatives has a capacity of 465,372 cubic feet and is supplied with 60,000 cubic feet of fresh air per minute, which Dr. Wetherill assumes will change the whole air every seven minutes and furnish to each of a thousand persons 60 cubic feet per minute.

If the whole air were changed every seven minutes, or even once in an hour, the ventilation would be ample, whereas it is notoriously defective. It is obvious, therefore, that nearly all of the 60,000 cubic feet per minute must on the present system escape without performing its intended office in purifying the air.

If air that has once been respired could be immediately removed without being a second time taken into the lungs, it is obvious that so far as respiration is concerned

no more air need be introduced into an apartment in a given time than can be breathed. This amount is easily calculated.

At a temperature of from 65° to 70° Fahrenheit the following average results are given by Dr. Wetherill, for the respiration of an adult:

Number of respirations per minute	20
Cubic inches of air inhaled at each respiration	20
Cubic inches per minute	400

The carbonic acid exhaled is stated to be 15 cubic inches per minute, and the surrounding air vitiated is 2½ cubic feet per minute.

Four hundred cubic inches is less than one-fourth of a cubic foot, and this is all that can be taken into the lungs per minute. It would seem reasonable to suppose that if this small quantity could be removed at once, so that no portion of it could be breathed a second time, no greater amount of air for respiration could be required. Certainly it would seem that the removal of the 2½ cubic feet vitiated by respiration would be an ample allowance. What judgment, then, should be pronounced upon the present system, which with 60 cubic feet per man per minute fails to remove the vitiated air?

The quantity of air introduced is twenty times as great as the quantity that could be vitiated by respiration, provided there was a homogeneous mixture. The facts which are daily observed prove that such homogeneous mixture does not exist under the present system.

If nineteen-twentieths of the heated air which enters the apartment escapes without being utilized, it follows that nearly all the fuel consumed in heating it has been wasted.

POSITION OCCUPIED BY VITIATED AIR.

In the process of respiration 15 cubic inches of carbonic acid per man per minute are ejected from the lungs. This gas in course of time would diffuse itself throughout the apartment, but it is well known that its density is so great that it can be poured from one vessel into another, or if poured into an inclined trough it will flow downward, extinguishing successively a row of lights. The specific gravity of this gas is 1.52, or 52 per cent. heavier than air. Its tendency would therefore be when exhaled to sink below the level of the mouth, and occupy the lower portions of an apartment near the floor; but it has been supposed that the elevated temperature at which it is projected from the lungs causes this gas to rise and escape at the roof. The fallacy of such an opinion can be readily proved.

Even if the temperature at which carbonic acid escapes from the lungs should be so elevated as to render it momentarily specifically lighter than the surrounding air, it would soon part with the excess of heat and then seek the level due to its superior density; but, in fact, under the condition of things which actually exists, there is only about 20° difference in temperature between the air when first expelled from the lungs and that of the apartment, as air increases in volume $\frac{1}{460}$ of its bulk for each degree of Fahrenheit. The effect of increasing the temperature 20° would be to reduce the specific gravity less than 10 per cent., and the carbonic acid upon leaving the lungs would still be 40 per cent. heavier than the air of the apartment. It would seem impossible for this dense gas to rise to the ceiling and escape at that level without a violation of the laws of pneumatics, and yet the projectors of the present system of ventilation made no provision whatever for its escape at the level of the floor, at which level alone it is possible effectually to remove it. Mr. Clark, the present Architect, seems to have appreciated the necessity of doing something to remove the carbonic acid at the level of the floor, and he provided an 8-inch tin pipe connecting with one of the registers, but an exit duct fifty times the area of the present openings in the register would not be sufficient, and the inlet and exit ducts should allow of the passage of nearly equal volumes.

DEFECTS OF PRESENT SYSTEM.

The defects of the present system of ventilation are apparent from the preceding considerations. Although 60,000 cubic feet of heated air per minute are forced into the hall through registers in the floor, nearly the whole volume rises rapidly to the ceiling and escapes through openings provided for it without carrying with it the carbonic acid and other impurities, and this evil is greatly aggravated by the fact that not only the air vitiated by the members, but also that from the galleries, often crowded to excess, seeks the lowest level in the hall, to the great injury and discomfort of all whose seats are near the floor.

REMEDY FOR EVILS.

The remedy is simple; it consists in an application of the principles contained in the two propositions which were enunciated at the commencement of this report: Close

the openings at the ceiling, and make others of area equal to the inlet registers at the floor and around the galleries. The exit ducts should communicate with flues in which a current may be maintained by means now in use; but it would, in my opinion, be greatly intensified by throwing the exhaust steam from the engine or boilers in intermittent jets into this flue, instead of allowing it, as at present, to escape without being utilized.

PHENOMENA OF VENTILATION UNDER THE PROPOSED SYSTEM.

The heated air entering the hall through the registers would rise at once to the ceiling; unable to escape, it would accumulate and press downward the air previously in the apartment, until in seven minutes the whole of the air would be changed, the dense and foul air being carried off at the level toward which it naturally flows, and at which alone it can be removed. This operation is greatly facilitated by the large exit ducts connected with the flues. It will be perceived that, under this system, the tendency of the pure air is first upward, in currents, and then slowly downward. The exhaled gases sink at once below the level of the mouth, reach the floor, and are carried off. From a height of four feet above the floor they would descend and be removed in less than a minute, and it is probable that less than one-fourth of the fuel now consumed would maintain a proper temperature, as a much larger portion would be utilized.

The vitiated air from the galleries should be drawn off by flues inside the balustrade, and at the lowest level. No fears need be entertained that any considerable portion of foul air would be projected over the balustrade and into the body of the hall. All that did enter the hall in this way would be drawn off through exit openings on a level with the floor below the galleries, and there should also be a very large exit opening in the center at the lowest level of the floor in front of the Speaker's desk. As the gallery is supported by an 18-inch brick wall, there is no difficulty in making these alterations, and the best manner of doing it can be readily determined by the intelligent Architect of the Capitol. The committee have not entered upon the details; the principles involved seemed to them to be much more worthy of their careful consideration.

MOISTURE.

I would suggest, as the most simple and practical mode of moistening the air in winter, that a jet of steam from the exhaust-pipe of the engine be thrown among the heating coils, the amount of which could be regulated at pleasure, and would help to economize fuel. I also concur with Mr. Clark, the Architect of the Capitol, in the opinion that, for summer ventilation, the air should be cooled and moistened by being drawn through the spray of fountains and carried over the surface of water basins at the bottom of the inlet ducts.

I also unite with Mr. Clark in recommending, in strong terms, the importance of having all the arrangements for heating and ventilation under the charge of the engineer or some other responsible and intelligent person, who, by means of suitable thermometers and hygrometers, should ascertain the temperature and the hygrometric condition of the air, and maintain both at such uniform standard as may be prescribed.

EFFECTS OF COMBUSTION OF GAS.

It is asserted in Dr. Wetherill's report that each flame consumes as much oxygen and gives out as much carbonic acid as five human beings. This is an additional and strong argument in favor of the proposed change in the mode of ventilation. As the gas jets above the ceiling are separated from the hall by intervening glass, the carbonic acid can be effectually prevented from entering the hall by closing the openings at the ceiling.

OBJECTIONS CONSIDERED.

It has been asserted that downward ventilation has been tried, and has not proved successful. No reliance can be placed upon a statement of this kind unless the circumstances and conditions under which the trial was made could be ascertained. Success or failure often depends on the manner of doing an act. So far as the report of Dr. Wetherill gives facts, the evidence is in favor of downward ventilation. In the observations of General Morin, page 65, it is stated that a ventilation of 14⅓ cubic feet per man per minute, *principally downward*, left no perceptible odor in a lecture-room, while the *upward ventilation* of the halls of Congress, with 60 cubic feet per minute, is notoriously defective.

On page 69 is found a paragraph on "the direction the products of respiration take after leaving the body," in which it is attempted to prove that the direction is upward. The evidence in support of this position is that when the author of the report smoked a pipe at the Smithsonian Institute the smoke ascended. But the objection to this experiment is that tobacco smoke is not one of the ordinary products of respiration, certainly not in the halls of Congress. The experiment does not prove that the gray smoke which was seen to rise was carbonic acid; the experimenter does not state in

what direction were the ventilating currents in the apartment, or how produced; and there was nothing in the experiment to prove that, with a gentle downward ventilation, the smoke would not have moved downward, instead of upward. In fact, it proved nothing at all in reference to the direction of the products of respiration.

In contradistinction to such crude experiments is the fact that a system of downward ventilation has quite recently been introduced into the Pennsylvania Hospital, at Philadelphia, with perfect success. It was also very extensively introduced into the Government hospitals during our late war, and proved highly satisfactory. The open fireplace, too, is a very familiar illustration of the value and success of lower ventilation.

In conclusion, I would strongly urge the adoption of this system of ventilation, and recommend that the Architect be directed to prepare plans at once, suggesting the most convenient method of executing the work, to be submitted to Congress.

Truly yours,

HERMAN HAUPT.

To the Hon. John Covode, Chairman of Committee on Ventilation of the House of Representatives:

I have read with care and much interest the report of General Herman Haupt on the ventilation of the House of Representatives.

I quite agree with him in his conclusions both as to theory and the necessity for putting in practice a system of exhaust for ventilation from the floor of the House.

Very extensive practice and close observation for many years past have fully convinced me that the human breath, which is the great source of contamination, in an occupied room tends first toward the floor in a still room of 70°, and that there is a probability in a closely occupied room that there will be quite an excess in the accumulation there.

This applies especially to rooms warmed exclusively by hot air.

The contrary opinion—that is, the assumption that the breath and impurities exhaled from the body rise to the ceiling and accumulate there, was advocated strongly in the ventilation of the English houses of Parliament. And as some two or three millions of dollars were spent, I believe, in endeavoring to heat and ventilate that building comfortably, and as the proceedings in regard thereto were spread over the world to an extent probably one hundred times greater than any previous publication or action in regard to the ventilation of any public building, that theory of ventilation became strongly impressed upon the public mind as being the correct one.

I consider that idea erroneous; hence all theories of ventilation based upon it are consequently wrong.

But we must notice this applies to rooms warmed exclusively by heated air. We must not fall into the error the little boy did who, receiving a good thick overcoat on a right cold day, found it exceedingly comfortable, and being so thoroughly convinced in his own mind of its great value, insisted on wearing it warm days too.

In the majority of our rooms the excess of the air entering (which we must of course assume to be the pure air) does not enter warmer than the contained air one-half of the time, and probably not more than one-quarter of the time.

It ought *never* so to enter. This whole theory of warming rooms exclusively by hot air is entirely wrong, and the discomfort experienced in the present halls of Congress is probably as much owing to the want of some direct radiation in the rooms as to any excess of carbonic acid present.

I have given much attention to this subject within the last year, and my observations fully confirm the opinion that no building in which all the air for breathing is heated hotter than the required temperature of the room (no matter how the air is warmed, whether by steam, hot water, or otherwise) can ever be made entirely satisfactory.

When the air breathed is nearly of the same temperature of the body it loses its invigorating influence; it produces languor and debility.

We all know the exhilarating effect of a cool bracing air of a clear, bright sunshiny day. The direct radiation from the sun is very powerful. A thermometer protected from the influence of the wind and laid in the sun of a clear, bright day in winter, with the air below the freezing point, will rise to near 200°. This is the condition most favorable to active exercise, bodily or mentally, and must be approached in our artificial arrangements before real comfort can be secured.

Any member can easily satisfy himself upon this point by a few days' observation of the effect produced upon his own person while in the halls of Congress, which are warmed exclusively by heated air; and comparing that with the effect produced in a room with an open fire, (if he should be so unfortunate as to be in a room heated by hot air at home, as well as at the Capitol, I pity him,) he will soon find that five hours' labor, especially mental, will be more exhausting in the former than seven hours in the latter room, all other conditions being equal.

He will also soon notice that in the room with the open fire his head will be clear and his thoughts flow freely, while in the room heated by hot air his head will be full and oppressed, his thoughts will become confused and clouded, and to perform a certain large amount of work becomes very fatiguing both to body and mind.

I consider it absolutely essential, therefore, that some modification should be made in the manner of heating the halls of Congress.

Care should be taken, however, not to rush to the other extreme and get too much direct radiation.

A room heated exclusively in that manner, with all the fresh air entering of the temperature of the external atmosphere, causes cold unpleasant draughts which can and ought to be avoided.

The decided preference given of late years to heating exclusively by direct radiation, over heating by circulating warmed air, shows that the former with all its objections is preferable to the latter.

The combination of the two, however, produces the most satisfactory results.

The best possible manner of applying these principles would require considerable thought and a careful examination of the building.

The open fire is one of the best sources of radiant heat; it more nearly imitates that from the sun than any other in common use.

Some persons might object to having open fires in the hall of Representatives, but I don't know why it should be so objectionable. Direct radiation from steam-pipes would be much less trouble, and would be preferred, no doubt, on many accounts, for producing the greater part of the radiant heat.

Another very serious objection to heating exclusively by warmed air is that precisely the same temperature is scarcely agreeable to two persons in a hundred, and even the same person wants a constantly varying temperature according to the ever-changing conditions of his system.

It is of course exceedingly difficult, and perhaps entirely impossible, to fully meet all these varying wants, but it would not be difficult to come much nearer to it than at present.

It might be possible for steam-pipes to be arranged under the floor and covered by soapstone foot-stools, so that each member could regulate the heat at his own desk at pleasure; but this might not be of sufficient importance to make it advisable to have it put in practice.

Now when the manner of heating is changed it may affect the arrangements for ventilation. One thing, however—the importance in regard to the location of the inlets and outlets of the circulating air diminishes as the proportion of the heat derived from direct radiation increases.

I believe it would be at all times and under all circumstances very desirable to have a large amount of the air drawn from the floor, as nearly as possible from under or near each member's seat, and also from under the seats of all the benches in the galleries. But to know how and when and how much to draw from the ceiling would be a much more difficult question to decide.

The openings at or near the ceiling require to be closed and opened according to the varrying conditions of the room, and it can only be ascertained how they can be best regulated by experience.

That there should be such openings we all know from our every-day experience of the necessity for opening doors or lowering *external* windows, (where we are so favored as to have that luxury,) to relieve the upper part of the room when it gets too warm.

I think the present arrangements for introducing the air very objectionable. If there were a considerable amount of heat furnished by direct radiation, so that the inflowing air could be several degrees below the required temperature of the room, it would have a delightful refreshing effect to have it fall in gentle currents from the ceiling, and this would cause the least possible disturbance of the atmosphere, which is very essential in producing the best acoustic effect.

We all know if our feet and backs are kept perfectly warm and comfortable we are all right. We can then bear a large amount of cool refreshing air in our faces and on our heads.

To successfully heat and ventilate a large complicated building it is of primary importance that you should have a thoroughly comprehensive plan that shall include, not only the whole building, but all its surroundings.

Heat applied within any building causes movements of the air with more or less force, according to the difference of temperature of the external and internal atmosphere. The external wind is a source of considerable power. These two forces, if properly applied, are sufficient to ventilate an ordinary building nearly every day in the year; there may be a few days, however, when the external air is almost stagnant and it is too warm to have heat in the house; it then becomes necessary to resort to some artificial power for the movement of the air. This can be done by the application of mechanical means, as at the halls of Congress at present, or by the more simple and direct application of heat to exhaust-flues.

But the important matter is in the application of this power to make it conform to and coöperate with the natural forces and merely assist their action, or otherwise make it of sufficient power to entirely overcome all these natural forces.

If much care is not exercised in the adjustment of these forces, one will just counterbalance the other, and stagnation is the result. This, I think, is frequently the case in the Capitol building.

I have never made any examination to ascertain the fact, but it seems to me probable that the air entering the hall becomes foul in passing through it and rises into the space under the roof and there becomes cool, and much of it becoming mixed with the air from the burning gas, tumbles back into the room much fouler, if possible, than it went out. This reminds one of pumping little jets of pure water in all over the bottom of a muddy reservoir, by which the whole mass is kept in a constant roily, muddy condition.

There seems to be an entire unanimity among all parties as to the necessity for additional moisture. This I think of much importance.

I however doubt the propriety of allowing the steam to be discharged directly into the fresh-air channels. There is often an unpleasant smell from escaping steam, and more frequently from the air driven from steam-pipes as the steam enters. This could be tried, however, very easily, and it might not be found objectionable.

Although not directly connected with the subject of ventilation, yet I would take the liberty of suggesting that I think there is a deficiency of sunlight in the hall of Representatives. The sun's rays are the great source of purification, the great natural disinfectant, as well as the great moving power in the growth and development of all animal and vegetable life. We find cretinism and imbecility to predominate greatly on the shady sides of the mountains. In the Russian barracks it was found that sickness and mortality were much greater on the shady side than on the sunny side, even of the same large room.

The great value of an abundant sunlight was most fully demonstrated throughout our own very extended system of barracks and hospitals occupied during our late war.

I would by no means intimate that I believe the ingenuity of man can never produce these chemical life-giving influences the same as he has already produced light almost equal, for his own limited purposes, to the great source itself. And it was certainly very creditable in the original projector of the buildings' to endeavor to be as independent of all external influences as possible, and to rely as much as he well could on man's own ingenuity and resources.

But as the chemist or philosopher has not yet learned to make so much as a clover-leaf or a caterpillar, would it not be well for the present to go back to the old-fashioned plan and use a little more sunlight for the purification and disinfection of the rooms under consideration, while the chemists and philosophers are perfecting their plans, especially as sunlight can still be procured quite cheap, and is one of the few comforts of life that have not been doubled or trebled in price since the completion of those rooms. I think if a little ingenuity were exercised upon it there would be but little alteration required and not much expense incurred in introducing sufficient to produce a very perceptible influence.

As this building is entirely different from any other building in the world, and the knowledge in regard to the subject of ventilation is still so limited, it would seem to me to be wise on the part of Congress to employ the best talent and practical experience the country affords, to make a thorough examination and such experiments as they might require for the full illustration of the subject, and have them report in full the present condition of the ventilation, heating, and lighting, and such suggestions as they might have to make for the improvement thereof.

I believe such information could thus be procured as would enable Congress to act with much more confidence, and would produce results much more satisfactory than to act upon any information it now possesses.

I am, with much respect, thy friend,

LEWIS W. LEEDS,
Consulting Engineer of Ventilation and Heating,
for United States Treasury Department, &c.

WASHINGTON, 1*st Month* 13, 1868.

Additional report.

To the Hon. JOHN COVODE,
Chairman of Committee on Ventilation of House of Representatives:

Since making the foregoing report I have made a large number of experiments to determine the temperature and direction of the currents in various parts of the building.

I commenced at half-past 12 on the 5th, and tried sixty-three experiments in the loft over the House, in various parts, to determine the directions of the currents there, a memorandum of which I inclose, marked 1, 2, and 3.

I also took the temperature in twelve different places in the loft, a memorandum of which is also inclosed, marked 4.

On the morning of the 6th I commenced an examination of the position of the registers on the floor of the House, at ten minutes of 10 a. m., and also took the direction of the currents at top and bottom of all the doors opening into the hall; also, the direction of the currents in twenty-seven other places in various parts of the hall; also, the temperatures at seven different points around the side of the hall. Memorandums of these experiments are also inclosed, marked 5, 6.

On the morning of the 7th I went to the House at a quarter past 7 a. m., for the purpose of ascertaining the temperatures in the loft over the hall; but as the workmen had the keys, and did not get them until half-past 8, I could not test the temperatures until 9, the sun being then two hours high; clear, bright day. The results are inclosed, as well as the temperatures in the galleries and around the sides of the hall, as observed at the same time.

I had no expectation of finding the supposed conditions noticed in the preceding report (which were based upon mere theory) so nearly correct, and capable of being so clearly and fully proven by these experiments.

It will be noticed by the experiments on the 5th that the temperature in the loft was 44° and 48°, at 3 p. m.; on the 7th, at 9 a. m., it was 38° on the east end, and 45° on the west end.

The experiments of the 5th show that there was a strong descending current all around the exterior of the hall, excepting the west end, from the loft into the hall, and the experiments of the 6th show this current carried over the galleries and tumbled down onto the floor of the House. The other experiments show that there is a strong current rushing in from the corridors, through all the doors, without exception, both on the floor and on the galleries.

Now, when we consider the corridors are the principal ventilators for the engine-room, restaurant, water-closets, &c., &c., and then add to this most of the foul air from the galleries, it will be seen that the floor of the House is the final receptacle of all the washing of the building, and is the foulest pit of the whole.

It will also be observed that the current is from the east side towards the west side, and there rises to the attic, and much of it from there flows across to the foul-air shaft; consequently about the center of the west side is the place where the air leaves the occupied portions of the building, and probably that is, therefore, about the foulest place in the whole building.

An examination of the condition of any of the registers will convince any member as to how much relief he can expect from them. The accompanying diagram, showing how many of the registers were open and how many closed, is merely an approximation, as so many of them were so choked up with tobacco spit, sweepings of the floor, and other trash, and there was such a foul smell coming from them, that it was difficult to determine whether to consider them closed or open.

I should think it would be well to try the experiment of reversing the fan and drawing the air *from* the floor instead of *forcing it in*; but with the present arrangements for heating and supplying fresh (?) air, it would probably merely aggravate the difficulties.

The little positive knowledge thus gained by the few experiments already tried more fully convinces me of the necessity for and value of a series of experiments, extending over a month or six weeks, and taken under all conditions of wind and weather, and when the house is crowded and when but few are there.

An entirely different condition of things will probably be found to exist when the whole lighting apparatus is in full blast.

Very respectfully,

LEWIS W. LEEDS.

WASHINGTON, D. C., *2d month* 8, 1868.

SMITHSONIAN INSTITUTION,
Washington, January 17, 1871.

DEAR SIR: * * * * * *

I have examined the glass as to translucency, and find that the figured pattern absorbs about one-half of the light, while the plain, varnished specimen absorbs only about one-fourth.

I have the honor to be, very respectfully and truly, your obedient servant,

JOSEPH HENRY,
Secretary Smithsonian Institution.

Hon. THOMAS A. JENCKES,
United States House of Representatives.

110 BROADWAY, NEW YORK, *5th month* 3, 1870.

To the Joint Committee on Ventilation :

GENTLEMEN : In experimenting with a view to the improvement of the ventilation of the halls of Congress, I think it would be very desirable to ascertain the general movement of current in the whole building as a mass, and see what are the great natural causes of motion or agitation.

I think the central dome will be found to exert a great influence, extending to both houses of Congress. Then to ascertain the more local causes of disturbance in various places, and to trace the currents to sources of contamination when such occur. Also, to note carefully the influence both of external temperature and the directions and force of external currents. Then to examine the artificial means of producing currents both by the fans and the heated shafts, and to measure carefully their relative value for moving the air in proportion to fuel consumed. These currents can be best measured and recorded by carefully-made anemometers.

It would be well, I think, to make a careful record of the hygrometric condition of the air, which could be done by one or two hygrodeits.

One of the greatest sources of annoyances, I think, is the variations of heat and cold from the lighting apparatus, and the exposure of the metal roof to the accumulation of snow, &c.

I think a careful record of the temperature of the space under the roof when the gas is lighted, and at other times, would be valuable.

Very respectfully submitted.

LEWIS W. LEEDS.

Report accompanying plans for the improvement of the ventilation and heating of the hall of Representatives, by Lewis W. Leeds, engineer of ventilation and heating, 110 *Broadway, New York.*

That, to warm a room by direct radiation, and supply it by cool, fresh, invigorating air for breathing, is necessary for health and comfort, is now so generally admitted that it scarcely needs any argument in its favor.

The great wonder now is, that so many very eminent engineers should have persevered so long directly in the face of continued failures in attempting to warm and ventilate large buildings by forcing in currents of overheated, debilitating air, at the same time allowing all the walls and solid objects in the room to be colder, and absorbing the animal heat—the very essence of life—from the inmates. The cause of these universal failures is well explained by the simple physiological fact that we give off twice the quantity of carbonic acid, or, in other words, that we live twice as fast, and can do double the amount of work, and need as much again food when we are breathing air from 10° to 20°, that we do when breathing air from 90° to 100°. This is well illustrated on any bright, clear day ; the warm rays of the sun, which are frequently of sufficient power to boil water, are very agreeable as they fall upon us while we are surrounded with and breathing the cold and invigorating air perhaps at 20° or 30° ; vigorous bodily or mental exercise is then much easier than on a sultry day in summer.

How entirely different are the conditions now existing in the house of Representatives. The air is taken in at the basement, down through the cellar ; from there forced up by the fan through an immense stack of rusty, dirty iron pipes, coated by many years' accumulation of particles of decaying animal and vegetable matter, roasted up afresh every day ; from thence driven through a labyrinth of uncleaned horizontal air-ducts, filled with the molding and decaying dirt of several years' accumulation ; and finally driven through the uncleaned spittoons arranged all over the floors of the house, issuing into the rooms at a temperature of 100° to 120°, a warm, filthy, disgusting mass for the members to breathe. I think it is time this was changed.

Not only does the application of direct radiation furnish a much more wholesome and agreeable atmospere, but it at once relieves us of much of that trouble about the proper circulation of the fresh and foul air that have so vexed the hot-air engineers. It enables us at once to dispense with those expensive nuisances, the fans. Most of the members no doubt have noticed the disagreeable smells and heat arising from the engine-rooms, and fans, and which fill the western stairways, especially on the side of the Senate. At times in the summer, when the doors are open and the wind from the south, this unpleasant odor and heat may be noticed on the east front—having filled the whole stairway, passed across the Senate chamber, and out the front. In summer this current adds several degrees of heat to the temperature of the upper rooms. By dispensing with the engines and fans a great gain would be at once effected, both in economy and comfort.

I know very well that many prominent engineers insist upon it that the fan is necessary to secure at all times the proper circulation of air. When dependence is placed

exclusively upon warming the whole building by currents of heated air, (which is al. wrong,) there may be some excuse for the use of the fan, but I think even then the heated shaft is more efficient. All question is avoided, however, as to the necessity for its use where we heat principally by direct radiation. The idea of heating by direct radiation is by no means a new one; it is much older than heating by hot-air currents.

But perfect success depends greatly upon the proper and skillful arrangement of the heating surfaces, in combination with the necessary supply of fresh air and the removal of foul, so arranged that a uniform movement of air shall be secured over the whole building without perceptible draughts.

Probably four-fifths, or not unlikely nine-tenths of all the air entering the building as now arranged comes in through the doors and windows; the other one-fifth or tenth being driven in by the fan, frequently at a high temperature, to counteract the cooling effect of that entering by the doors and windows. Now, by placing the heating surface directly under the external windows, that *really* becomes the very best place for the supply of fresh air. It enters then directly from the external atmosphere, thus avoiding the great objection to long, uncleaned air-ducts.

By leaving the heating surface exposed, we get the greatest direct radiation just where it is most needed—immediately under the cold window; the two extremes thus neutralizing each other. This arrangement was suggested by me, adopted by the Supervising Architect, and has been tested in the north wing of the Treasury, and with subsequent modifications in New York. It is found to work admirably. Those unpleasant cold draughts so commonly felt near windows are thus entirely prevented. The plans accompanying this report show where it is proposed to place the heating surface in the various stories.

I was surprised and very much pleased to find how readily an entire modification of the heating and ventilation could be effected without disturbing the general arrangement of the building in any important particular. It will be observed by reference to the plans that it is proposed to completely reverse the direction of the currents at the floor; and instead of the fresh (?) air entering through the uncleaned spittoons as at present, the foul air will be drawn off there. This change can be effected without at all interfering with the present arrangement of the supply by the fan—so that it may be reversed in fifteen minutes, and the fan can be used every alternate day until it is fully proved to be worse than useless.

It is proposed not to touch the present arrangement in any manner, but to leave the whole just as it is, to be used at any time to illustrate more strikingly the contrast. The old material would be of little value if removed.

SUPPLY OF FRESH AIR.

In previous reports much stress has been laid on the source of supply for the fresh air. Most of them contemplate conducting through underground passages of considerable length. I endeavor to avoid all underground air-ducts whenever possible, as the difficulty of keeping them sweet and pure is so great that it is seldom done in practice. Any damp place excluded from the direct disinfecting and purifying rays of the sun is liable to become mouldy, and this mould of such places is now considered to be the cause of miasmatic fevers.

When it is proposed to force the air over the entire building by fans from one or two points, this single supply may be of considerable importance; but with the heating surface distributed around the entire building as proposed by us, the difficulty is entirely overcome at once, and we admit the pure external air directly into the building without the least contamination.

And for the hall of Representatives we propose taking the pure air from the very top of the building—a higher point than proposed by any of the other parties. This fresh air will enter through the numerous perforations of the panels in the ceiling, and being *cooler* will fall gently diffused over the room; and as a large proportion of the heat will be derived from the direct radiation of the warmed walls, the effect will be very similar to that of a cool, bright day in spring or autumn.

Many persons suppose that a current of cold air on the head would be unbearable. This depends entirely on attending circumstances. I have frequently stood on the hot plates in the hold of a steamship, with my back to the hot boiler, and allowed a perfect torrent of very cold air to pour down upon me. The effect was delightful as long as my feet and back were kept thoroughly warm. But if you are surrounded by cold walls and a cold current strikes your back, especially between the shoulders, or makes the feet cold, that is very dangerous.

REMOVAL OF FOUL AIR.

With many of the projects for ventilation this seems to have been the primary object, but it is really secondary, the supply of the fresh air being of the first and greatest importance.

If a building is constantly overflowed with an abundance of cool, fresh, invigorating

air, and has an ample supply of heat from well-diffused heating surfaces around the exterior to prevent the inconvenience of cold draughts, there will be but little difficulty about the escape of the foul air.

It is better, however, and makes a more perfect arrangement, to provide for an ample and regular removal of foul air, sufficient to keep the rooms perfectly pure, even should all the windows and doors be closed for a long time continuously. By reference to the accompanying plans it will be seen that this is fully provided for.

In the first place, it is necessary to remove with care all offensive smells. With the present arrangement the heat, gases, and odors from the boiler and engine rooms are about the greatest nuisances in the building; then the heat and smell from the kitchen and restaurant in the cellar, as well as from the water-closets, permeate the whole building. All these would be carefully removed by the four large shafts connected with the smoke-stacks from the boilers. These are now doing very efficient service, but the odors from the boiler house, &c., ascend the main stairs, flow through the hall of Representatives across the attic down two of these flues to the bottom of the cellar again and up the other two and finally escape. Rather a circuitous route to make the foul air travel. Reminds one of the undertaker who carried the body of a person having died with the small-pox all through the town to show the people how careful he was in burying such. Instead of this we would propose, as shown on the accompanying plan, to open all four of these large flues directly from the cellar and engine-house, using three for the ventilation of the latter and one for the kitchen and water-closets. This will double the capacity of these flues, as the two now used for bringing the air down from the attic would be capped out above the roof, and make most efficient exhaust flues from the cellar and basement. The two on the eastern side would require a steam coil or furnace in each to increase the draught. The heat from the boilers causes an excellent draught in the others, as may be easily seen at any time on examination.

The capacity of these flues at 50 square feet area, with a velocity of 5 feet per second, would give a discharge of 15,000 cubic feet per minute, which would be about equal to the working capacity of the smaller fan.

Now, with this large exhaust from the cellar and basement, removing these offensive smells, one-half of the present difficulties would be removed. There would be much of the time a descending current on the main stairs, where there is now an ascending current.

The space behind the main stairs on the east front should be one-half used for a ventilating shaft from the cellar and basement at that end of the building, and the other half for an air-duct for forcing up cooled air for summer and for a hoist-way for ice, &c. The space behind the main stairs on the west, where the steam coils are, should be used as a ventilating shaft exclusively, for the discharge of foul air from the floor of the house. By shutting off all supply from below and opening an outlet above, as shown on the accompanying section, the whole current would be at once reversed; so that, instead of the current entering at that point, the foul air would be drawn off there, as it should be. This flue is 6 by 30, giving an area of 180, which, with a velocity of 4 feet per second, would discharge over 40,000 feet per minute. This in addition to the large amount that would be escaping from the ceiling at all times, and especially when the gas was lighted, would be double the quantity that would be generally required, and consequently must be throttled much of the time.

It is proposed to alter this main shaft in such a manner that it can be replaced in a short time, so that instead of its being an exhaust shaft it will be a supply shaft, just as at present. Where the fresh air supplied is colder than the temperature of the room, and the heat derived from direct radiation, a much less number of cubic feet answers for a healthful respiration; yet it will be seen we have a capacity for the discharge of air double the amount required under any circumstances whatever.

SUPPLY OF COLD AIR FOR SUMMER.

By removing the engines and fans, or allowing them to remain cold, one-half the trouble in this respect will be obviated, and by ceiling the space under the roof, as shown on the transverse section, also making a double ceiling over a large part of the main hall, will greatly improve the building in that respect. Also the thorough isolation and more complete ventilation of the lighting loft will relieve the main room of one very great trouble now existing, that is, the return of the air from the loft, loaded with the products of combustion and escaping gas, down over the galleries on to the floor of the House. By a series of experiments tried last year this was shown to be the constant action on three sides of the room.

It is believed that when these improvements are all made there will be but few days in the year when a forced ventilation (without the heating) would not be sufficient to keep the building comfortably cool.

The plans as submitted admit, however, of the most complete arrangement for cooling the air for ventilation. The cooling apparatus can be placed in the cellar near the

eastern end, and the cooled air driven up the shaft left for that purpose, as shown on the plan, or, perhaps better, the whole apparatus could be placed in the attic over the corridors and stairway, and if ice was used, it could be hoisted up the place shown for that purpose, or if water was used for cooling, it could be pumped up and used then.

DIRECT ADMISSION OF EXTERNAL AIR AND SUNSHINE TO THE HALL OF REPRESENTATIVES.

The opinion seems very prevalent that there is an absolute necessity for the admission of the external air directly into the hall, as well as the direct rays of the sun to give that freshness and vigor as well as purity to the contained atmosphere so desirable. There are, no doubt, good grounds for this opinion. There have been propositions for very considerable structural changes which would involve very great expense at the present high price of labor and material.

The suggestions we make, however, are very simple, not interfering in any way with the construction, and although not strictly architectural, perhaps, but as they are so insignificant and kept below the line of the balustrade they cannot be seen externally from any ordinary point of view. But in this very simple manner we let in a large amount of additional light, greatly needed on cloudy days, allow of the direct admission of an abundance of fresh air from the very top of the building, which is much more desirable than at any point near the ground, and, above all, allow of the admission of a very considerable amount of the direct rays of the sun.

SUMMARY.

If the suggestions herein contained are carried out according to the accompanying plans, the following advantages will be gained:

1. A cool, fresh, invigorating air over the whole building in place of the warm, overheated, debilitating stuff with which the building is now filled.
2. A gentle, well-diffused warmth from direct radiation, which is entirely different from and superior to the warmth derived from currents of heated air.
3. The feet and the backs of the occupants will be kept really warmer than their heads.
4. The hall of the House of Representatives will be overflowed with an abundance of pure external air with a much better light, and the admission of a considerable portion of the direct rays of the sun, never before admitted since its completion.
5. The whole apparatus for heating will be very nearly self-acting, as it is so thoroughly distributed on the external sides of the building no matter which way the air moves. North, south, east or west, or up or down, the warmth is nearly uniform, as currents of air do not affect radiant heat.

LEWIS W. LEEDS,
Engineer of Ventilation and Warming, 110 *Broadway, New York.*

3D MONTH, 16TH, 1869.

TELLIER'S REFRIGERATING OR AIR-COOLING MACHINE.

[To accompany drawing presented to Committee on Ventilation April 28th, 1870, by H. R. de La Reintrie, sole agent.]

Refrigeration produced by means of ice is necessarily imperfect and unsatisfactory. The action of the ice cannot be uniformly distributed throughout the room, but is felt more or less, according to the distance from the masses of ice. After a short time the ice in melting becomes so closely packed that the air ceases to circulate between the blocks, so that precisely as the season advances and the cooling action becomes more indispensable, the desired effect of the ice becomes less and less. Moreover, the atmosphere produced by this means is damp, moist, and heavy, and ill-adapted to the preservation of animal or vegetable matter. These inconveniences are all overcome by the machine which I am about to describe, the simple object of which is to produce cold air, and to drive it into the rooms to be refrigerated by means of a ventilator or fan. This machine presents four principal parts, viz:

I. A refrigerating cylinder, A.
II. A ventilator, B.
III. A compressing pump, C.
IV. A condenser, D.

The refrigerator A is a strong iron cylinder, closed at each end, *a*, *a*, *a*, *a*, within which are lodged a number of small tubes from one.half five-eights inch in diameter, part of which may be seen in *x*, *x*, *x*, *x*. All these tubes open freely into the atmosphere at both extremities of the cylinder. The latter is closed at each end by a metal disk, through which pass the extremities of the tubes *x*, *x*, *x*, *x*, so that whilst the interior of the latter is left perfectly free, the space circumscribed by the tube A

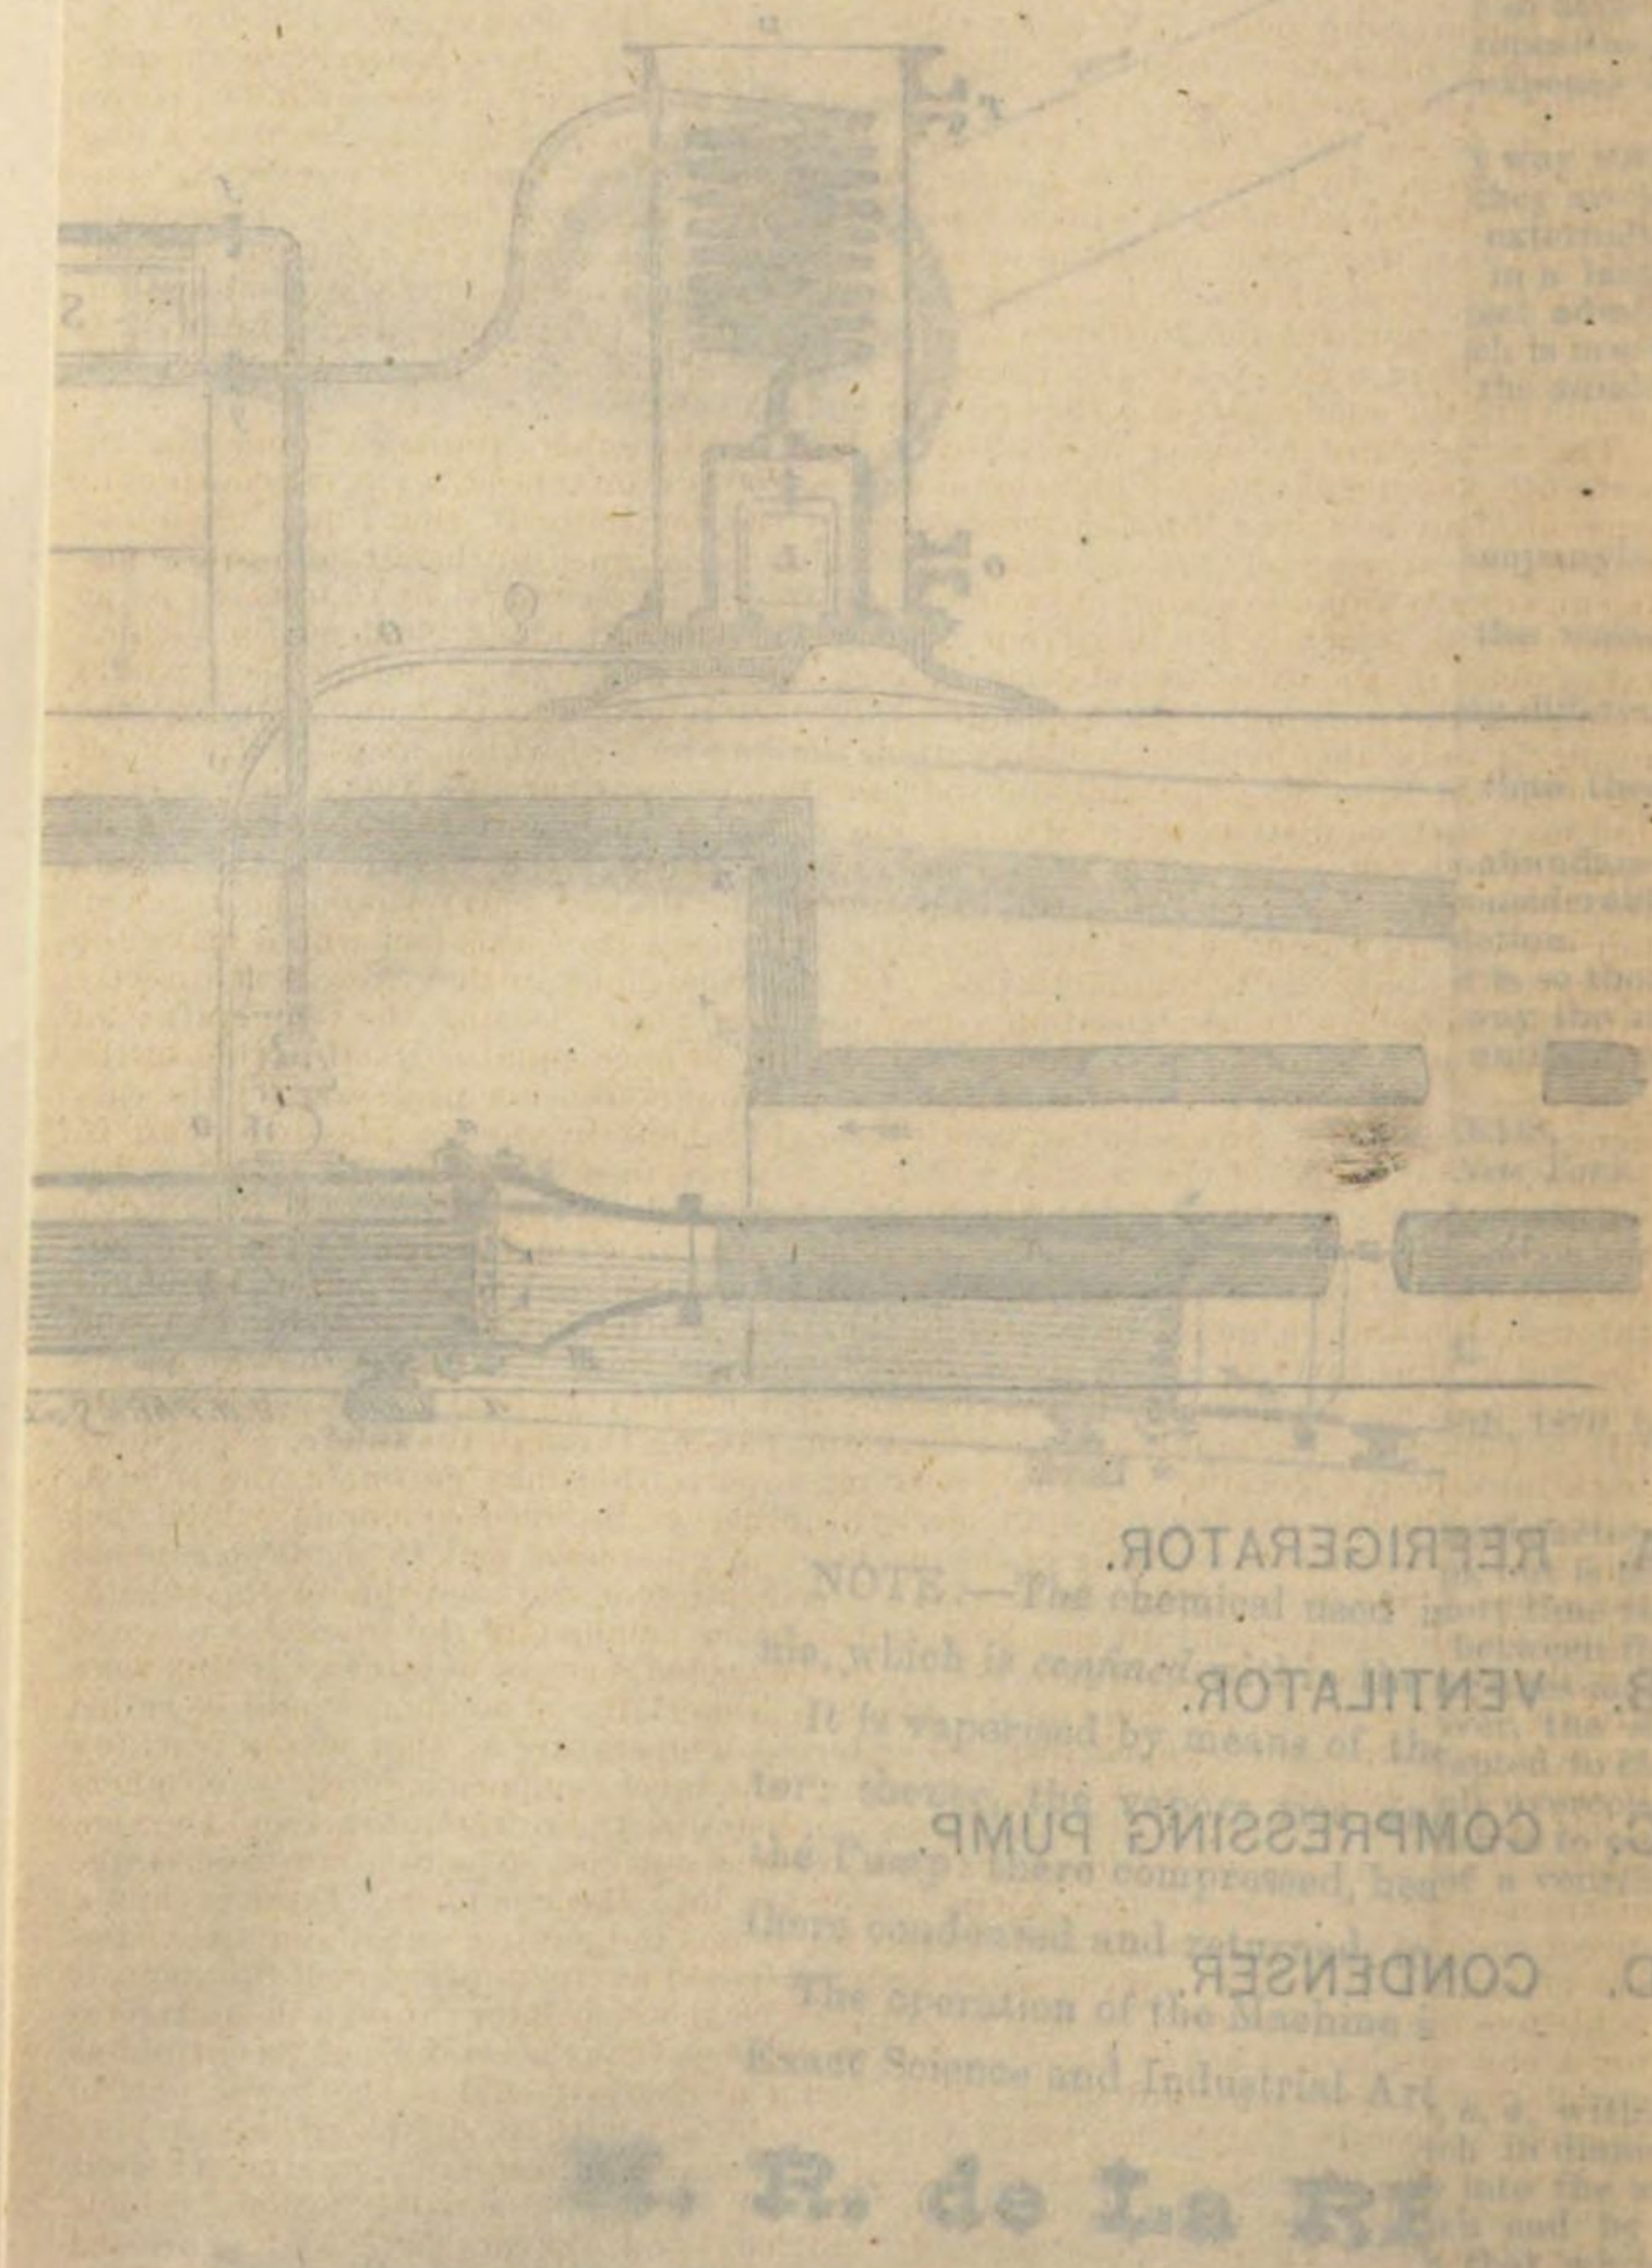
s *continuous*. It ranks to-day as an

.

EINTRIE,

Columbia, May 4, 1870.



and these disks forms, nevertheless, a strong and perfectly tight chamber. That this result may be the more perfectly obtained, a strong iron band, seen at each extremity, *a*, *a*, *a*, *a*, is welded on the cylinder, and thus strengthens the ends. The whole arrangement, being then carefully tinned and soldered, is heated and covered over with a coating of solder one-fourth to one-half inch thick, so that the whole forms one solid mass, without the possibility of any leak, as there are neither rivets, joints, nor nuts, save the two tubes of the cocks E and F, which are, themselves, set so as to form integral parts of the tube A.

I have nothing special to say of the ventilator B, which may be of any approved pattern.

The compressing pump C is worked by means of a belt passing over the block V. Its cylinder presents no other peculiarities, save that the valves, contrary to the prevailing custom, are placed: 1, the exhaust at the upper part of the cylinder, corresponding to the tube *f*; 2, the force valve, at the lower part of the same, corresponding to the tube *g*. By means of this arrangement, should any liquid be formed by condensation in the cylinder, it will be removed at every stroke of the piston. This cylinder is of cast iron, with an outer jacket, through which circulates a current of cold water, the object of which is to carry off the caloric produced by the compression. A cock, S, regulates the introduction of this water. The condensing column D is composed, 1, of a coil, G; 2, of a chamber containing a float, L, into which flows the product of the condensation. (See note at end.)

The refrigerator A, being now filled with methylic ether, liquefied ammonia, or some other analogous fluid, which completely surrounds the tubes *x*, *x*, *x*, *x*, if a continuous current of air be driven through these tubes by the ventilator B, that liquid is rapidly vaporized, carrying off with its vapors the caloric contained in the air, and thus causing an equally rapid lowering of its temperature. A degree very near to freezing point may thus be reached, but must not be passed. The abundant condensation which takes place in the tubes would then change *into ice*, and by obstructing them would soon clog the working of the apparatus. By merely getting to a point near 32°, the result is only an abundant condensation, the product of which may be drawn off through the tube M. The air, thus refrigerated, escapes through the conduits N N, and may then be distributed at will. I now return to the volatilization of the volatile liquid which takes place in A, the vapors escaping through the valve E. If the vapors thus formed escape freely into the atmosphere, the desired effect would be reached, but the vapors would be lost and the expense arising from this fact would make the operation, commercially, impracticable. On the other hand, if they were sent directly into the condenser D, condensation could not take place, because the temperature of A, being lower than that of D, the pressure would at once equalize itself to that of the cold vessel, and could not produce in D the maximum tension necessary for the condensation. Such is precisely the result brought about by the compression pump G. Under the influence of the motion which it receives from the belt, its cylinder fills with the vapors produced in A, which are compressed by the piston and forced into the condenser as soon as the pressure is sufficient to cause condensation. That the latter may take place in a constant manner a continuous current of cold water is brought through the tube *o*, going out through the tube *p*, after bathing the reservoir L and the coil *a*, thus carrying off all the caloric of condensation. As fast as the vapors are condensed, they are gathered in the chamber which holds the float L. When the quantity is sufficient, the liquid raises the float, and passing through the tube *o*, *o*, *o*, *o*, flows back into the refrigerator A. Thus constant vaporization may go on in the tube A, without reducing the level of the methylic ether or liquified ammonia, which fact secures the continuous working of the machine. A glass level may be made to connect the tubes E and F, and thus facilitate the verification of the condition of the tube A, which should always contain enough liquid to bathe completely the tubes *x*, *x x*, *x*, *x*, *x*.

I will now proceed to explain how the air, to be cooled, may be obtained. If this were drawn from the outer atmosphere, the machine, especially in summer, would be called upon to perform a tremendous task, the external temperature at that season reaching frequently as high as 90° and over. To avoid this inconvenience it is the atmosphere itself of the rooms which is drawn. To accomplish this, the refrigerator A and the ventilator B are both lodged within a chamber, open at one end, so as to allow the passage of the conduit N and the free admission of air into the chamber. There is thus a direct communication established between the rooms to be refrigerated and the chamber of the ventilator B. This opening being disposed at the upper part of the room, it is always the warmest air that is drawn, driven by the ventilator through the refrigerator A and discharged at the lower part of the rooms. Thus is established a continuous circulation of the same fluid mass, which, being discharged cold at the lower part of the rooms, absorbs the caloric which comes in contact with it, dilates, rises, carrying off this caloric, passing through the ventilating chamber into the refrigerator, where it again leaves off the caloric, and so on; the air being, in fact, but a mere vehicle for the heat which it alternately takes up and leaves off. Fears have been expressed that this constant circulation of the same air would not keep the atmosphere of the

rooms sufficiently pure. There need be no apprehension on that score. In the first place it is customary, whenever it is desired to keep a room cool, to keep it closed as tightly as possible; now to leave the air stationary or to cause it to circulate can make no possible difference. In cases where there is formation of carbonic acid gas, (as is the case in brewers' fermenting rooms,) it is perfectly easy to get rid of it, by mitigating the current with a certain proportion of fresh air, which will drive off a like quantity of vitiated air, and, in a given time, will completely renew the interior atmosphere. But this is not all; instead of being a cause of alteration, this circulation, on the contrary, produces a constant purification of the air. Under the influence of the absorption of the caloric, the hygrometic condition of the air is modified, and all the vapors it holds in suspense are condensed. This phenomenon leads to this consequence, that all the miasmas or impurities which might be in suspense in the air are carried off with this condensation. Thus the air is discharged purified, dried, and in the most favorable conditions for the absorption of such new vapors or miasmas as might be formed, which, by its continuous circulation, it will constantly carry off, leaving the interior atmosphere as pure and as cool as possible. The drawing, (sheet II,) shows the conduit N, as opening at the entrance of the cellar; it is hardly necessary to observe that this disposition, made necessary by the compulsory limits of a drawing, should not be carried out in practice, and that the cold air should be carried and discharged at the opposite extremity of the room, so that it may be compelled to pass through its entire extent before returning to the chamber of the ventilator; in this manner the desired effect is obtained in the most perfect manner.

H. R. DE LAREINTRIE,
Sole agent for the District of Columbia.

BALTIMORE, MD., *May* 4, 1870.

NOTE I.—The float L, at the base of the condensing coil, which is intended to regulate the flow of the liquid back into the cylinder, has been replaced by a patent spring cock, which effects the same object, whilst permitting at the same time to regulate exactly the pressure in the machine, and consequently to control perfectly its action.

NOTE II.—The lubricating cup, which appears on the compressing pump, and which is intended to lubricate the piston rod of the said pump, is so contrived as to act at the same time as a trap, to catch any vapors which might escape in that direction. As this is the only point where, from the peculiar construction of the machine, there could possibly be any leak, this contrivance effectually removes all such possibility.

Respectfully submitted.

H. R. DE LAREINTRIE,
Sole Agent for District of Columbia.

May 4, 1870.

I also refer the honorable Committee on Ventilation to Barnard's reports on the Paris Universal Exposition, chapter xii, pages 361 to 402, a valuable work.

LAREINTRIE.

OFFICE OF THE UNITED STATES (TELLIER)
ICE AND REFRIGERATING COMPANY,
61 *Broadway, New York, February* 16, 1871.

DEAR SIR: At the request of an agent for the District of Columbia, Mr. H. R. de La-Reintrie, of Baltimore, I beg to submit the following estimate of the expense of erecting and fitting up the Tellier refrigerating machines for the purpose of cooling the Houses of Congress. The object which it is proposed to accomplish is to reduce the temperature of the corridors surrounding the two halls some 20° below that of the outer atmosphere. These corridors, according to the figures obtained in the office of the architect of the Capitol, measure, in the aggregate, that is, both the upper and lower corridors, 184,019 cubic feet, or 6,818 cubic yards for the south wing, and 152,623 cubic feet, or 5,653 cubic yards, for the north wing, exclusive of the connecting corridors. The first step will be to isolate and protect as effectually as possible against the action of the outer atmosphere the parts to be so refrigerated. To that effect, partitions with double swinging doors must be erected at each end of the connecting corridors, and every door and window leading out from the corridors kept as securely closed as in winter. Communication, however, between the upper and lower corridors should be kept as free as possible in order to insure perfect circulation and thorough ventilation. The cold air coming from the machines will be discharged at the bottom of the lower corridors, where, mixing with the warm air, it will rise, passing into and through the upper ones to the ducts of aspiration which will be located in the latter, and at the fartherest possible point from the orifices of the discharge. Thus, there will always be maintained a gentle upward current which will constantly carry off whatever heated or vitiated air may rise from below, leaving the atmosphere as pure and as cool as pos-

sible. For it must not be forgotten that the process not only cools but purifies the air, and for this reason no apprehension need be felt on the score of the rooms being kept closed, as the atmosphere within will always be purer than that without, besides keeping out the dust, &c.

Apparatus will be required for each wing of sufficient capacity to discharge 10,000 cubic yards of cold air per hour at the temperature of 34° to 35° Fahrenheit. Were there no accretion of heat whatever into the corridors save that arising from natural radiation, this would maintain a temperature of 40° to 45° Fahrenheit; but in the present instance, with more or less caloric constantly pouring in from the floor and galleries of the Houses, and by the frequent opening of doors, 70° to 75° will be as much as may be expected, that being about the most comfortable temperature for the human frame, and such as usually prevails at Newport, Rhode Island, during the pleasantest weeks of the "season."

The total expense of applying and fitting these machines to both Houses of Congress I estimate as follows:

Refrigerating machines of the capacity named above, one for each wing, at $37,500	$75,000 00
Brick and woodwork, air conduits, &c., and to be executed according to our instructions, but under the direction of the Architect of the Capitol, if desired, for each wing $10,000	20,000 00
Contingencies	5,000 00
Total estimated outlay	100,000 00

These figures, save as to cost of machines, are mere estimates, and it is probable that the expenses covered by the second item will never reach that figure, nor is the last item likely to be called upon at all. A portion of the machinery will be brought from Europe. Should the Government see fit to remit the duties on same, the amounts thus remitted shall be deducted from the above figures.

The machines are to be located in the basement, and will each require a maximum motive-power of 25-horse. Each machine will also require a supply of water for purposes of condensation of 1,200 to 1,500 gallons of water per hour and will be provided with pumps of sufficient capacity to furnish the said supply; this water is in no wise injured by the process, its temperature being only raised some 4° or 5°, and may be conveyed anywhere to be used again for this or for other purposes. The machines complete will each weigh not to exceed 8 to 10 tons, and will occupy a space of about fifty feet in length by six feet in width; more, however, should there be a lack of height.

In making the appropriation to carry out the purposes of this estimate, I respectfully beg that one-third (33⅓ per cent.) of the first item, or amount required for the machines proper, be paid in advance upon the execution of a satisfactory contract.

All of which is respectfully submitted.

L. BOUVIER,
Acting President.

Hon. THOMAS A. JENCKES, M. C.,
Chairman Committee on Ventilation, Washington, D. C.

AGENCY OF THE TELLIER ICE AND REFRIGERATING COMPANY,
No. 34 *Post Office Avenue, Baltimore, February* 18, 1871.

DEAR SIR: Under date of yesterday Mr. L. Bouvier, now president of this company, informs me that on the 16th he mailed to your address the estimate of the cost of cooling the two wings of the Capitol building, in Washington, and which I trust you have already received.

At my request he has placed the estimate at the low figure of $100,000, that being one-third the amount proposed in the estimate of May 14, 1870, for cooling the two halls of Congress.

The machines will be constructed with the utmost care and in the very best style, will be highly finished and ornamented, with walnut casings, silver bands, &c., &c., so as to make them an object of admiration to the eye as well as to the mind. Of their efficacy and utility in the Capitol of the nation, I have no doubt whatever. We have put the price low, in consideration of the great benefits to accrue to us hereafter from their being thus prominently brought before the public.

Hoping the present estimate will meet the approbation of the committee, of which you are the distinguished chairman,

I am, sir, very respectfully, your obedient servant.

H. R. DE LAREINTRIE, *Agent.*

Hon. THOMAS A. JENCKES, M. C.,
Chairman Committee on Ventilation, Washington, D. C.

WASHINGTON, *February* 2, 1871.

DEAR SIR: At the suggestion of Mr. Jenckes I beg to state that we can, if desired, furnish you with a current of air from two of our machines, one for each House, at the temperature of 33 to 34° F., to be distributed or used as you may deem proper. The amount of air thus furnished will be of 75,000 to 100,000 cubic feet per hour for each House, and there will be required 18 to 20 horse-power, exclusive of the power required to fan the air into the dome. The cost of this would be about $25,000 for each House, and our principal profit from such an undertaking would be the advertisement we would get thereby. Will you be kind enough and see Mr. Jenckes in the course of the day, and see if you can come to some understanding with him in the premises.

Yours, truly,

L. BOUVIER.

EDWARD CLARK, Esq.

Mr. L. Bouvier, New York, and Mr. de LaReintrie, Baltimore, called to see Mr. Clark; will return again at about 11 o'clock a. m.

UNIVERSITY OF MARYLAND, *March* 28, 1870.

SIR: From what I know of the principle and the construction of the Tellier "refrigerating machines" and "ice machines," and from the results of their actual use in Europe, where they have been thoroughly and severely tested, they will, in my opinion, accomplish all that is claimed for them in your circular.

WILLIAM E. A. AIKIN, M. D., LL.D.,
Professor of Chemistry, &c., &c., &c.

H. R. DE LAREINTRIE, Esq.

COLUMBIA COLLEGE, NEW YORK,
President's Room, June 13, 1870.

DEAR SIR: I owe you an apology for not having sooner acknowledged your very complimentary letter of the 2d instant. There has been so unusual a pressure of occupation upon my hands as to throw all my correspondence into arrears.

I am very much gratified to see that the admirable inventions for producing intense cold, artificially, are beginning to be appreciated in this country as well as abroad, and I have no doubt that they are destined to be productive of very great public benefit. That of Mr. Tellier, in which you are interested, has great capabilities, and promises, I think, to be not only useful, but profitable to those who employ it. Meantime there seems to be springing up some controversy * among the different patentees in regard to their respective claims to originality. I sincerely trust that this may not be the occasion of preventing the public from reaping the full advantage which any one of these beautiful processes is capable of bestowing.

With my best wishes, I remain, very respectfully, your obedient servant,

F. A. P. BARNARD.

H. R. DE LAREINTRIE.

NEW YORK, *October* 20, 1870.

DEAR SIR: After spending nearly two weeks in making an exhaustive and critical examination of your Tellier ice machine, (No. 4,) now working at the Morgan Iron Works, and watching its operation through as trying circumstances as an ice machine ever worked, and seeing it produce ice at the rate of 100 to 120 pounds *per hour*, I have no hesitation in stating that I consider this machine the simplest and by far the cheapest as to construction, while the process itself is actually the most economical, in producing artificial ice, of any in use.

I have come to this conclusion after managing as chief engineer, for three years, the large works of the Louisiana Ice Manufacturing Company, in the city of New Orleans, where *six* large Carré's machines are in operation, and after examining critically *all* other machines now offered in the United States.

Respectfully, yours,

THOMAS F. PETERSON,
Chief Engineer Louisiana Ice Manufacturing Company's Works, New Orleans, La.

L. BOUVIER, Esq.,
Secretary United States Ice and Refrigerating Company.

---

* There is none about the Tellier patent. Professor Twining, after seeing the ice machine at work in New York, September, 1870, admitted that Tellier's machine was different and far superior to his, (Twining's,) never fully developed.

H. R. DE LAREINTRIE.

OFFICE No. 61 BROADWAY, *New York, October* 20, 1870.

My DEAR SIR: Inclosed herewith I send you a letter addressed to the company by Thomas F. Peterson, chief engineer of the Louisiana Ice Works in the city of New Orleans, giving his opinion of the merits of the Tellier ice machine. This, from the man who is the chief of the only ice works in the United States making 72 tons per diem, is praise indeed. He thinks it far superior to all other ice machines, and he has examined all, and knows more about ice machines than any man in this country. He is exceedingly enthusiastic about it, and has been up to the works every day and all day for the last two weeks.

What will Messrs. Carré & Co., do you suppose, say now? He is just as ardent an admirer of our refrigerator.

Very truly, yours,

SAMUEL C. REED,
President.

To H. R. DE LAREINTRIE, Esq., *Baltimore.*

The foregoing are true and correct copies of the original letters now in my possession.

H. R. DE LAREINTRIE,
34 *Post Office Avenue, Baltimore.*

FEBRUARY 8, 1870.

OFFICE OF BALTIMORE AND TEXAS STEAM TRANSPORTATION CO.,
No. 34 *Post Office Avenue, Baltimore, May* 14, 1870.

SIR: I have the honor to inclose, herewith, the following papers and drawings, viz:

No. 1. Proposal and estimate of the "United States Ice and Refrigerating Company," of the city of New York, of the expense of refrigerating and ventilating the two halls of Congress; the descriptions of "Tellier's refrigerating machine," the drawing of which was left with your committee on the 28th ultimo, and the specifications thereof, subsequently mailed to your address.

No. 2. Drawings, by Professor Seager, of the "spring cock A," and lubricating cup B, part of the machine.

No. 3. Descriptions of said spring cock A.

No. 4. Descriptions of the said lubricating cup and vapor trap B.

No. 5. My circular, with the addenda thereto, since attached to the same.

The attention of the committee is also called to the low estimate of cost in performing the entire work, of arranging and putting in place and working order the entire machinery on payment of $100,000, our account, in advance, the company guaranteeing to furnish all additional funds that may be requisite in perfecting the work, and taking all reasonable risks that may be required by your committee.

Attention is also respectfully called to the *small cost of fuel* for operating these machines, not exceeding twenty-five or thirty dollars per diem.

I have the honor to be, very respectfully, your obedient servant,

H. R. DE LAREINTRIE,
President, Sole Agent for the District of Columbia.

Hon. THOMAS A. JENCKES,
Chairman House Committee on Ventilation
of the Capitol of the United States, Washington, D. C.

No. 1.

OFFICE OF THE UNITED STATES ICE AND REFRIGERATING COMPANY,
No. 61 *Broadway, New York, May* 9, 1870.

SIR: Agreeably to the request made, on the 28th of April last, on the occasion of my interview with you, I beg to submit herewith the brief memorandum of a plan for cooling and ventilating the two halls of Congress.

I do not propose to enter, here, in the lengthy discussion of trite and obsolete theories on ventilation, nor attempt to demonstrate, by means of elaborate algebraic equations, the possible effect of very abstract causes. The facts which I shall endeavor to set forth before you will be such, only, as will fully stand the test of plain common sense and practical experience.

From such information as I have been able to obtain—and I have taken pains to consult parties both competent and experienced—I have reason to believe that the ventilation of the halls is neither as imperfect nor as deficient as many imagine; the main

difficulty lies, undoubtedly, in the absence of means to properly control the temperature of the rooms, both in summer and winter.

That there is very good, if not wholly sufficient ventilation, is shown by the following fact: the rooms, as is well known, are heated by indirect radiation—that is, by means of hot air from furnaces, supplied through ducts and flues.

No difficulty has ever been experienced, I believe, in maintaining constantly a sufficiently high temperature in the rooms. Now, this could not be done if the ventilation were particularly deficient, and for this reason: if a pipe containing hot water be led to a vessel, closed so as to allow of no egress, when the vessel has been filled so that no more water can enter it, the contents will, in a reasonably short time, cool down to the temperature of the ambient air. In the same manner, when hot air is brought into a room through a flue, unless there be a corresponding outlet, and consequently proper and sufficient circulation, a time must come when no more hot air can gain admission, and the atmosphere of the room, being stationary, must necessarily fall gradually until it approximates that of the outer air.

Disagreeable smells have occasionally been noticed in the halls, and the fact attributed, I think without cause, to deficient ventilation. If a person has been partaking of food seasoned with onions or garlic, or smoking strong tobacco, or drinking alcoholic liquors to excess, the unpleasant odors arising from his person and resulting from these facts will be quite perceptible within a moderate distance, even in the open air, and *a fortiori* in a closed room.

In the matter of temperature, the great difficulty is to suit at once the various temperaments and physical constitutions of the members. Warm and cold are but relative terms, which do not apply equally to every one and, as an illustration, I have heard it stated that the late William P. Fessenden was frequently known to shiver with cold in the same atmosphere which Mr. Hale, of New Hampshire, found oppressively warm.

It frequently happens that members will enter one or the other House at an early hour, to write letters, or for other purposes, and a temperature must be provided in which they may sit comfortably: but it is quite evident that when the hour of meeting has come, the floor has filled with members, and the galleries with spectators, each and every one generating more or less heat, this same temperature becomes almost intolerable.

What, therefore, is absolutely and pressingly needed, is a system by means of which the temperature of both halls may be kept under perfect control, and may be depressed at will, both in winter and summer, with even more rapidity than it can now be raised, whilst, at the same time, securing additional ventilation and a perfectly pure atmosphere.

Such are precisely the results which can be easily attained by means of the "Tellier Air-cooling Apparatus," a drawing of which has been left with your honorable committee by Mr. H. R. de LaReintrie, and a detailed description of the working and construction of which has since been forwarded to you by the same gentleman. I beg to refer you particularly to both of those documents.

The machines are now in successful operation in a number of establishments, both public and private, throughout Europe, among others in the great and well-known brewery of Messrs. Bass & Co., Burton-on-Trent, England, which fact will be found fully stated in Professor F. A. P. Barnard's report on the Paris Exposition, page 393. In this country it has also been introduced in the brewery of Mr. George Merz, New Orleans, where it is giving perfect satisfaction, producing and maintaining with ease *any desired temperature* in a room 50 by 50 and 12 feet high. That these machines are specially adapted to the purpose for which we are now tendering them, is shown by the following passage, quoted from Professor Barnard's report, already mentioned, page 391:

"The ventilation of churches, theaters, and all public assembly rooms during the warm season is another object to which these refrigerating apparatus may be made beneficially subservient. It is now generally true that during the warm days of summer the outer air is at a higher temperature than that within the building; and this will invariably be the case in structures of masonry, provided the windows be kept open during the night and are closed at sunrise. Notwithstanding this, a crowded assembly will find it intolerable, in summer, to sit in an apartment where there is no movement of air. The windows will be thrown open, the warm air admitted, and the assembly will be more uncomfortable than before. Nothing is easier, however, than to introduce into such apartments a steady flow of air at a temperature of refreshing coolness, by which the hot air shall be expelled, and a permanently comfortable atmosphere substituted. To accomplish this desirable object it will not generally be necessary to provide any special system of distribution for the cold air introduced. Our public buildings are in most cases already provided with ducts for conveying heated air in winter from furnaces to their several apartments, and the same channels will serve in summer for air artificially cooled. It will evidently be no less easy to control, by means of registers, the degree of depression of temperature in the apartments than it is, in the opposite season, to regulate the heat."

A glance at the drawing and specifications left with your committee will at once show how specially adapted our machine is to the above-named purposes. Of all ap-

paratus invented to produce artificial cold, it is the only one the construction of which is specially intended for purposes of ventilation and the cooling of air.

In adapting these machines to the ventilation and cooling of the halls of Congress, but few, if any, alterations would be required in the present arrangements of ducts, flues, and registers. These could easily be used to bring in the cold air; ducts of aspiration would, however, have to be established at some point or points near the ceilings, and as far as possible from the orifices of discharge, in order that the cold, fresh air may be compelled to traverse and permeate the entire atmosphere of the halls before finding an outlet. Thus the cold air, driven by the ventilating fan, enters the rooms at a point near the floors; there it meets the warm air, mixes with it, and as it becomes thus rarefied, it rises toward the ceiling, carrying off with it all the impurities or foul gases with which it may come in contact. At this point, the ducts of aspiration, which lead to the chambers of the ventilator, create a constant draught, and thus the warm, impure air is constantly drawn out of the rooms, carried to the ventilator, and again driven through the refrigerating cylinder, where all such impurities and foul gases are cast off in the shape of an abundant condensation, the product of which may be led to any of the existing drains in the building. The chamber of the ventilator shall also be placed in communication with the outer air, by means of a duct or flue, through which a steady stream of fresh atmospheric air shall be constantly brought to the machines; it is immaterial where this air is drawn from, as it is always purified and cooled in passing through the cooling cylinder. By these means, simple and rational in the extreme, it will readily be seen that constant renovation, constant purification, and constant cooling of the atmosphere in the halls will be perfectly and completely secured.

In addition to the various and obvious means of controlling the temperature of the rooms, the action of the machine itself may be regulated at will, by means of an improvement known as a *spring-cock*, which has been added to the apparatus since the drawing was made, of which you have a copy. We have annexed hereto (marked A) a diagram of this ingenious contrivance. Fears have been expressed of leakage of the material used in producing the cold; no apprehension need be felt on that score. Machines of various descriptions are being constantly built in this and other countries, which must be equally secure against leakage as the one of which we are now speaking, and there is no difficulty in obtaining that result. Of these particular machines, Professor Barnard, in his already twice-quoted report, speaks of "the very effectual contrivances for preventing the possibility of the slightest leakage through stop-cocks, joints, or stuffing-boxes." Reference to the drawing and detailed description of our machine will show, conclusively, that there is literally no possibility of leakage at any point, save at the stuffing-box of the pump. To obviate even this bare possibility the inventor has devised a peculiar contrivance, more ingenious still than the "spring-cock," and which serves the double purpose of lubricating the piston-rod of the pump and of intercepting any vapors which might attempt to escape in that direction. We have annexed hereto, marked B, a diagram of this clever piece of mechanism. Finally, and to quote once more from Professor Barnard's report:

"No leakage can take place here, (the stuffing-box of the pump,) as the alkali in the vapors, acting upon the oil of lubrication, would saponify the latter, and thus form an unctuous compound, which, while answering fully the purposes of lubrication, would effectually prevent any escape of gas."

From all that has been said above, it will readily be seen that we propose to ventilate the rooms by means of an *upward* current of air. In adopting this mode of ventilation, we have endeavored, whilst conforming ourselves to the simplest laws of nature, to obtain the greatest possible amount of comfort for the members who are compelled by duty to remain on the floors of the Houses, and have assumed that the comfort of the spectators, who occupy the galleries from motives of amusement or curiosity, was but a secondary consideration. Thus, in our system, the purest and freshest air in the room will always be in that part of the rooms occupied by the members, and their number being relatively very small, no material inconvenience can follow to the spectators above. If, on the contrary, a downward current were adopted, all the effluvia and foul exhalations from the promiscuous crowd in the galleries must necessarily, and despite any possible means of prevention, be swept down upon and to the great inconvenince and discomfort of the members below. Moreover, experience has shown that, although carbonic acid gas is theoretically heavier than atmospheric air, and whatever may be the proportion of that gas in the exhalations from living bodies, the foul air in crowded assemblages always tends to rise, and it is much easier to proceed in accordance with, than in opposition to, its natural tendencies.

In order the better to attain the aim and object of our plan, we would suggest the construction, immediately under the roofs which cover the two Houses of Congress, of ceilings of some neutral material, plaster and laths or simple boards. The roofs are of corrugated metal, and act as powerful conductors of both heat and cold. The construction of the ceilings named above would, under any circumstances, be an improvement on the existing state of things; but we do not make it a part of our plan proper, nor is the

expense of such included in the estimate furnished below. It would be difficult, with the rather limited information at our command, to enter into a minute and detailed estimate of the cost of applying our system to the two halls of Congress. In addition to our machines proper there would be required motive power to the extent of 40 to 50 horse-power for the Senate and 60 to 70 horse-power for the House. The motive power now in use could undoubtedly be made available, at least in part, and it must be remembered that the sole and only additional running expense resulting from the adoption of our plans will be the cost of the fuel required to generate the required power, and this will not exceed $25 to $30 per day, even when running constantly, and upon this point we challenge comparison with any other scheme or plan.

Basing ourselves upon such approximate estimates as we have been able to make of the number and size of the machines required, we beg to submit the following proposition: We will undertake to provide both Houses of Congress with such machinery and apparatus, including the required power, fitting up, &c., as will furnish the means of lowering, at any time, the temperature to 70° or 75° Fahrenheit, the atmosphere produced being maintained perfectly pure as well as cool, and the entire expense for both Houses shall not exceed $300,000, that sum covering all such profit as we hope and expect to realize from the undertaking. Further, if an appropriation of $100,000 be made for the purpose, we will undertake to execute the work to the entire satisfaction of Congress, spending a like sum and taking all further additional risk ourselves, and no part of the remaining $200,000 need be paid until the work has been so completed.

We are prepared to commence work at any time, and if placed in position of doing so by or before the 1st of July next, we think we could have it all done by the time Congress next assembles in December next, or very soon thereafter.

All of which is respectfully submitted.

SAMUEL C. REED, *President.*
L. BOUVIER, *Secretary.*

Hon. T. A. JENCKES,
Chairman House Committee on Ventilation.

BALTIMORE, *May* 14, 1870.

The within proposal and estimate is most respectfully submitted to the careful consideration of the honorable the Committee on Ventilation of the two Houses of the Congress of the United States by their very obedient servant,

H. R. DE LAREINTRIE,
Sole Agent for the State of Maryland and the District of Columbia.

Nos. 3 and 4.

Description of drawings A and B.

A. NOTE I.—The float L, at the base of the condensing coil, which is intended to regulate the flow of the liquid back into the cylinder, has been replaced by a "patent spring cock," which effects the same object, whilst permitting, at the same time, the regulating exactly of the pressure in the machine, and consequently to control perfectly its action.

B. NOTE II.—The lubricating cup, which appears on the compressing pump, and which is intended to lubricate the piston-rod of the said pump, is so contrived as to act at the same time as a trap to catch any vapors which might escape in that direction.

As this is the only point where, from the peculiar construction of the machine, there would possibly be any leak, the contrivance effectually removes all such possibility.

Most respectfully submitted.

H. R. DE LAREINTRIE,
Sole Agent for the District of Columbia.

No. 4 *bis*.

Description of lubricating cup and vapor trap, marked B.

The lubricating cup placed upon the piston-rod is cast on the jacket of the pump. Its object is to prevent any leakage of ammonia or methylic ether. It is composed of a piston *a a*, worked by means of a crank B, which forces the oil contained in the cup

c c within the stuffing box D D. The packing of the piston-rod, as plainly shown in the drawing, is in two pieces, E F, divided by a perforated ring, G. It is easy to understand that the oil, pressed by the piston *a a*, caused the valve *s* to drop down, escapes through the orifices *r r*, and is brought by the plunger *n* upon the ring G. Per contra, the vapors which might pass through the packing F rise in the chamber D D, pressing the oil upon the piston-rod, and consequently it is the latter alone which can possibly escape through the packing E. Thus, if care be taken to keep up the supply of oil in the cup, perfect lubrication will be secured, and at the same time absolute protection against leakage. Care should also be taken always to keep the plunger *n' n' n* in perfect condition, for the reason that with its assistance it is always oil which rises in *n* up to the valve; whereas otherwise, when the oil would be below the orifices *r r*, it would be gas, and if the valve *s* leaked the piston would act badly, and at the same time vapor would escape through the cup *c c*. Oil may be poured rapidly into the cup until the piston resists under the hand; then it may be certain that it is full. There can never be too much oil, as the consumption is always the same; but lack of oil would be bad. Watch this well, as there only is any chance of leakage. Use castor oil or glycerine.

Most respectfully submitted.

H. R. DE LAREINTRIE,
Sole agent for the District of Columbia

No. 5.

[Circular.]

BALTIMORE AND TEXAS STEAM TRANSPORTATION COMPANY.

Capital stock $200,000.

A joint stock company, chartered and organized* under the laws of Maryland, for the direct transportation of general freight between Baltimore and ports in Texas.

The steamers of this line will be provided with Tellier's (French) refrigerating machine, *guaranteed* by the patentees to keep fresh meats, fruits, &c., in perfect condition, in any climate, by means of cold air—without the use of ice.

The privilege of the exclusive use of this patent, for the transportation of fresh meats, &c., from Texas to Baltimore, their preservation and sale, within the State of Maryland, is vested in the undersigned.

A practical man is ready to superintend the beef business in Texas.

THE TELLIER REFRIGERATING MACHINE

Is the invention of Monsieur Charles Tellier, of Paris, France, a practical machinist of great experience and inventive genius. It has been patented in England, the whole of Europe, and in the United States. It is in actual operation in these countries, and also in the Argentine Republic; has been fully and publicly tested, and found to answer *all* the purposes to which it is applicable, and has produced the results claimed for it by its inventor and patentee. Fresh beef, mutton, and game *have been conveyed* from London to Rio, in the steamer "Rio de Janeiro," expressly fitted out for the purpose with the Tellier Refrigerating Machine, and, after a voyage of *twenty-one days*, were found to be in perfect condition. During said trip, and while on the equator and in its vicinity, the temperature in the refrigerating room was kept at from 32° to 33°, (Fahrenheit,) while outside it ranged from 105° to 107°, and the water itself stood at 80° to 90°.

Beef, which had been *six weeks* in the preserving room, was eaten at the Café Coraza, in Paris, by over forty gentlemen of the most fastidious tastes, who pronounced it of superior quality, delicious flavor, and in a perfect state of preservation.

Game and mutton kept *nine weeks* in Tellier's refrigerating room, in Paris, were eaten at a dinner given to Minister de Lavallette and pronounced in perfect condition. It is proposed to organize a company in Paris,† with a capital of $2,000,000, for the importation of fresh beef from the pampas of the "La Plata" to France, to consist of twelve steamers, each to be provided with the Tellier refrigerating machine. The proprietors of the "Grand Hotel," in Paris, are having one of these machines fitted up for the various requirements of that immense establishment, and which will soon be in running order. It is also in use in many other cities in Europe, and such is the present demand for it, that Mr. Tellier has been compelled to largely increase the area of his manufacturing building (4,100 metres) and the force of his operatives. In New Or-

---

* Organized May 4, 1870.
† "Société Maritime pour L'importation des Viandes du La Plata."

leans, Louisiana, it has been adopted and set up by Mr. Merz in his large brewery, and has proved a *perfect success*. A company has been organized in the city of New Orleans for the transportation of fresh beef from Texas to that city by means of the Tellier refrigerating machine, and prominent gentlemen of that city, headed by Mr. J. Viosca, jr., have paid the sum of $50,000 of the capital stock of $250,000 into its treasury, and the operations will commence so soon as the machines arrive from France and are fitted up in their steamers.

In the city of New York another company is organizing, having in view the business of introducing fresh beef in that great emporium by means of the Tellier machine.

It is contemplated to organize a company in Paris to transport fresh beef from Hungary and Gallicia to that capital in the Tellier refrigerating railroad cars, provided with this same machine, the power for creating the refrigerating being taken from the car wheel. The outlay is estimated at 450,000 francs, or $90,000 in gold, to furnish, daily, 15,000 kilos (33,000 lbs.) of beef. If the result gives but 10 centimes profit per kilogramme—(about one cent per pound,) a very moderate price—the profit would be for 300 days, say $15,000 \times 10 \times 300 = 450{,}000$ francs, *or one hundred per cent.*

To fit out a steamer for the transportation of 200 tons of fresh beef from Texas to Baltimore would require, (making full allowance)		$25,000
In addition, a cash capital of, say		15,000
Estimated outlay		40,000
The expenses of a proper steamer of 600 tons, including charter-party, running expenses, insurance, &c., per month	$4,000	
600 head of cattle, at $15 per head	9,000	
Slaughtering and shipping	1,000	
		14,000
Result:		
360,000 pounds beef, at 8 cents	28,800	
600 hides (80 pounds each,) at 10 cents	4,800	
24,000 pounds of tallow, at 10 cents	2,400	
Tongues, horns, feet, &c	600	
		36,600
Net profit *per month*		22,600

Or over 50 per cent. *per month* on $40,000 invested!

This *result* is irrespective of *other freight*, both to and from Texas to Baltimore, which at this day will pay, whenever a steamer is put on this line. The hides and tallow, (fifth quarter,) *alone*, will cover the cost of the beef in Texas, and, when landed in Baltimore, *in perfect condition*, transferred to a refrigerating room on shore, it can readily be sold for *one-half* the present, or future ruling prices. That it can be done, and "will pay," there is no doubt. Should any unforeseen contingency supervene, the margin of profits, *per annum*, is certainly ample.

The Tellier refrigerating machines range from No. 1 to No. 7, cost from $3,000 to $18,000 currency, will cool insulated rooms of from 110 to 4,660 cubic yards capacity, and are *absolutely guaranteed* to produce the degree of cold air required, *without the use of ice*, and at a very trifling expense. Were this not a fact, no man would make, sell, use, or recommend their use.

FREIGHT.

To point out to the intelligent and energetic merchant of Baltimore the many and positive advantages to flow from a direct communication by steamer between our rapidly-expanding city and the ports of Texas is unnecessary. Suffice it to state that such a line is required by the actual wants of the commerce of this metropolis and the oft-repeated wishes of the people of Texas for more immediate and speedy commercial intercourse. The existing trade is, of itself, an ample incentive to the prompt inauguration of this enterprise, and no doubt can be entertained that this commerce only needs development to insure, in the future, its realization on a scale greatly enhanced, through the facilities thus provided.

To the capitalist and business man it holds out a safe and remunerative investment of his means, with no greater risks than those involved in any other enterprise; combining superior commercial facilities with the ports of Texas and the introduction of beef of well-known and acknowledged quality, at prices much below the present, thereby benefiting the people of either State.

Conditions of subscription to the capital stock of $200,000.

1. Two thousand shares at $100 each.
2. Not less than five shares to be subscribed.
3. No installment to be called in until one-half the capital stock is subscribed.

4. Only one installment per month to be paid.
5. Said installment to be ten per cent. of the amount subscribed, by each stockholder.

A portion of the stock to be reserved for the patentees, for the exclusive privilege and use of the patent, by the company, for the transportation of fresh meats, &c., from Texas to Baltimore, their preservation and sale within the State of Maryland—subject to future agreement.

Your attention is invited to the consideration of this great enterprise, respecting which every desirable information will be cheerfully communicated by the undersigned.

Books for subscription to the stock now open at No. 38 Post Office avenue.

H. R. DE LAREINTRIE,
Sole Agent for the State of Maryland, and President of the Company.

BALTIMORE, *March* 17, 1870.

SPECIAL NOTICE.

UNIVERSITY OF MARYLAND, *March* 28, 1870.

SIR: From what I know of the principle and the construction of the "Tellier Refrigerating Machines" and "Ice Machines," and from the results of their actual use in Europe, where they have been thoroughly and severely tested, they will, in my opinion, accomplish all that is claimed for them in your circular.

WILLIAM E. A. AIKEN, M. D., LL. D.,
Professor of Chemistry, &c., &c.

H. R. DE LAREINTRIE, Esq.

ORDERS

Solicited for "Tellier's Refrigerating Machines," adapted to the refrigeration required in hotels, breweries, packing-houses, malt-houses, distilleries, fruiteries, dairies, alcoholic and all other establishments which need a cold temperature, which is guaranteed by the "Tellier Refrigerating Machine," without the use of any ice whatever and at nominal cost.

Orders also solicited for "Tellier's Ice Manufacturing Machines," distinct from the first above named. The ice made by this machine is in every respect equal to the natural, and has a greater density than the Boston ice. This has been tested and shown by experiment, at Marseilles.

They will be furnished, on notice of three or four months, on reasonable terms.

H. R. DE LAREINTRIE,
Sole Agent for the State of Maryland and District of Columbia, and President of the Company.

[American, May 4, 1870.]

[By telegraph.]

TELLIER MACHINE—GREAT SUCCESS.

"NEW ORLEANS, *May* 3, 1870.

"Machine working perfectly. Any temperature desired; all are practically convinced.

"F. M. MCMILLAN.

"To L. BOUVIER, *New York.*"

And to the truth of which I, on honor, hereby certify.

H. R. DE LAREINTRIE,
Sole Agent.

BALTIMORE, *May* 4, 1870.

[Gazette, May 4, 1870.]

TELLIER MACHINE.

Please insert in your estimable Gazette the following extract of a letter just received from New Orleans, dated May 3, 1870:

"In half an hour we cooled the cellar (Merz's brewery) from 78° to 59° F., and the cooling cylinder was 34°, while the exhaust pipe from cooling cylinder to condenser was so hot one could not bear his hand upon it;" and also that "both myself and all the brewers and engineers of the establishment present were perfectly convinced and satisfied of the success of the refrigerator." McMillan writes, "I can keep this large cellar cold upon one barrel of coal per day. After that I do not think any one need doubt that we can keep the hold of a steamship cold."

To all of which I hereby certify.

H. R. DE LAREINTRIE,
Sole Agent for Maryland and District of Columbia.

A true copy of the original.

H. R. DE LAREINTRIE,
President.

BALTIMORE, *May* 14, 1870.

THOMAS BOYD'S PLAN.

UNITED STATES INTERNAL REVENUE,
ASSESSOR'S OFFICE, FOURTH DISTRICT MASSACHUSETTS,
Boston, April 29, 1870.

DEAR SIR: I am informed that Congress has made, or proposes to make, an appropriation to try some experiments with reference to ventilating the Capitol. This induces me to respectfully ask your attention, and that of those who have this matter in charge, to Mr. Thomas Boyd's Solar System of Ventilation, by means of caps attached to the top of ventilating flues.

My attention was first called to the subject by being on a committee to consider the matter of ventilation for the Home for Little Wanderers. I made many inquiries, and put myself in communication with architects and all persons here whose experience qualified them to give useful information. The consequence was that we procured one of Mr. Boyd's large ventilators which is successful in changing the air in a large school-room with some thirty pupils, a large nursery with twenty to thirty small children, and a large entry on the lower floor, with water-closets and urinals. It combines the advantages of wind ventilators with the heating power derived from the heat of the sun, which is a vey great advantage. My object, however, is simply to invite attention to its merits.

If you can aid Mr. Boyd in gaining a hearing, by those who have this subject in charge, you will greatly oblige him, as well as

Yours, most respectfully,

OTIS CLAPP.

Hon. N. P. BANKS, M. C.

BOSTON, *April* 29 1870.

DEAR SIR: Having noticed that some action has been taken in Congress towards improving the ventilation of the halls in the Capitol, I am desirous of an opportunity to submit a system of ventilation that has proved successful on a large number of buildings here, and is, in my opinion, peculiarly well adapted to be useful there. For this purpose, I have been advised to introduce the subject to you, and respectfully request that you will have the kindness to present it to the gentlemen or committee having the matter in charge, and obtain from them permission for me to furnish a plan for their consideration.

Not having had the good fortune of being personally known to you, some friends have been kind enough to favor me with letters of introduction, one or two of which you will please find inclosed. I also send herewith a small pamphlet, descriptive of my system, explaining the principle on which it acts, and the kind of apparatus I use to procure and maintain ventilation. This will probably be sufficient at present to enable you to understand what I desire to offer.

Trusting that you may deem this of sufficient importance to the Government to excuse me for troubling you with it, I beg to remain,

Very respectfully, your obedient servant,

THOMAS BOYD, *Architect.*
(*Office No.* 28 *State street, Boston.*)

Hon. N. P. BANKS, M. C.

BOSTON, *May* 3, 1870.

DEAR SIR: Mr. Thomas Boyd, of Cambridgeport, who is well known in this city as a skillful and scientific mechanic and architect, is the inventor and patentee of a Solar System of Ventilalion which has been successfully applied to many of our public and private buildings, and is attracting considerable attention among scientific men. I understand from him to-day that he is about to make application to the authorities at Washington with a view to applying his system of ventilation to the Capitol and other public buildings there, and desires to secure, if possible, the attention of any committee of Congress having in charge the important matter in which he is interested.

Mr. Boyd has shown to me letters addressed to you in his behalf by the Hon. Isaac Livermore, Mr. Otis Clapp, and other gentlemen, certifying to his character and standing in this community, and asking your kind offices in his behalf, which it gives me great pleasure heartily to indorse. I have known him personally and professionally for many years, have seen his solar ventilators successfully tested, and have the utmost confidence in their practical utility.

Any aid you can render to Mr. Boyd, consistent with your many official engagements, to enable him to obtain a hearing, will be highly appreciated, not only by himself personally, but by his many friends in Boston and vicinity, and greatly oblige

Yours, very truly,

N. A. THOMPSON.

Hon. NATH'L P. BANKS,
Washington, D. C.

OFFICE OF THE HUNTOON GOVERNOR FOR STATIONARY
AND MARINE ENGINES AND WATER POWER,
Boston, May 10, 1870.

SIR: We are led to address you, on our return from a recent visit to the capital, during which time we attached, by order of the Department, two of our improved governors to the engines at the United States navy yard. If we are correctly informed, an arrangement by which a more uniform temperature could be maintained in chambers of the United States Senate and hall of Representatives would be met with favor by your committee.

We feel confident that in no way could this end be accomplished more completely than by maintaining in the engines employed for this purpose a perfectly regular and unvarying speed. We therefore very respectfully submit for your consideration the following proposition, which after our large experience in such matters we feel justified in making, thus:

With your permission we will attach to the engines of the heating apparatus of the United States Senate, our improved governors, entirely at our own expense, and without hinderance to the running of engines, awaiting, after a practical trial of the same, your acceptance or rejection. If pronounced sufficiently valuable, the entire cost to the Government will be $200 for each engine. If otherwise, we will remove them, leaving the engines exactly as at present, with no charge whatever.

Very respectfully, awaiting response at your convenience, I am your obedient servant,

J. AUGUSTUS LYNCH,
Treasurer, Proprietors Huntoon Governor.

Hon. THOMAS A. JENCKES,
Chairman Committee on Ventilation, &c., Washington, D. C.

It has been proved conclusively, after long practical trial, (the severest tests being hourly brought to bear,) that by the employment of the Huntoon governor the engine to which it is attached will run without any variation whatever in the speed, whether heavily loaded or running light, and wholly uninfluenced by the varying pressure of the steam.

The centrifugal or ball principle being entirely abandoned, the valve-lever is sustained as easily at one point as at another, by the action of the propeller in the oil cylinder; and from this fact, together with others peculiar to its construction, we are thus enabled to guarantee a direct saving of fuel, or greatly increase the power of the engine.

The ease and quickness with which it can be adjusted, to cause the engine to run either faster or slower, by simply changing the position of the weight on the lever, has been deemed in many establishments of much importance; which will enable the hot blast to be varied to accommodate the variableness of the external temperature.

Our pulleys which accompany each machine are so constructed as to insure great safety from accident to the governor belt, but where it is desired we attach a new device by which the instant any such accident should occur the engine is brought gradually to a stand-still.

Engine-builders and others who have investigated the principle and mechanism of the Huntoon governor, in recommending its use, have convinced their patrons that it possesses decided advantages over any ball or centrifugal device, and a sure proof of its economy in the use of steam commends it to the users of power generally.

Although its reliability is now proved beyond a doubt, on hundreds of engines where other forms of governors have failed, yet, if requested, we are perfectly willing to allow time for trial, and if in any instance its operation is not entirely satisfactory to our customers we shall not consider it a sale, and on its return we will pay all charges of transportation. However violent or sudden may be the changes, we warrant it to absolutely govern the engine.

It is a great favorite, from the fact of its compactness; it is noiseless, and from its peculiar construction requires but little care from the engineer, every bearing being of necessity lubricated.

References furnished from those now using them, in all branches of manufacturing business.

R. K. HUNTOON,
J. AUGUSTUS LYNCH,
Proprietors, 103 *State street, Boston, Massachusetts.*

SUGGESTIONS OF STEPHEN CULVER.

NEWARK, WAYNE COUNTY, NEW YORK,
May 13, 1870.

SIR: Yours of the 7th of April last, in reply to mine of a previous date, stating that any communication on the subject of the better warming and ventilation of the congressional halls would be considered, was duly received. Other engagements have prevented my writing earlier.

In this communication I intend to make only a few general observations relative to fundamental principles involved in warming and ventilating large buildings of the character of the congressional halls, reserving for a future paper matters of detail.

It may be borne in mind that in what I shall have to say I shall speak of the process of *warming* as a different one from that of *ventilation*. In other words, shall not use the term "ventilation" in such sense as to be expressive of the warming of an apartment, since the temperature of the air of an apartment may be raised to a degree which shall be genial, while at the same time it may be greatly vitiated. And, on the contrary, the air of a room may be pure and healthful, and at the same time of too low or too high a temperature to be comfortable. By *warming*, I shall mean the raising and keeping the temperature of the air of an apartment at a degree that would be genial to the occupant; and by *ventilation*, the continuous changing of the air of an apartment by the removal of that which is vitiated from within, and the replacement of it by that which is pure from without.

Because the warming and ventilation of the English houses of Parliament were rendered better than before by the delivery of air at the upper portion of the rooms, many theorists and some practical engineers in this country advocate that system as the very best, while, in fact, it is not, the result in the case referred to being only an instance in which natural laws are opposed, and, to a limited extent, successfully overcome, thereby accomplishing a desired end much less perfectly and at much greater expense than might have been done by another method.

The delivery of air-currents into large halls at the top involves great expenditure for power to move and for conductors to convey them to the apertures of delivery; and when done, that only has been accomplished which could have been effected more perfectly and at much less expense by proper apparatus and delivery at the bottom. When air-currents are delivered at the top, and a corresponding quantity of air is removed from the bottom—the only proper place for removal—the general current in the apartment is as strong as in the case of the delivery at the bottom, for the reason that if, in connection with and as a part of each method, the air be withdrawn from the bottom, an equal quantity in each case would in equal times be moved to the apertures of discharge.

If air-currents be admitted at the bottom of an apartment they at once rise to the upper and highest portion of it—to the very place to which they are conveyed by costly appliances by the method called "downward ventilation." Besides, if the vitiated air be withdrawn from the bottom of the apartment the currents of replacing air will readily, naturally, and in sufficient quantities, flow into it; and if properly admitted and distributed, are unfelt and unperceived.

One of the principal causes of failure in the endeavor to warm and ventilate large spaces is, that the attempt is made to accomplish the object through the agency of a much too limited supply of air, the practice being to depend upon a comparatively small quantity raised to a comparatively high temperature. The quantity employed should be very much larger than is usually provided, and should not be raised higher than the temperature of surfaces heated by steam of pressure not exceeding 10 pounds to the inch.

Another difficulty encountered is, that by the usual process of heating, the air delivered to the apartments has an odor imparted to it, and also a quality which produces an unpleasant sensation when respired. These conditions are caused by the faulty construction of the heating surfaces by which the air-currents are detained in contact with them too long a time. The contour of all heating surfaces should be such as to permit the impinging currents to leave freely and without detention; and all air-chambers and conductors for the supply of air should be so constructed as to afford a speedy passage, without compression or obstacle to retard.

The proper method, therefore, for warming and ventilating large spaces, such as the congressional halls, is, to deliver at the bottom of them, in sufficiently large quantities, at proper localities, through properly constructed diffusers, air warmed by surfaces heated by steam of low pressure, and the withdrawal of equally large quantities from the bottom of the apartments through sufficiently numerous and properly constructed and located exhaust-orifices, the withdrawal being effected by mechanism actuated by a properly adapted steam-engine; no apparatus except a suitable system of conduits, and no extraneous mechanical power being required for the delivery of the air *to* the apartments.

An opinion has been expressed, as stated in some of the public journals, that there

could be no efficient ventilation of these halls without the removal of the lobbies. Such, however, is not the fact, for, by proper appliances, all parts of the halls could be well ventilated without such removal. By the employment of apparatus commensurate and properly applied, any large space, however irregular in form, can be as well warmed and ventilated as a small one.

Should the committee desire suggestions relative to any particular points, I should, at any time, be pleased to furnish them.

Very respectfully,

STEPHEN CULVER.

Hon. THOMAS A. JENCKES.

PROPOSITION OF WILLIAM WHEELER HUBBELL.

To the Committee on Ventilation of the House of Representatives:

Referring to my proposition submitted, I now say that I have examined the existing construction for ventilation and heating, &c., and do not propose to alter or impair any of it; but can adapt the principles of my invention or system to the existing constructions, to answer every purpose. I therefore propose—

1. To let cold water flow through the steam-heating pipes in summer and use them for steam, as heretofore, in winter.

2. To throw a large fine cold water spray, with double supply head, at the air-supply mouths to the existing blowers on the outside of the building, arranged as I will direct.

3. To let the engineers have a supply register from the hall blower, and run it at speed for this addition, arranged as I will direct.

4. To place the escapements on the roof, constructed and arranged as I will direct.

5. For winter use, to moisten the air, I use a steam spray near the steam-pipes to heat and to insure proper moisture; in very hot weather I admit a very fine steam spray discharge at the eye of the blowers; very little steam will do in summer, just to properly moisten the air without heating it.

I will put in these improvements for the sum named in my former communication, and will give specific details of sizes, forms, construction, &c., as required.

6. There should be a ventilating column with proper ornaments, &c., to suit general appearance of the Capitol—provided, after the other work is put in and in operation, I shall find that its proximity to the supply-mouth will not affect the temperature or quality of air at that point. The cost would be about $3,000 additional, properly constructed. It may not be essential or material to place it there, and hence I do not propose now to add it. The registers I shall put in will dispel some of that heat, and possibly be all-sufficient.

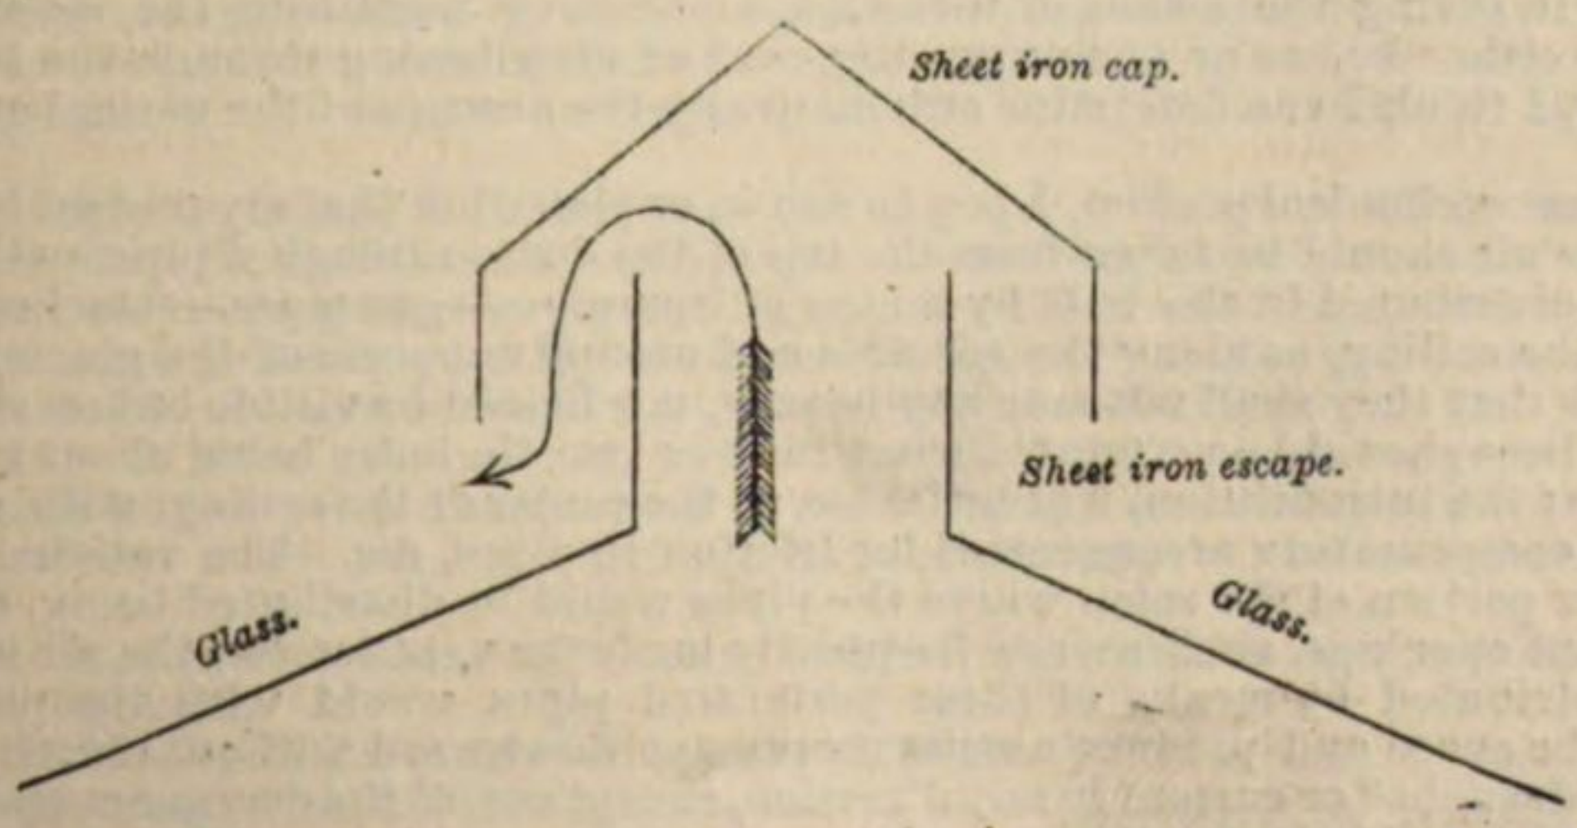
Respectfully,

WM. WHEELER HUBBELL,
340 *Pennsylvania Avenue.*

PLAN OF WILLIAM WHEELER HUBBELL TO VENTILATE THE HOUSE OF REPRESENTATIVES.

To the House of Representatives, or Committee on Ventilation United States Capitol:

Place five escapes on the glass roofing, covered thus, made of sheet-iron:



TO SUPPLY FRESH AIR.

Make a cold-air connection with the supply-furnace pipes, and use a fine jet of steam to accelerate and moisten the supply in hot, dry weather, with a waste pipe or opening to let off the condensation, and admit the fresh air into the House through the registers, that it may be disseminated without too much current at any one place. Have proper cut-offs so that the arrangement may be used both in winter and summer, for both heating and cooling the House.

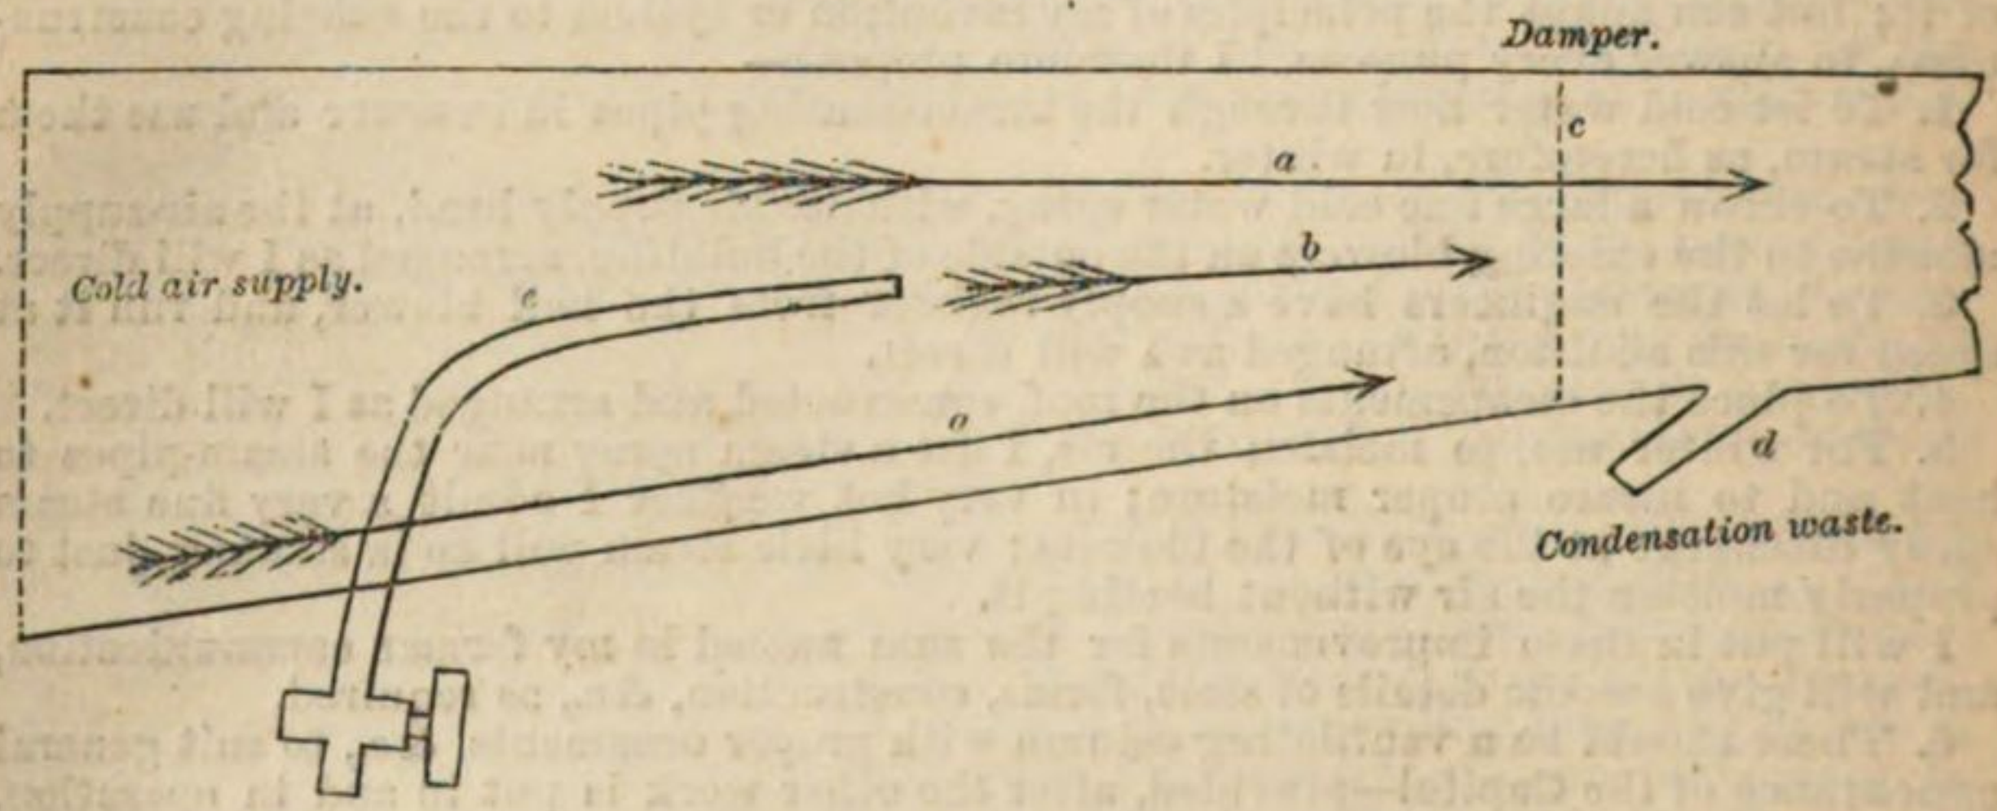
I will put in this arrangement so that it shall answer the purpose for $12,000.

To conform to the action of the House already had, I will put in the arrangement with the experimental fund appropriated, and if the House is satisfied with it the balance of the $12,000 shall be paid to me, and if not satisfied with it then nothing more need be paid to me for it.

WM. WHEELER HUBBELL,
Inventor and Scientific Engineer, Philadelphia, Pennsylvania.

WASHINGTON, D. C., 340 *Pennsylvania Avenue, May* 14, 1870.

PLAN OF SUPPLY.



a a, Arrows indicating course of air-supply to register-pipes; *b*, coinciding steam-jet one-quarter inch; *c*, damper; *d*, condensation waste; *e*, steam-jet supply-pipe to moisten the air and accelerate the supply.

WM. WHEELER HUBBELL.

MAY 14, 1870.

PROPOSITION OF R. H. ATWELL.

23 COURTLAND STREET, *Baltimore, June* 11, 1870.

SIR: I am informed by a member of your House that your committee (on ventilation) receive propositions for plans of ventilation applicable to the auditorium and give them a respectful consideration. I will, with your leave, give a very brief statement of my plan involving the use of power. If it should prove to be at all worth while I will elaborate it, giving the means of filtration, moistening, measuring the moisture automatically either before or after warming, and of distributing through the hall, and if necessary, I think I can determine automatically the absence of the normal quantity of oxygen.

As to the mechanical portion, I beg to say in explanation that my present impression is that the air should be taken from the top of the dome through a pipe, probably tinned, and distributed in the hall by means of iron pipes—gas pipes—attached to every angle of the ceiling, as along the cornices and around supports of the glazing, in such manner as that they shall not mar any beauty, nor indeed be visible but on close examination; these should be perforated every inch or two, the holes being about the twelfth of an inch; the introduction, if practicable, at the center of the ceiling, with, as regards delivery, compensatory arrangement for friction in pipes, &c. The rationale is thus: the higher portion of the room where the pipes would be distributed being, or made to be, without openings, such as are frequently made for ventilation; the air introduced being distributed by means of these perforated pipes would with the proper pressure fill the space and produce a mass movement downward without exciting what is called a "draught" or current in any direction, except out, at the doors or crevices or windows, at will. This is strictly in accordance with natural laws. The force the animal

exerts in expiration is always downward, and a pause always succeeds it sufficiently long for the carbonic acid to pass away and cool before an inspiration succeeds, as you are aware carbonic acid, which is chiefly to be regarded in the matter, is of considerably greater specific gravity than atmospheric air and should always be expelled downward. It may be questioned whether it ever reaches the ceiling in your hall, but it probably becomes cooled a few feet above your heads, and is precipitated upon you and inhaled again with all its added horrors of uncleanliness and disease.

This plan would possess the advantage of not being very expensive, though this should be no consideration if a better plan can be carried out at greater expense.

Yours, truly,

R. H. ATWELL.

Hon. T. A. JENCKES, *Washington*.

PLAN OF WILLIAM LOUGHRIDGE.

BALTIMORE, *June* 11, 1870.

DEAR SIR: Some time since my attention was drawn by a newspaper paragraph to an effort on the part of Congress to improve the ventilation of the House of Representatives. I wrote my friend Hon. Wm. Loughridge, of Iowa, who told me that he had spoken to you as chairman of the committee having the subject in charge, and that you had kindly promised to give me an impartial hearing.

I received from Mr. Loughridge, last week, a notice that you were approaching your report, and I answered him I would send in my plan this week; I have found it impossible to do so before next Wednesday. If that will be in time I will forward my plan; if not, I beg of you not to delay your report on my account.

I think that it is entirely feasible to give entire satisfaction on that subject, but as the ablest minds in the world have failed so often, I may be mistaken. It is simply a question of enough pure air to each member of your honorable body, without respiring it, or part of it, a second time. I think the present means to force the air is sufficient and that no very expensive alteration need be made to accomplish the work.

Respectfully, yours,

WM. LOUGHRIDGE.

Hon. THOS. A. JENCKES, *Washington, D. C.*

BALTIMORE, *June* 28, 1870.

DEAR SIR: I went to Washington on yesterday, and found your favor notifying me of your return home, when I got back.

I left with Hon. Wm. Loughridge a rough drawing and specification, giving the outlines of my plan.

It was hastily gotten up, but I believe the essential points necessary to a perfect ventilation are in it. I was in the galleries for about one hour, and from the free exercise of fans, &c., I saw plainly that the ventilation in the hall below was far from satisfactory. I also observed a material change in the atmosphere from 10 to 11 o'clock, before the hall was occupied, until 11 to 12, after it was occupied. I also observed yesterday (but could not last week from the point I stood, the galleries being full, and I was never in the hall or galleries before) that there was more register surface than I expected, and that there was more egress at the ceiling than I expected to find.

To effect a perfect ventilation the force that sucks or creates a vacuum above the ceiling must be nicely adjusted so as to attract all the impure air from the hall. Evidently as the air enters the hall, as it becomes rarefied, it expands, therefore the area for egress must excel the area of aperture for the ingress of the air, or the suction force must be greater so as to give in velocity of the air what it lacks in apertures of escape.

I am strongly impressed with the necessity and great utility of using the desks or parts of the desk for registers. I can increase the register surface at each desk at least 20 feet; this would increase the present register surface to at least 4,000 feet; as a consequence a much greater quantity of air can be forced into the hall with a much less average velocity, thus obviating the serious objection to a draught.

It seems to me if one row of desks were equipped in the manner I suggest, that a fair sample of my plan could be observed. I do not think any man living can exactly foresee the result of any mode, but I think that a little experiment would insure ultimate success.

I believe the present hall can be made to give entire satisfaction at a less cost than my former estimate.

I take the liberty of clipping the inclosed editorial.

Yours, truly,

WM. LOUGHRIDGE.

Hon. T. A. JENCKES, *Washington, D. C.*

BALTIMORE, *June* 23, 1870.

SIR: In answer to your favor of 20th instant, I respectfully submit the following plan for a more perfect ventilation of the hall of the House of Representatives. I wish this to be regarded as the outline or leading principle of my plan, subject to alteration and modification, so as to be adapted to the present construction of the hall. I believe the change can be made at a less cost than $75,000, and when completed that it will give entire satisfaction in supplying to each member of your honorable body an abundance of air from the present point of supply, attempered, during all seasons of the year, to any degree Fahrenheit.

I do not propose theorizing upon the philosophy of ventilation, the component parts of air before and after respiration, the cubic feet each person requires per minute, the advantages of an upward or downward movement of the air, &c., as these are after considerations, and able articles, (arrived at by experiment,) may be found in the "New American Cyclopedia," vol. 16, page 208, and elsewhere. I simply propose a plan that, in my opinion, is adapted to the hall of the House of Representatives *as now constructed;* and that will at all times, regardless of all contingencies common to ventilation, supply to each person within the hall a sufficiency of air, capable of being increased or diminished at the will of the engineer for the hall, or of each member at his own desk, without interfering with the comfort of other members.

The nature of my invention consists—

Firstly. In distributing the air which may enter the hall in *equal proportions at each desk*, and at other points where respiration takes place, *and at a low velocity through large areas so as to prevent a draught.*

Secondly. In conveying all impure air after respiration, &c., upwardly, through a perforated ceiling of glass, or other material, in nearly perpendicular lines from the point of respiration, by creating a vacuum beyond the points of egress by suction fans, or other artificial devices, so as to regulate the upward velocity of the air from the point of ingress (near the floor) to the point of egress, (at the ceiling,) so that it shall rise at all parts of the hall in a body and move at any *graduated* velocity in feet per minute, and that the line between the pure and impure air shall at all times be nearly parallel with the surface of the floor.

Thirdly. In deflectors arranged under the desks, with universal joints, to enable each member to conveniently deflect the draught upon the floor, or upon or from his person, or in any other direction at his pleasure.

I regard the present hall of the House of Representatives as well suited for my mode, and the present steam-engines, fans, &c., as, perhaps, of sufficient power for the work. I am of the opinion, however, that the present locality from which the air is drawn to supply the hall is objectionable. At times the air is impregnated with a malarious poison arising from the Potomac, and the decomposition of animal and vegetable matter around the city. I incline to the opinion that a much purer atmosphere would be obtained by running pipes some distance northeastwardly into the country, to a point where a reliable water-power could be had to force pure air into the public buildings, at much less cost than with steam engines as a motor.

The gist of my plan is, to supply equal quantities of air to equal areas of surface within the hall, and as nearly as possible in imitation of the open atmosphere. Any system that will not deliver to each person his proportion of all the air forced within the hall must fail to give general satisfaction.

Air, like "Benton's buffalo," or projectiles, follows straight lines, unless diverted from its course, and the greater quantities flow to the larger apertures; therefore, the apertures admitting the air, as well as those giving it egress, should have areas in proportion to the pressure of the air at all points, so as to equalize the inflow and outflow of the air into and out from the hall at every point.

Air is subject to the laws of gravity, force, resistance, inertia, and momentum; but there is no natural law that induces it to search through large audiences for the purpose of administering oxygen to those in want of it; therefore, with the present plans of construction, with but few openings to admit air into public halls, the air is carried at *high velocities* beyond the point of respiration, and the greater proportion of it is not utilized proportionately by the audience.

For plan and specification see annexed paper B.

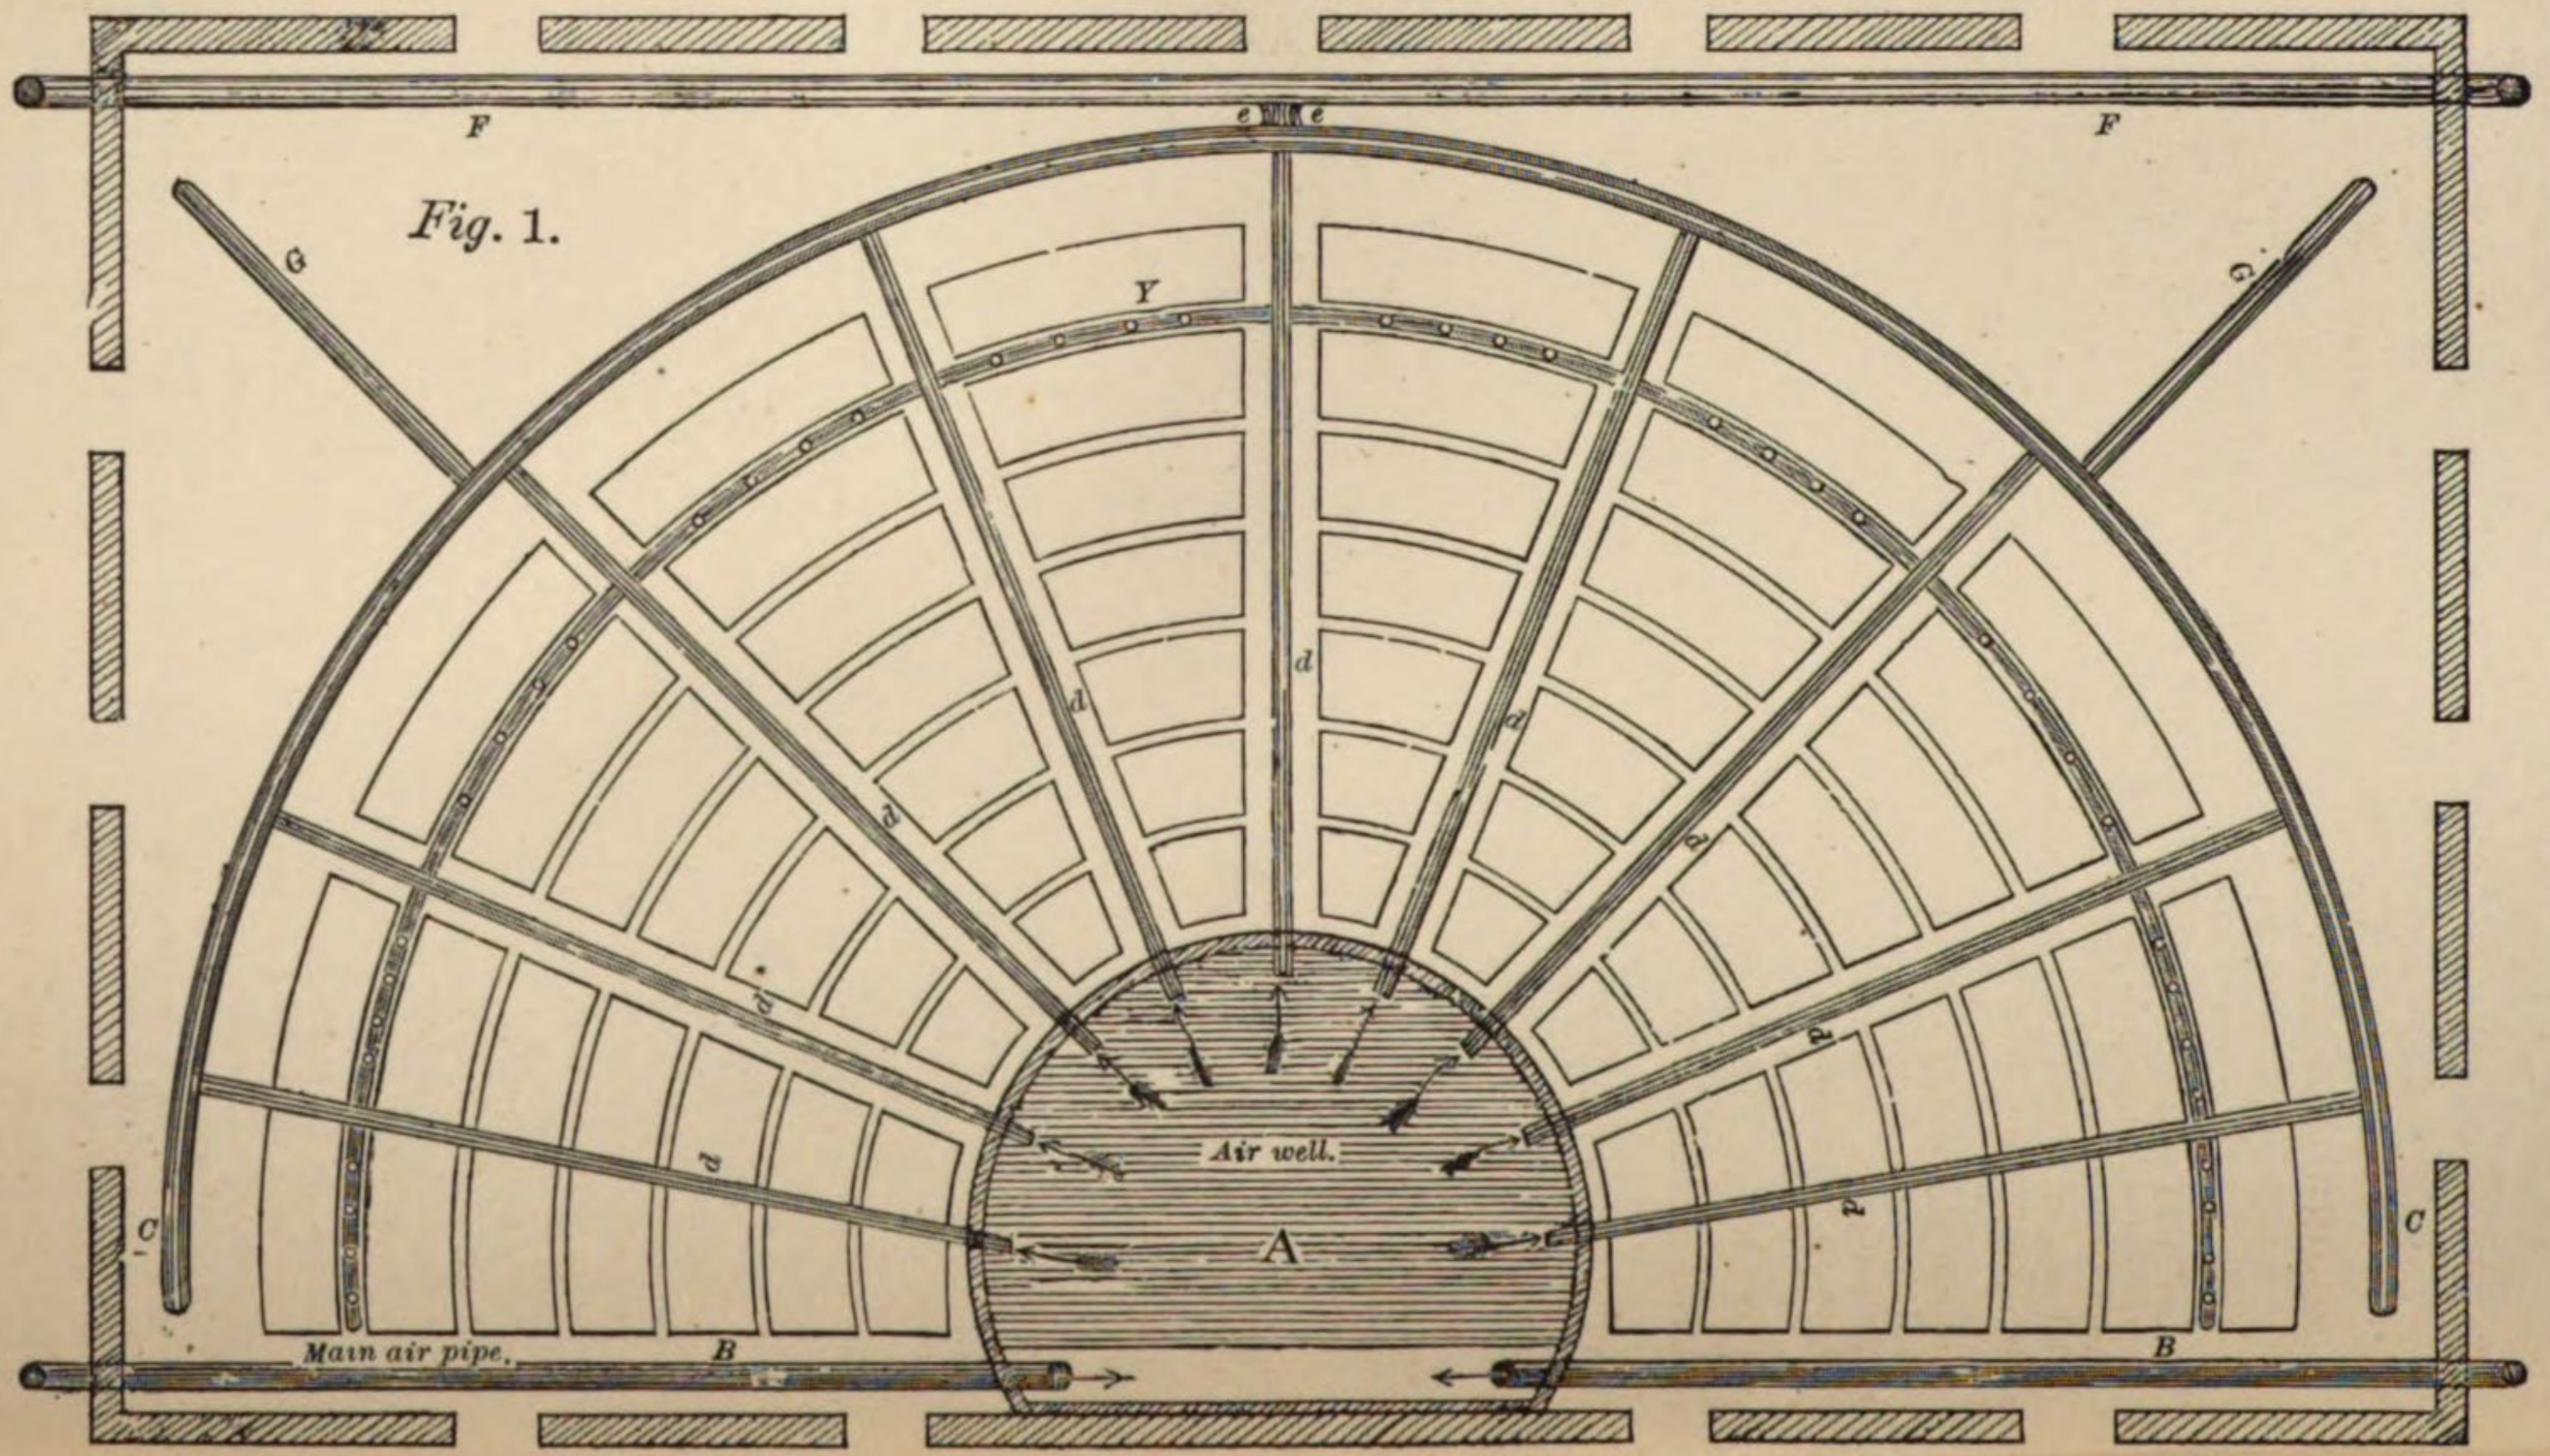
Yours, very respectfully,

WM. LOUGHRIDGE.

Hon. T. A. JENCKES, *Washington, D. C.*

WILLIAM LOUGHRIDGE'S PLAN FOR VENTILATING THE HALL OF THE HOUSE OF REPRESENTATIVES.

Fig. 1.



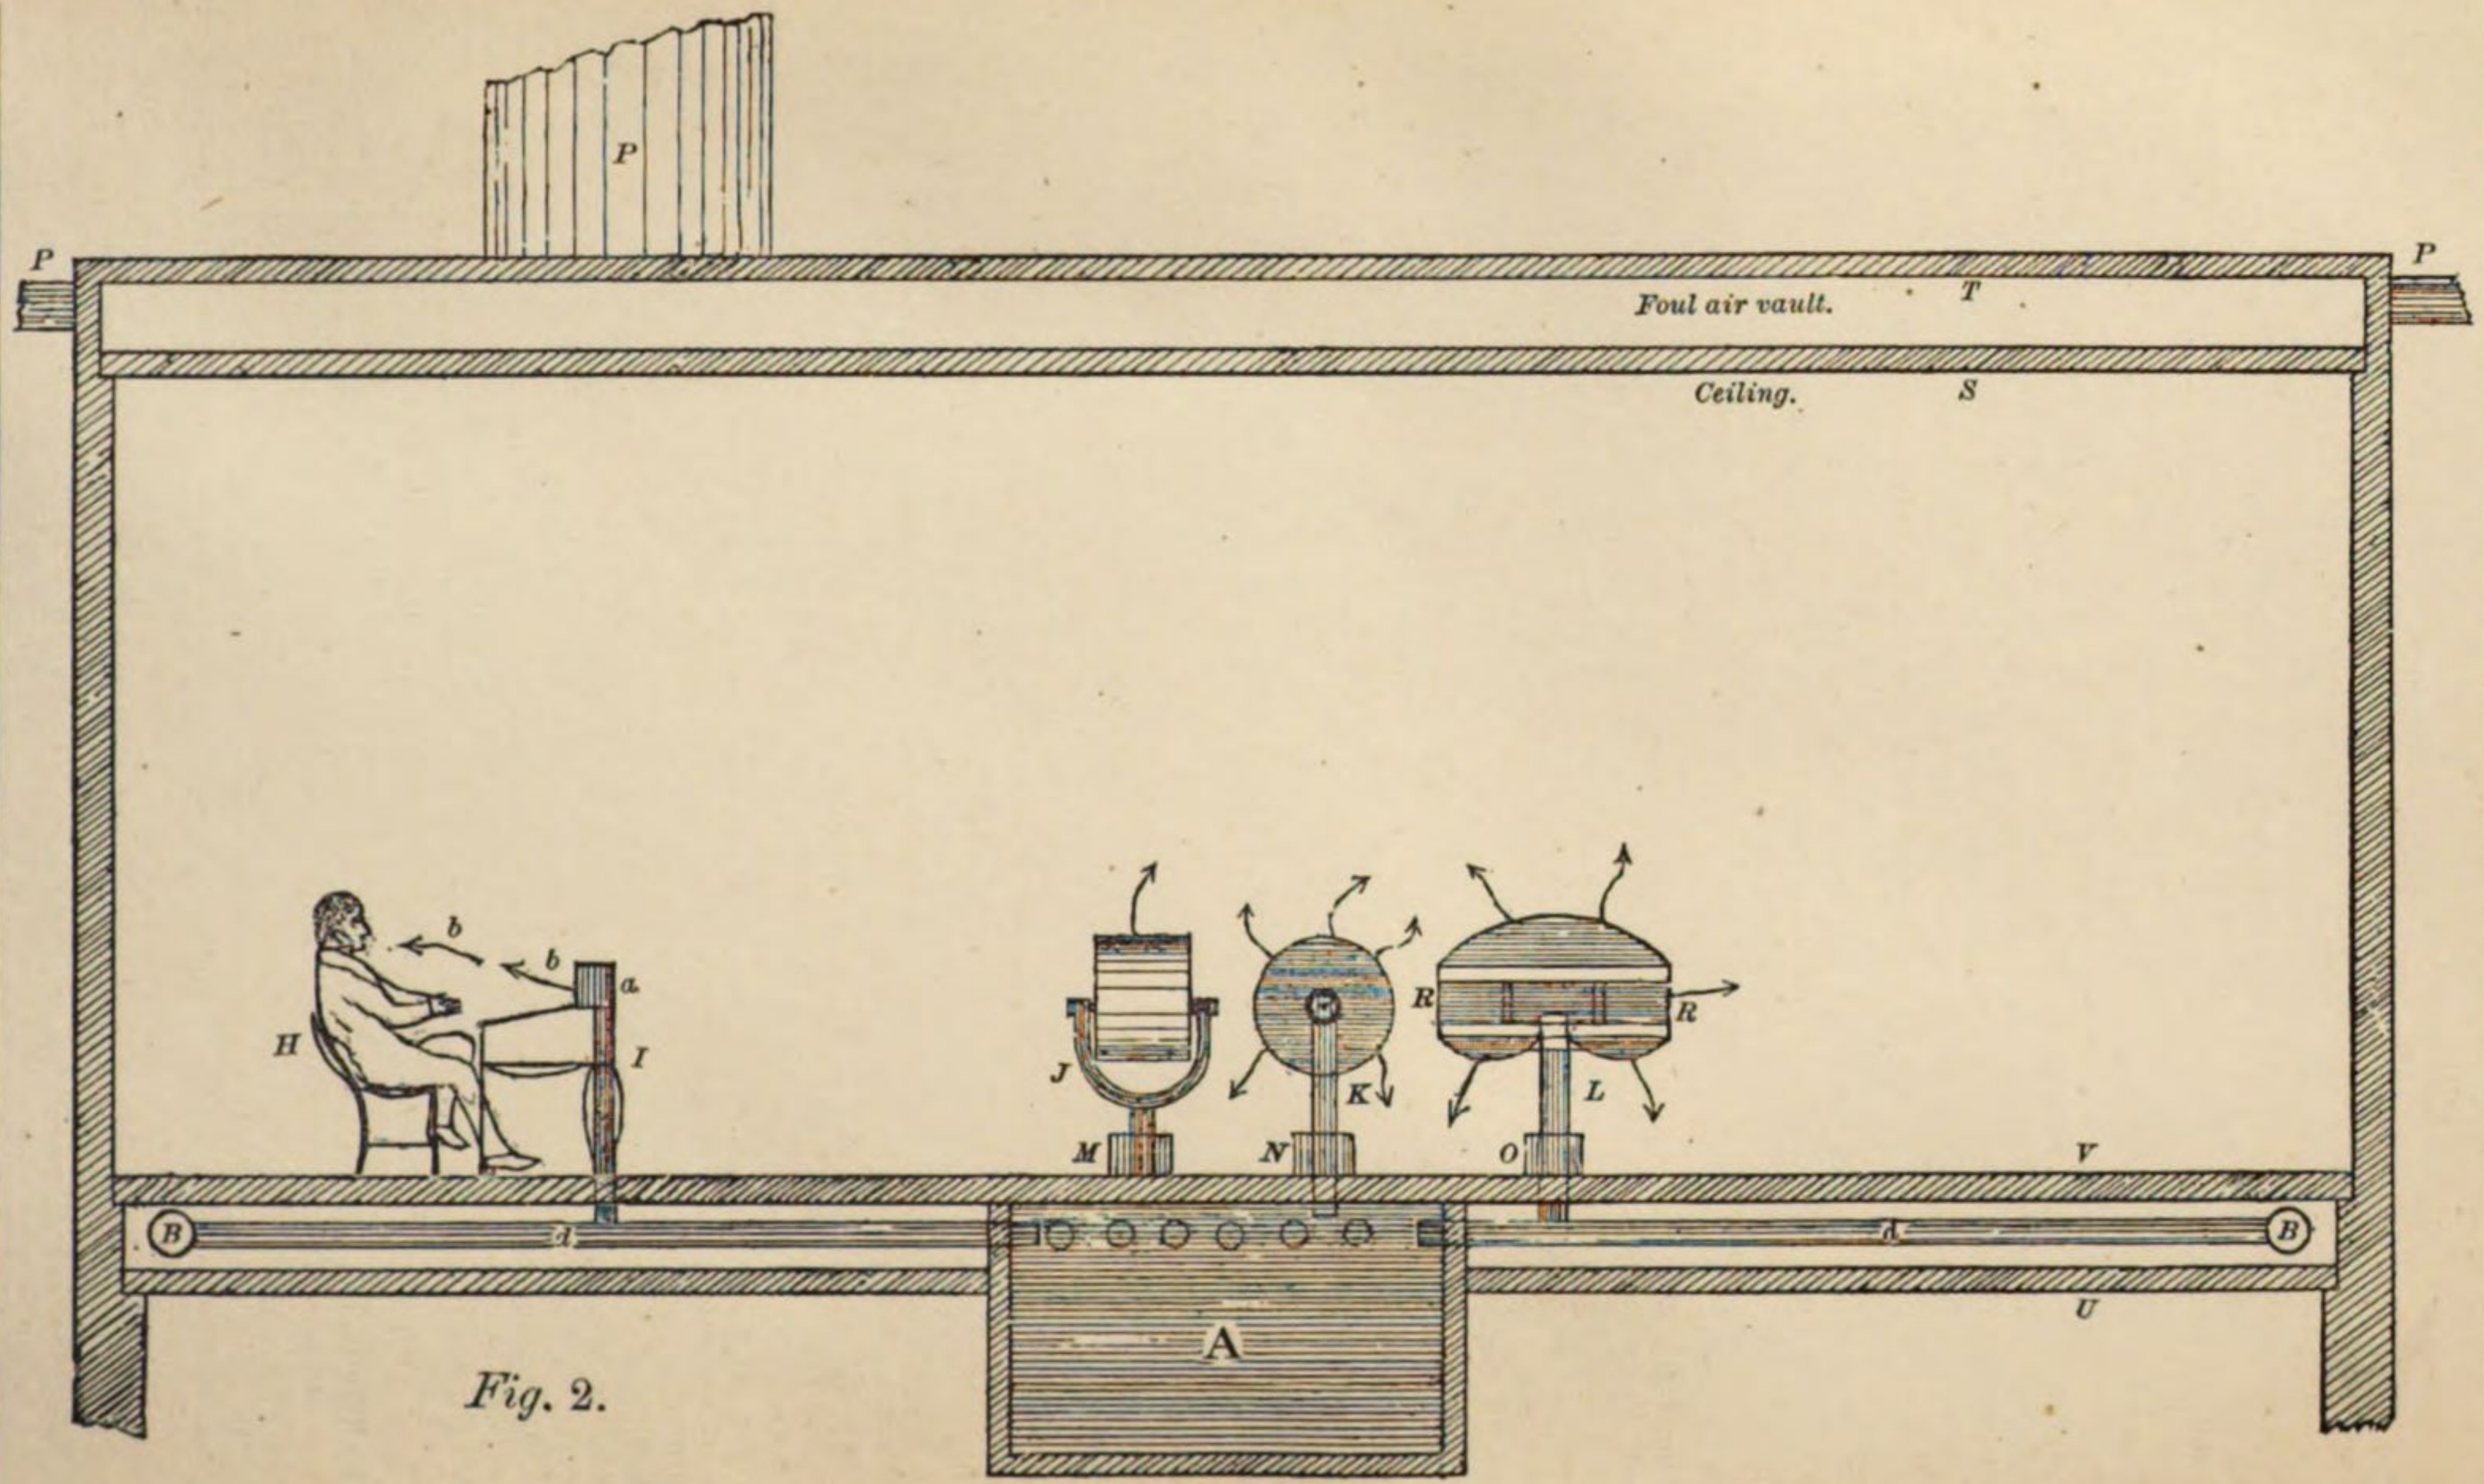


Fig. 2.

B.

A specification for a plan by William Loughridge, of Baltimore, Maryland, for ventilating the hall of the House of Representatives.

Fig. 1 shows the floor of the hall, with the honorable Speaker's chair omitted. Fig. 2 is a side elevation, showing one honorable member of the House seated at his desk. This figure may be considered as a representation of each member in his respective place, excepting that it is not on a true (too large) proportionate scale. A represents an air-well between the two floors, U V, (see side view,) immediately in front of and under the Speaker's chair. This well would be better if carried to a depth of 20 or 30 feet, so that a large body of air may be accumulated within it; and also for the purpose of attempering the air by heat or cold to any desired degree Fahrenheit. B B and F F are four main arteries, or feeding-pipes, that convey the air from the fans or force-pumps into the air-well A. C is also a large secondary feeding-pipe, that is connected (Siamesed) with F at *e*. G G are two branch pipes that connect with C, and may run into and out from registers in any part of the hall. Any of the other pipes may also run into and out from registers, so as to afford the same, or more, register surface than is now constructed within the hall. The one end of the pipes pass through the shell of the air-well A; thence through the aisles, with the other ends, into the semi-circular pipe C, affording a free circulation and communication of air from the fan to the well, or from the well to all the conduits or pipes belonging to the whole system. Y represents small air-pipes, that connect at each end with the pipes *d* under each tier or semi-circle of desks. These small arteries complete the whole system, and I aim to induce a free circulation of air through all parts of the pipes, with a pressure or tendency of the air to escape into the hall with equal force and in equal quantities at each desk. If, however, owing to the friction of the air, or other causes, the escape into the hall should not be equal to the quantities desired at each point, then by regulating the size of the escape apertures the desired quantities may be obtained.

One of the sockets M N O is intended to be screwed into the pipes Y at each desk, and all other points where air is to be admitted into the hall. These sockets may be cut off flush with the floor, recessed below the surface, or as they now show in the drawing. Within these sockets valves may be constructed, ground air-tight, to bear upwardly against the lower ends of the sockets, and held there by springs until pressed open, as hereafter set forth. I represents one of the desks with an air-chamber *a*. I propose making one or more of the legs of each desk, seat, or lounge hollow, so that the air can pass from the supply chamber into any air-chamber that may be constructed upon, within, under, or about the desk. I also lengthen the hollow legs of each desk, which may be set into the socket M and C, so that the valves in the socket M will be forced open, and the air have free circulation from the air-well to the reservoirs in the desks, &c. The angle of the reservoir *a* may be so adjusted that the air will flow in direct lines from the reservoir to the respiratory organs of each member, as shown by the arrows *b b*, or in any other direction at will. I also propose regulating the inflow of air at each desk, or other points, by cocks or valves, to meet the wishes of each member.

"In man the respirations are generally thirty-five per minute in the first year of life, twenty-five during the second, twenty at puberty, and eighteen in the adult age;" therefore different persons, at different periods, require different quantities.

The figures J, K, and L show different ways of securing a large area of canvas, silk, or other material, which can be thrown over registers to allow the air to permeate into the room at a low velocity. With these canvas registers put over apertures on the backs of the seats, in different parts of the desks, or furniture of the hall or galleries, will afford plenty of pure air without the least perceptible draft, as the surface can be made ample for the lowest velocity of air. I propose cutting apertures in the ceiling, so that the foul air shall pass into the foul-air vault T; and from this vault I extend pipe or pipes P to some desirable point of exit, as set forth in paper A.

Having in an imperfect manner set forth the leading points of my mode of ventilating the hall of the House of Representatives, I may send some other papers more explanatory of the whole plan. I shall not annoy you, however, with persistent and prolonged effort to induce its adoption; but will be pleased at all times to make further explanations, and, with the assistance of your able architect, make any experiments on a small scale to demonstrate the truth of the whole. With this plan the profile of the floor can be maintained as it is at present, and there will be but slight alteration required at any point. Of course all the pipes shown in the ground-plan will be covered, and if the legs of the desks are availed of to convey and distribute the air around each member, the change will hardly be perceptible; but that the result will be as near perfect, or lead to perfection, I have not a single doubt.

I present this plan to your honorable committee and to the honorable Congress of the United States with a hope that I shall have your coöperation.

Very respectfully, yours,

WM. LOUGHRIDGE.

SUGGESTIONS OF ROBERT BOYD.

EVANSVILLE, *January* 2, 1871.

DEAR SIR: By this day's mail I forward you some pamphlets on an economical system of ventilation, on which I received a patent in November, 1867, and have used it with very satisfactory results. Being anxious to bring it into more general use, I recently visited New York and Massachusetts, (from whence I have just returned,) and exhibited my model to several scientific gentlemen, architects, builders, and others of high reputation, and it received their hearty and universal approbation. Having met with this encouragement, I have been induced to present it still further, and through the kindness of my esteemed friend Hon. John C. Shoemaker, (whose letter please find inclosed,) I take the liberty, most respectfully, to ask you to do me the favor to bring my system of ventilation to the attention of the congressional committee on that subject. I could furnish you many testimonials in favor of this system and its construction; but I prefer to present it on its own merits, believing the gentlemen that are on that committee to be fully capable of judging its merits, and deciding whether it is worthy of their approval and recommendation or not.

For a moderate sized room, one of these ventilators is sufficient; for large rooms, as many may be used as will be necessary for thorough ventilation. I make a slight difference in their construction for hospitals from those used in other places, but no difference in the plan or system. Simplicity, economy, and utility are its chief points.

If the honorable committee should give it a favorable consideration, and require any further explanations in regard to it, I will be glad and happy to respond to their call at any time.

I am, very respectfully, yours, &c.,

ROBERT BOYD.

Hon. WM. E. NIBLACK, *Washington City.*

The inclosed letter of Robert Boyd, esq., with accompanying pamphlet on ventilation, is respectfully referred to Hon. Thomas A. Jenckes, chairman of the Committee on Ventilation of the House of Representatives.

W. E. NIBLACK.

WASHINGTON, D. C., *January* 9, 1871.

(This proposition refers to a pamphlet containing a description of an apparatus patented by Mr. Boyd, but there was no proposition to adapt it to either hall. As any attempt to use it would require considerable alterations and a new and expensive apparatus, the committee did not prosecute their inquiries in this direction any further.)

MEMORIAL OF A. J. MARSHALL, ON THE VENTILATION OF THE TWO HALLS OF CONGRESS.

To the Senate and House of Representatives of the United States:

The memorial of A. J. Marshall, a citizen of the State of Virginia, respectfully represents, that he has for many years made the art and science of ventilation the subject of his earnest thought and most labored investigation; and he confidently affirms that he has invented improvements upon existing plans or systems, as practiced here and in Europe, which will advance the art of ventilation to a stage of excellence not heretofore attained.

Your memorialist claims, in an especial manner, to have studied the character and philosophy of the system on which the two halls of Congress have been ventilated. He has no criticism of his own to offer, but will refer to the luminous and comprehensive reports of joint committees of Congress, made within a few months past, on the ventilation of the Capitol. In those reports will be found an able exposition of the deficiencies and inherent vices of the ventilation now given your legislative halls.

From these elaborate reports the mortifying fact is gathered, that a system of ventilation has been imposed upon the two Houses of Congress, from the errors and vices of which the legislative halls of Great Britain and France, after costly struggles between opposing systems, continued through a score of years, have just been emancipated. Thus it appears that a hurtful and erroneous system of ventilation, a system exploded and abandoned because of its wrong philosophy and practical inefficiency by the most enlightened nations of Europe, has been adopted here, and in face of this warning experience has been foisted upon the two halls of Congress.

Nor is the adoption of the discarded systems of the Old World the only blunder bearing on a good ventilation which these able committees have exposed and disclosed for correction and amendment. Their reports demonstrate that the evils of this exploded system of ventilation have been greatly aggravated and multiplied by the ex-

periment of lighting these spacious halls through an immense glass dome placed in the roof, and expansive glass ceilings placed over each, thereby subjecting the halls to the influence of a direct solar action upon and through this vast area of exposed surface.

The conclusion to which these committees come, after most thorough and searching scrutiny, is that the two halls of Congress can never be properly ventilated, unless the structure of the halls is altered in conformity with the original plans of the architect, and unless the present obsolete plan of ventilation now in use at the Capitol shall be abandoned, and the modern ventilation, sanctioned by the experience of England and France, shall be substituted therefor.

In this judgment of your committee the memorialist entirely concurs; but he must be permitted to state that this modern plan of ventilation, although a great improvement upon the ventilation now furnished in your halls, is itself, in some important respects, defective and inefficient. It is therefore matter of gravest interest that remedies for these imperfections shall be discovered and applied.

Your memorialist claims to have discovered such remedies, and by a new arrangement and combination, and by novel and simple devices, he claims to have invented a new plan or method that will improve and perfect the proposed ventilation, and secure within the halls of Congress a pleasant and wholesome ventilation, adapted to all the changes of our variable climate.

Your memorialist, in anticipation of the action of Congress on this interesting subject, had prepared papers explanatory of his invention, which he had designed to submit to a committee, if one should be appointed. He begs leave to incorporate these papers (as Appendix A and B) to be taken as part of this memorial. They disclose, as far as it is proper to be explained in a memorial, the nature and principles of the invention.

Your memorialist respectfully asks that his petition may be referred to a committee, with instructions to investigate the subject, and report what action in the premises will best subserve the public interest.

Your memorialist will ever pray, &c.

A. J. MARSHALL,
Warrenton, Virginia.

APPENDIX A.

To the Honorable Chairman, &c.:

GENTLEMEN: I ask your attention to a subject of grave importance, to wit: the wholesome ventilation of your legislative halls. It is conceded on all hands that the existing plan of warming and ventilating these halls has proved to be an utter failure, from the evils of which our national legislature must be rescued.

A careful study of the vices and inefficiencies of this ventilation at the Capitol, and, indeed, of all the plans or systems of ventilation hitherto practiced upon, in Europe as well as in the United States, has suggested to my mind remedial devices, that will improve and largely advance the science of ventilation, and relieve it from this opprobrium of inefficiency.

These devices constitute a "new method" of ventilation, which I have recently caveated, and to which I now ask your attention. As applications for foreign patents are yet depending, it is inexpedient to make full explanations of the peculiar devices of this new method, except to the committee in the confidence of consultation. I propose, however, in this paper to foreshadow some of the leading and novel results of the new system.

First. The air for ventilation will be drawn from a point of great altitude—a point high above the region of the local miasmas of the city or of the Potomac, and beyond the range of the warmth that radiates from the earth's surface. Thus will be secured for respiration in the halls an atmosphere of absolute purity, which will also, in summer heat, be very much cooler than will be the lower strata of air.

Second. This pure air will be attempered and prepared for the halls by simple devices, and in a manner more manageable and convenient than at present. It will then be sifted in at the ceiling, in accordance with the original design of the Architect of the Capitol Extension, and in conformity with the received systems of ventilation now prevalent in Europe.

Third. By a novel device of marvelous simplicity this ventilating air will be forcibly detained and accumulated within the halls until it has attained a compression or condensation therein of, say, five or ten pounds the square foot, (not the square inch!) or of any degree of pressure that experiment may prove to be best and most sanatory. At such point of condensation the condensing device will yield to the pressure, and the foul air will be forced to escape through the then open registers on the floors of the halls and the risers of the galleries.

It is to the greater purity of the ventilating air, and in this novel feature of meas-

ured condensation in the halls, that the greater excellence of the new method of ventilation may be mainly attributed. The great benefits of a pure air in ventilation will need no illustration; but the admirable results achieved by this novel feature of condensation are not so apparent, and therefore I propose to make a succinct enumeration.

The first result of a measured and regulated compression of air within the halls will be very much to improve their acoustic capacities. The voice of the speaker, in its every intonation, without increased strain on his lungs, will be heard at every point of the halls and galleries; for it is a well-established truth that the more dense the medium, the more perfect always will be the transmission of sound. In addition to this effect, it is verified by eminent physiologists and physicians that condensed air has a tendency to brace the nerves, improve the digestion, and in a measure to energize the mental functions.

A few years since, the cheering and bracing effects of condensation upon the human system formed the subject of a series of interesting physiological experiments made by a Mr. James, who thus writes:

"When a person is placed in condensed air, he breathes with a new facility. He feels as if the capacity of his lungs was enlarged. His respirations become deeper and less frequent. He experiences in a short time an agreeable glow in his chest, as if the pulmonary cells were becoming dilated with an elastic spirit, while the whole frame receives at each inspiration fresh vital impulsion. The faculties of the brain get excited; the imagination becomes vivid; and the ideas flow with delightful facility. Digestion is made more active, as after gentle exercise in the open air, because the secretory organs participate immediately in the increased energies of the arterial system, and therefore there is no thirst."

It is not designed, however, to press this condensation to the extent of these experiments of Mr. James; hence I have used the expression that condensation will have "a tendency to brace the nerves and energize the system." The device that bestows upon the science of ventilation this new and valuable faculty, as has been said, will give any measure of condensation, large or small, that may be found sanatory and pleasant.

A third and an elementary change, also consequent upon this condensation, arises from the manner of its action on the mass of resident air found in the halls when ventilation commences. Under all existing systems of ventilation, this resident air is found to be an obstruction to an equable temperature and hydration throughout the halls. The new air, attempered and moistened, is at present forced in upon this great body of resident air in the halls, and although of a different temperature, the two are expected to commingle in one homogeneous mass of a uniform temperature and moisture. Thus, under present systems, the halls are made to serve as grand laboratories or mixing rooms for unequal temperatures. We find, as resulting from these unreasonable violations of atmospheric laws, that unequal temperatures and currents will prevail all over the halls.

The effect of the proposed condensation will be to remedy these objectionable results of existing systems of ventilation. Under the new method of ventilation, in cold weather, when the new air enters the hall or room, being lighter than the cool resident air, it floats near the ceiling and forms in horizontal strata, which, by constant accretions from the fan, accumulate and wedge downward upon the resident air of the hall, until the pressure has so multiplied as to force open the obstructing device and give free exit to the foul air. Then, (when the obstructing device has yielded,) as strata of new air are driven in at top of the hall, equal strata of old resident air escapes at the floor, until all the resident air has been expelled, leaving the entire air of the halls one homogeneous mass.

A fourth result to spring from condensation is to be found in its uniform and assured expulsion of all offensive air and gases that always will attend a crowded house and galleries. The movement of the air will be from the ceiling to the floor, not in streams or currents, but in a steady downward progress, of such force, however, as to deflect the breath and warm emanations from the persons of the crowd down toward the floor, thereby always presenting an untainted air for respiration.

A fifth resultant of the "new method" will be found in its large economy, it ventilating the halls with one-fourth of the volume of air now required. At present 50,000 cubic feet of air is forced into the hall of Representatives alone. All control and direction of this air is abandoned as soon as it enters the hall. It is then left to its own vagaries to get out as best it may, through chimneys, doors, or the registers on the floors. Experience has shown that very little escapes at the floor, and that foul air will accumulate on the floors and in the galleries.

On the other hand, under the "new method," a perfect command and direction of the air within the hall is maintained all the time, down to its final expulsion. The enormous waste of the present system is saved in the well-ordered appointments of the "new method." One-fifth of the air now required will give a better ventilation to the halls, and consequently four-fifths of the cost of warming and moistening the air for ventilation will be saved.

A sixth result to flow from this novel device for condensing the air in the uses of ventilation is that it will render the ventilation of the entire Capitol and of every room and space within its walls matter of easy and convenient accomplishment. Not only can the halls, the court-rooms, library and committee rooms be pleasantly warmed and ventilated, but the damp and dark vaults in the basement, now useless and mere generators of unwholesome vapors, may be made dry, and being thoroughly ventilated will become safe and valued depositories of the public archives. These benefits may also be extended to all the departmental buildings, and to the presidential mansion, if its adoption in the Capitol is successful. Already have the accumulations of Government documents overcrowded the rooms of these buildings. The demand for increased accommodations will compel the expenditure of millions for new structures; but the spaces in these buildings acquired and utilized by introduction of this improved ventilation will postpone to a distant day the necessity of such expenditure.

One other sequence of this improved ventilation and I have done. It will be found that the condensation of air within the rooms of a building will effectually protect the records and folded papers from the intrusion of the gritty dust which now eddies in upon them from the street. The compression of air within the rooms will cause an outflow through every crack and crevice and opening that will resist and repel the entrance of outside winds.

I have given these general effects or results of the "new method" without explanation of details. I will only add that "the new method" has been submitted to the criticism of the first and most eminent science of the country, (members of the Coast Survey and others,) and it has been approved by their judgments. I must now conclude by a brief reference to some alterations in the structure of the two halls of Congress, which the blundering errors of those who superintended the building of the Capitol extensions have made necessary. The wretched ventilation now inflicted on the two houses of Congress is traceable to these errors, which are the more intolerable because they were imposed on the public in violation of the elaborate and enlightened plans furnished for their guidance by that eminent engineer and architect, Charles F. Anderson.

The designs for the two halls as originally devised by Mr. Anderson would have given to the nation halls of the most perfect architectural model in the world. Anderson, who was a thorough architect, and had matured his professional taste and skill by extensive observation and study of the best models in Europe, furnished the plans and drawings for the Capitol extension. Before his plans were adopted, they had been submitted to the scrutiny of the President of the United States, to the heads of departments, committees of Congress, and to boards of learned men, such as Professors Bache, Henry, and others, for their well-considered opinions. After long and anxious examination, these eminent officials and learned savans approved the designs and authorized the work to be executed in accordance.

By what authority the superintendent of the Capitol extension departed from these designs of Mr. Anderson I have not seen; but it is certain that in execution of the work the architectural symmetry of the halls, as Anderson had planned them, was ruthlessly violated, and that all his well-studied principles of acoustics and of wholesome ventilation were subverted and reversed.

By Anderson's plan, the larger hall was to have been of about 52 feet in height; the superintendent gave it about 36 feet. Anderson designed to admit the light into the hall through side windows placed overhead, as are the windows of the rotunda, and to place the present glass ceiling above these side windows, thereby giving to the hall a lofty and magnificent appearance, and affording a light that could always be regulated by blinds and shades. The superintendent has dwarfed these lofty and beautiful proportions, and has given to the hall a flat and squat appearance, repulsive alike to good looks and a chaste architecture.

These outrages upon the admirable designs of Mr. Anderson were not, however, confined to violations of good taste and architectural appearance; with a ruthless hand the superintendent disregarded and reversed the well-studied plans of Mr. Anderson for the admission both of light and air into the halls. As just said, he dwarfed their height by 16 or 17 feet, thereby dispensing with side windows, in lieu of which he admitted light into the halls through spacious glass domes with skylights in the roof.

The glass skylights over the Senate chamber have an area of more than 3,400 square feet, and those over Congress hall present a surface measure of about 5,000 square feet. Thus, in reckless subversion of Anderson's elaborated plans, the Representatives of the people are now exposed uncovered to the terrible gaze of our summer's sun.

A second and a radical departure from the well-considered plans of Mr. Anderson, and not less deleterious in its effects, was in the reversal of his mode of admitting the ventilating air into the two halls of Congress. Anderson directed the air to be driven in at the ceiling, and to be forced downwards through the halls, and expelled through the floors. This was in accordance with the systems now in use in England and other European governments. The superintendent, however, in reversal of this system, and in face of the present approved practice, went back to the old discarded system, and

forces the air in at the floors, to be driven out at the ceilings. It is deemed to be of absolute necessity to any wholesome plan of ventilation that these elementary defects of structure shall be amended. If the halls be not protected from the solar influences of those spacious skylights, there can be no system of ventilation that will render the halls endurable in summer's heat; and the effects of this vast glass surface in the winter are also injurious to good ventilation and equable temperatures. I content myself, however, by a simple reference to the lucid and concise report of Senator Buckalew, as chairman of a joint committee on ventilation, ordered to be printed July 18, 1866.

I will suggest that the old hall of Representatives be fitted up for occupation of the Senate until the necessary alterations of the Senate chamber can be made. The lower House can then in like manner vacate their hall for the same purpose.

APPENDIX B.

To the honorable chairman, &c.:

GENTLEMEN: There are points and features of the new method of ventilation I advocate for your adoption in the two halls of Congress that require to be examined and discussed before it can be expected you will give the plan a thorough approval. There always will be doubts and misgivings as to new and untried theories in their first practical operations, and hence I desire to meet and answer before you certain difficulties of the plan which have embarrassed my own mind in reasoning to my present judgment.

The first point of solicitude in all plans of ventilation is to secure an abounding volume of pure, untainted air for breathing purposes. The new method, however, presents conditions and movements of the ventilating air unknown to all existing systems, and therefore former methods will furnish us no means of judging what volume or velocity of air is best in establishing good ventilation under the new plan.

Under the devices of the new system an absolute empire over the ventilating air is claimed and acquired. Its volume or quantity, its velocity of movement, its course or direction, may all be appointed and accurately defined. In a word, we must learn to know that the air can be made to yield to the coercion of the fan the same implicit obedience and ductility that gas does to its gasometer.

As a consequence of this high command and implicit obedience of the ventilating air, any measure or volume that is needed may be driven in at the ceiling of the hall, and, being denied all egress except at the floor, its course or direction is necessarily downward. Being in cold weather of a warmer temperature than the resident air, it will spread in the top of the hall in layers or strata, and from the continuous accretions at the ceiling these strata of new air, in swollen force, will continue to wedge downward in the hall, and impacting the lower air upon the floor, will reach a condensation in the hall that will force open the obstructing device placed in the main foul-air tube, and thus open for the air a free passage "out of doors."

Such is the mode of action under the new method, from which it is evident, as just said, that complete command of the ventilating air, in its volume or quantity, its speed or velocity, and in its course or direction, can be achieved.

With such supreme power in our hands we have to consider how it shall be used so as to effect the best ventilation in the halls of Congress. I intend, by best, that ventilation most wholesome and pleasant, and which, at the same time, will most improve the acoustics.

It is in this novelty of the proposed condensation or compression of the air in the hall that the most beneficial results of the new method of ventilation are to be found. The improvement of acoustics, the evenness of temperature, and of hydration over all parts of the hall, and the great economy in the volume of the air needed for ventilation, are resultants of this compression, which innovates on all existing systems. It is all-important, therefore, that all doubts shall be removed as to the ready practicability of achieving a compression of air within the halls to any exact pressure that experiment may show to be proper. I will now, therefore, address my explanations to this point.

First, then, what is the volume or quantity of new air to be forced into the hall that will suffice to produce a pressure of eight pounds to the square foot?—that being the pressure supposed to be proper for the purposes of the best ventilation.

There is one starting point or basis-fact from which a solution of this inquiry may be reached. The weight of the atmosphere we know to be fifteen pounds on every square inch, or 2,160 pounds to the square foot. Thence we derive the fact that two atmospheres forced into one and the same space will cause a pressure of 2,160 pounds to the square foot within such space.

From this fact, as a starting point, the measure of air required to cause a condensation of eight pounds to the square foot, within the House or Senate chamber, may be accurately computed.

The dimensions of the Representatives hall are 139 feet by 93 in width, and 36 in height; those of the Senate chamber are 113 in length and 80 in width, by 36 depth. This gives 475,372 cubic feet as the solid measure of one hall, and 325,440 as the solid measure of the other hall. We will say, in round numbers, that there are 500,000 cubic feet of air in the House, and 350,000 in the Senate chamber. The inquiry then will be to know how many cubic feet of new air, forced in upon these halls, (supposing them both to be air-tight,) will cause their condensation to eight pounds the square foot.

Now, it is very clear that 500,000 cubic feet of air forced into the hall of Representatives, in addition to the 500,000 already there, would bring two atmospheres within one and the same space, and would cause the pressure of 2,160 pounds to the foot within the hall. Then, by the rules of proportion, 500 cubic feet thrown into the larger hall would produce two pounds to the foot, (discarding fractions,) and eight pounds would require four times as much, or 2,000 cubic feet for the larger hall. A similar calculation will show that 1,400 cubic feet of air forced into the Senate chamber will give the desired pressure of eight pounds *there*.

These low figures, however, it must be observed, are not practically true, because it is not true that the halls are air-tight. Many doors leading to the halls will invite the escape of the condensation, besides other casual openings that will disturb the appointed downflow of the air. These are the practical troubles in the way of condensation, which I desire to examine closely with a view to measure their exact weight, and to show that they oppose *apparent* and *specious* difficulty rather than *real* obstruction to the practical accomplishment of this condensation, which I consider is the most essential feature of the "*new method*."

Every precaution will, of course, be adopted to forbid the escape of the air from the halls, except through the exits provided on the floors. The chimneys will be sealed up, the windows will be weather-stripped, and the doors of the hall will be doubled as in winter—so that, when opened for the entrance or departure of persons, only as much air will escape from the halls as will cause an equilibrium of pressure in the space between the doors and the air of the halls. Suppose this space between the doors to be a room measuring 1,000 cubic feet. Calculation will show that four cubic feet of air escaping into it from the hall will condense this space equally with the air of the hall! Thus we see the precise measure of the wastage from the opening of a door. Suppose there are 50 doors entering the hall of Congress and its gallery, and that each door is opened once a minute, the wastage from doors would only be 200 cubic feet per minute even then. [I have since ascertained that there are only 40 doors.]

If we suppose that the wastage from the hall from all other sources combined is equal to this wastage from the doors, the sum total of the wastage will only be 400 cubic feet of air per minute. This surely does not form an insurmountable difficulty. An additional 400 cubic feet, thrown in by the fan, gives the full compensation for this wastage. If, therefore, the fan be worked up to 2,400 cubic feet the minute, instead of 2,000, the trouble is done with. But we shall see that I contemplate furnishing 8,000 cubic feet of air per minute to meet other purposes of the plan; so that all doubts must yield on the practicability of keeping up the condensation.

The next point of difficulty to which I invite discussion is to the quantity or measure of the air per minute needed in the hall, for wholesome ventilation. Will 2,400 cubic feet of fresh air a minute suffice; and, if not, what quantity or volume per minute will be ample supply? By the present plan it will be remembered that 50,000 cubic feet of air per minute are thrown into the House to ventilate it. The idea of reducing this vast supply to 2,400 feet a minute is, I must admit, suggestive somewhat of a smothering sensation. Let us, however, examine this branch of the subject in a spirit of calm reason and judgment.

As remarked in the beginning of this paper, this new method of ventilation presents conditions and movements of the ventilating air unknown to all existing systems. These movements are novel, anomalous, *sui generis*. By all existing plans the ventilating air is abandoned to its own course from the moment it reaches the hall. All control and direction of it is *then* lost. It is *there* left to relieve its own accumulations, through doors or windows or chimney, and, if it will vouchsafe so to do, it *can* pass out at the exits on the floors, and carry with it the foul air collected *there*.

But experience has taught that this air has a nature of its own to consult; and, unless it be coerced in some way, it will not voluntarily seek these small and remote foul-air holes for escape when larger and nearer openings offer it free passage. Consequently very little air now passes from the hall through the apertures on the floors.

The theory of the new method is in strong contrast. It asserts and maintains an empire over its ventilating air *all the time*, from the blade of the fan down to its final expulsion through the foul-air conduit into open space. From the forced entrance of this air into the hall, its every movement, its velocity, and its downward course in measured strata, are all prescribed, and by intelligent appointment. In cold weather, being of warmer temperature, and consequently lighter than the air it finds in the hall, it will float at the top and spread in horizontal strata, which by constant accretion from the ceiling will wedge downward, and will impact and drive the resident

air before it; having no outlets, save those on the floor, the whole body of the air will settle down in a measured and regulated order.

The theory of the new method, moreover, requires that the air in this downward movement shall have speed and force enough to carry with it to the floor the warm breath and the offensive emanations of the human bodies, and thus preserve untainted for inhalation the higher air. This is an eminently distinctive feature of the new method. The warm and foul emanations of the crowd cannot rise to corrupt and taint the respiratory air. Once exhaled, the same air is never again presented to be taken into the lungs.

From these causes, as has been said before, lights drawn from former systems of ventilation give no data for estimating the quantity or volume of air required under the new method. It must not be overlooked, however, that the new method possesses all the power to command the air in quantities that existing methods possess. The only question, then, I wish to discuss is, what is the least quantity of air that will give full and ample ventilation? If it requires 50,000 a minute, we have it at command; if 5,000 a minute be enough, there will be great convenience and economy in the discovery.

This brings up for consideration the subject of acoustics, which should ever be connected with ventilation; and as sound is known to be more perfectly transmitted the more dense the medium, the condensation proposed for the two halls must give the new method an eminent preference. But freedom from currents and all practicable stillness is also conducive to good hearing, and must be carefully cherished in the system to be adopted. It is desirable, therefore, to give the air of the hall in its downward movement only such speed as may suffice to deflect the warm breath of the crowd and carry it down to the foul-air exits on the floor.

It will not be time wasted to pause at this point and philosophize a little on the unwonted and abnormal purposes aimed at in this new method of ventilation. To drive the warm human breath dowward, and thus to reverse the course of a warmer and lighter air, outrages all our prejudices and shocks our personal belief. It is best, therefore, to subject the proposition to the test of a strict analysis, that no grudging credence may be given to this most important feature of the new method.

The impulsion of the human breath, when it first issues from the nostrils, is almost vertical towards the ground. When it issues from the mouth, by reason of the dental and labial structure, there is given to the breath a horizontal, or perhaps a slightly downward impulsion. These are facts visible to any one in frosty weather. It is also noticeable that the breath begins to rise when the force with which it leaves the mouth has abated. This we know is due to the warmth of the breath compared with that of the air, the warmer being also the lighter. For the same reason the air in immediate contact with the human body assimilates with its temperature and rises, carrying upward the impure emanations of the skin. From these sources of taint the air in the higher parts of a crowded room becomes offensive, and if breathed over again would be unwholesome.

Now if the movement of this exhaled air be traced, (and it may readily be seen in cold weather,) it will be found to be very gentle. It rises slowly, and is deflected in any direction by the slightest currents. The smoke puffed from a pipe or cigar well illustrates the gentleness of the movement, and the ready ductility of the warm breath.

It may be seen to stream downward even from the slightest current of the draught of the chimney. From these illustrations it is clear that a very slight movement of the air in the hall, in the direction of the floor, will carry with it the expired breath of the crowd, and also the offensive emanations. Whatever, therefore, be the tendency of the breath upward, if met by a downward movement of the air stronger than such tendency, the breath must deflect and be carried downward, leaving the higher air pure and untainted.

I am satisfied that a current of four inches per minute will suffice to conduct these impurities of the crowd to the floor, and it remains to show what volume of air per minute forced in at the ceiling will cause a down movement of air in the hall having a speed of four inches the minute. On this point I will submit the following estimates:

The area of the hall of Representatives at the ceiling (including the galleries) is $139 \times 93 = 12{,}900$ square feet. One foot in depth of this area will measure 12,900 cubic feet, and if 12,900 cubic feet of air per minute be forced in at the ceiling, it is obvious that the same measure will be wedged out at the floor, (there being no other outlet,) and that thus a downward movement of 12 inches a minute will be effected in the whole body of the air in the hall. If, therefore, the fan shall be worked to drive 12,900 feet the minute into the hall, the downward flow of the air will be at the speed of 12 inches the minute, which is three times the velocity called for. I am, therefore, warranted in the conclusion that for the purpose of carrying downward the breath and other impurities of the crowd, and of protecting the overhead air from all such offensive taint, 4,000 cubic feet of fresh air per minute will be found an ample supply.

The last point I wish to discuss in this paper is, whether the 4,000 cubic feet per min-

ute will suffice to supply the crowd on the floor and in the galleries with breathing air and an abundant ventilation. In considering this part of the subject, we must hold in view all the conditions and movements of the air induced by the action of the new method. We must remember that it is guarded against all taint or corruption of the higher air, as it will be continuously presented for inhalation; it has forced downward the breath and the warm emanations of the skin, and in fine it only leaves for calculation the quantity or bulk of air required for the actual inhalation of the crowd. On this point I present the following estimates:

The House is overcrowded when there are 1,000 persons in the galleries and 500 on the floor. The Senate never contains this number. All the books tell us that a healthy man draws into his lungs 25 cubic inches of air at a breath, and that he inhales 20 times a minute. There are 1,720 cubic inches in one cubic foot; so that the man actually only needs for inhalation one cubic foot of air every nine minutes. This shows that 500 cubic feet of air a minute will measure all the air actually taken into their lungs. This, therefore, is all that is required for breath, as it is the full capacity of their lungs. But a greater volume than this, however, will not be wasted; for being constrained downward to the exits on the floor, it will remove in its descent the air next the body, which has been warmed by that contact to the temperature of 98°, and will substitute its own temperature of 68°, thereby greatly refreshing and invigorating the whole system.

I have thus shown that 500 cubic feet of air is enough for inhalation; 2,000 cubic feet for the condensation; and 4,000 per minute will suffice to produce the down movement of the air at four inches the minute. But to insure all these objects, let us force in upon the hall 8,000 feet the minute, if it be found on trial not to injure the hearing within the hall.

I have presented these views to show how unreal are the apparent difficulties which oppose the adoption of the "new method" of ventilation. I need say nothing of its great economy in requiring the use of about 5,000 instead of the 50,000 cubic feet now demanded by the present system.

IMPROVEMENT OF THE HALLS OF CONGRESS.

February 20, 1865, Mr. Buckalew submitted the following report:

The Joint Select Committee of the two houses of Congress appointed at the last session to examine into the present condition of the Senate chamber and hall of the House of Representatives, as regards lighting, heating, and ventilation, and their acoustic properties, and the defects and disadvantages existing in the same, make the following report:

That pursuant to the resolution of appointment they have obtained from Charles F. Anderson, architect, a statement of the principles upon which he proposes the improvement of the halls of Congress, as regards the particulars above mentioned, and also estimates of the expense that will attend the proposed alterations, and they append the said statement and estimates to this report. They have also obtained plans and drawings of the proposed changes of the halls and Capitol wings, as authorized by a clause of the miscellaneous appropriation act of 2d July, 1864, which are deposited with the secretary of the Senate for examination by the members of both houses. The committee have also taken the voluntary testimony of a number of witnesses upon the several subjects covered by the present inquiry, to enable them to come to intelligent conclusions, and they now beg leave to submit that testimony in connection with this report for the information of Congress.

The committee propose, in the first place, to examine the several defects alleged to exist in the present arrangements relating to the halls of Congress, and particularly those relating to their ventilation; next to state distinctly the character of the changes proposed; and, lastly, the time, manner, and cost of their accomplishment.

First, then, as to existing defects:

PLACE OF OBTAINING AIR.

1. The air for ventilating the halls is now taken from the levels of the terraces, between the wings and the old Capitol building, on the western side. To these situations much dust and other impurities are carried by the action of winds, subjected to the influence of eddies, and taken with the air through the ventilating passages into the halls. And in warm weather the terraces and adjoining walls, becoming heated, affect very considerably the temperature of the air obtained. Reference upon this point of the inquiry is made to the testimony of Dr. Antisell, and Mr. Forney, the engineer in charge of the ventilation of the House of Representatives. It is manifest that the air

introduced into the halls should be obtained from places not subject to the accumulation of impurities, or to the undue production of heat.

OVERHEATING THE AIR.

2. By the examination of the engineer in charge of the heating and ventilating department of the Senate chamber, it appears that the air, on its passage to the chamber, is heated exclusively by steam, introduced into mazes of pipes for the purpose. Hot water is not used, and it seems certain that the air is overheated, and thereby subjected to injurious changes. Professor Wyman says:

"In all cases in which it may be necessary to warm the fresh air required to be supplied to an inhabited room or cell, it is essential to health that the increased temperature should be derived from a moderately-heated surface; hence the advantage of using water as a medium of heating. In a hot-water apparatus of ordinary construction the temperature of the surfaces, when exposed to a current of air, will never reach the boiling point, and it is obvious that they may be regulated in any lower degree that is likely to be useful."

Among the conditions prescribed for the warming apparatus of Pentonville prison—the "model prison"—was the following:

"That the entire radiating surface should derive its temperature from the circulation of hot water, and that it should be of such an area as would maintain a temperature of 60° in the cells when the external atmosphere was at 32°; further, that under ordinary circumstances the temperature of the heating surface should not range above 100° to 120° of Fahrenheit."

This point of overheating the air demands amendment, which must be secured in any new arrangement regarding ventilation.

DEFICIENT MOISTURE.

3. But one of the most manifest and material defects in the ventilation of the Capitol wings is the exceeding aridity of the air supplied. To this point the committee have given particular attention, and the information obtained upon it is most conclusive in condemnation of the existing arrangement. Both health and comfort are disregarded in forcing into the halls air containing but one-third to one-half the moisture or vapor of water required at the temperature to which it is raised. It is to be taken for granted that the natural constitution of air at any given temperature is better adapted to life and human comfort than an artificial one can be, and it is to be secured as nearly as possible in all structures designed for human occupancy. In a free atmosphere the demand for moisture caused by increased temperature is fully supplied from natural sources. But in moving air through a confined space destitute of watery vapor, and subjecting it on its passage to the action of heat, while its character must undergo a change as to temperature and density, there will be no corresponding change in the amount or proportion of moisture it contains. In other words, moisture must be imparted to it by artificial means, if its true natural constitution is to be maintained. That a principle so well known and so indisputable should have been ignored in the ventilation of the Capitol is most surprising, and indicates, if it does not prove, incompetency or indifference to duty in the superintendency of the building.

Doctor Reid observes that "the moisture in the air is not to be regarded as an adventitious ingredient, but rather as an essential component of atmospheric air. It requires in general to be added to air in cold climates in winter in proportion to the temperature communicated to it before it approaches the person. If cold air be heated in spring and summer by natural causes, it absorbs a proportional share of moisture in general from the surface of moist ground, lakes, and rivers, or from the ocean, and thus reaches the system in a congenial condition. On the other hand, if cold and dry air be heated artificially without receiving moisture its increased power of absorbing moisture renders it offensive to the system."—*Reid on Ventilation, secs.* 341–43.

"The amount of evaporation into equal spaces is dependent upon the temperature, and increases considerably on a small increase of heat." Between 32° and 100° the amount of evaporation is doubled by the addition of about 20°, or at 52° it is double that of 32°. * * * In winter the air, when extremely cold, is proportionably free from moisture. The true time, accordingly, when moisture ought to be applied to air is not when it is warm in spring and summer, but as it is warmed artificially in winter. The temperature and moisture of the air are certainly the most important circumstances that demand attention after securing air of sufficient purity." (*Ib., secs.* 350, 436, 511.)

Professor Wyman says that "air holds in solution a variable amount of aqueous vapor, limited by the temperature. The influence of this agent upon the human system is exceedingly important. The lungs are continually exhaling moisture, its quantity depending upon the hygrometric state of the atmosphere. If the air be too dry, the lining membrane of the lungs, throat, and mouth may be deprived of necessary moisture so rapidly that an uncomfortable degree of dryness, or even inflammation

may be induced. Undoubtedly the best constitution of the air is that which nature affords. During the summer months the air has gradually increased in temperature, and appropriated from rivers and other sources that amount of vapor which is required. In our houses we should imitate the same course, and, heating air from below 32° to 70°, provide a sufficient supply of water." (*Wyman on Ventilatton*, pp. 190, 191, 196.)

"Air changed in temperature by warming without increased moisture is apt to produce unpleasant feelings and painful sensations in the chest, which are often attributed to too great heat. In very dry air the insensible perspiration will be increased, &c. The objection lies against *heated* air, no matter how heated. Stoves and air furnaces with their red-hot surfaces are undoubtedly worse for the air than hot water apparatus, which never scorch it, yet the latter may pour into our apartments a withering blast of air at 150°, which may be potent for mischief. The only way that hot air can be made healthful and desirable is by an effectual plan of artificial evaporation." (*Dr. Youmans's Handbook of Social Science*, 308.)

Appended to this report is a paper furnished the committee by Dr. John A. Rowland, showing the capacity of air for moisture at different temperatures, both as to volume and weight, to which reference is made for further information upon the present point. The figures are obtained from works of reputation, and they show that the air of the halls during the winter and spring requires two or three times the amount of moisture actually contained in it; for its aridity, caused by heating it, is modified in no way whatever, not even by leakage of doors and windows, as in the case of an ordinary apartment.

But what determines the condition of the air in this respect with perfect certainty is the examination given it by Dr. Wetherill, of the Smithsonian Institution. He examined the air of the Senate chamber on the 24th of January, and on February 9th, and states the results in his testimony. Indicating the saturation point of air at any given temperature by the number 100, we have a standard established for comparison, when ascertaining the quantity of moisture actually present in any specimen of air. Upon ascertaining the amount so present, it may be indicated by a number which will bear the same relation to 100 that the amount found present bears to the amount which would be present if the air were completely saturated or contained moisture to the full extent of its capacity. And in such case, the number indicating the quantity present is called the "relative humidity" of the air examined.

Now the mean annual relative humidity of atmospheric air in England has been ascertained to be about 75°, saturation being, as before stated, 100°. Mr. Roscoe states that in the House of Lords the air is pleasant to breathe when its relative humidity ranges between 55° and 82°. But Dr. Wetherill found the relative humidity of the air in our Senate chamber on January 24th to be as follows: In ladies' gallery, near reporters' gallery, at 2¼ p. m., 27. In same, near diplomatic gallery, 27. On same day, at 3 p. m., the relative humidity of the external air entering the ventilating fan, was 56.

On February 9th, with a relative humidity of external air at 55 at 2½ p. m., he obtained the following results in the Senate chamber: In southeast corner of chamber, on a level with desks, at 3½ p. m., relative humidity, 20; in diplomatic gallery, at 4 o'clock, 21.

These astonishing but indisputable results prove that upon that occasion less than one-third the proper amount of moisture was present in the air of the chamber.

An observation taken by him at 4.30 p. m. of the same day in the air-space above the ceiling is also instructive. He found the temperature to be 64°, while the temperature in the hall below at the previous observation had been 70.9° upon the floor, and 68° in the diplomatic gallery. An enormous influence of the roof in producing cold, and affecting the air of the halls, is shown by these figures. It was a cold day, with an external temperature of 30.6°.

It may be added that by observations taken at the Smithsonian Institution for the months of February and June, 1859, there being three observations daily, the mean relative humidity of the atmosphere for the former month was 71, and for the latter month, 69. Therefore, on the 9th of February, 1865, the air used in ventilating the Senate chamber, with an external February temperature, and an inside temperature of June, had a point of relative humidity in the chamber that required to be multiplied by 3½ to raise it to the proper Washington average.

With good reason, therefore, does Dr. Antisell declare in his testimony that one of the capital defects of our ventilation is the want of hydration of the air of the halls.

Some attempt has been made to hydrate the air recently, but in a very insufficient manner, and without material effect. The laudable effort of the present Sergeant-at-Arms of the Senate, with insufficient space and facilities at command, to hydrate the air of the Senate chamber, deserves commendation.

But to accomplish the object in view a radical change in existing general arrangements is required. Dr. Reid states that, in ventilating the English House of Commons, when it was crowded, he often exposed the air furnished to 5,000 feet of evaporating surface, to impart the necessary moisture, *and subsequently made the air flow through jets of water.* (*Youmans, sec.* 341.)

The ideas that have obtained in the ventilation of the Capitol may be estimated by the statement made to the committee by the present architect, that he proposed to hydrate the air of each hall by passing it over an evaporating surface of 40 square feet. The committee are not prepared to recommend this particular experiment. (A subsequent statement was, 30 feet of heated water, or a surface a little exceeding 4 feet by 7.)

"When dry air is exposed to a source of moisture, a considerable *time* must elapse before it will become saturated. The diffusion of vapor into hot air is much more rapid than into that which is colder, but it is not at all instantaneous. Mr. Daniell observed that a few cubic inches of dry air continued to expand by the absorption of humidity for an hour or two, when exposed to water of the temperature of the surrounding air."

It follows that the dry and warmed air for supplying rooms of great magnitude must be passed over an evaporating surface of great extent, in case that mode of hydrating it be adopted. Doubtless, warming the water would increase the efficiency of the plan. Dr. Antisell recommends spray or jets of water thrown into the air at a right angle to its current, which would no doubt be an effective and satisfactory mode of accomplishing the object where the necessary facilities can be established, among which space is indispensable. The objections to the use of steam, on an extensive scale, for hydration, are, the production of noise, and, as alleged, of odor, and its imperfect dissolution in the air before entering the chamber. It passes on with the current of air for some time before it becomes dissolved and incorporated with it, and moisture is deposited upon all surfaces with which the volume of air comes in contact There is no arrangement for introducing steam into the air passing to the halls, but it was provided for the air directed to the committee rooms and passages. The plan was not found to work well, and has not been in practice.

DUST RISING IN THE HALLS.

4. Dust rising in the halls from the floors. This defect arises from the introduction of air through horizontal openings in the floors, and is an inconvenience which should be abated, if possible.

In Dr. Reid's arrangements for ventilating the former House of Commons, mats and Russian scrapers were provided in the lobbies to secure the greatest possible exclusion of every source of impurity from the floor; the air being admitted through the floor by numerous apertures.

This difficulty of dust rising in the room, as well as the introduction of refuse substances into the horizontal openings in the floor, would be mitigated, though not entirely removed, by the introduction of the air through the risers of the steps behind the seats of members. That was the original plan, but it was abandoned, as was also the free introduction of air into the sides of the room, because of the unpleasant currents produced. No doubt the latter effect would be decreased, if not removed, by proper hydration of the air; for it is quite certain that a current of dry air, although at a high temperature, will produce chilliness, on account of the rapid evaporation caused by it.

INEQUALITY OF TEMPERATURE.

5. Unequal temperature in the halls at the same level. The statements of temperature which appear in the evidence establish and illustrate this point; the temperatures given of the hall of the House are average ones; observations of a number of thermometers, at the same level in various parts of the hall, differing several degrees from each other, being taken. The Senate chamber temperatures are those of single instruments with their particular locations noted, differing, in some cases, five degrees or more from each other at the same level, but on opposite sides of the chamber. The certain result of these differences of temperature is to cause unequal movement of the air and to disturb the regularity of the ventilation. The air will ascend unequally in different parts of the halls, and perhaps, also, some disturbance of sound will be thereby produced.

EXTREME HEAT.

6. Extreme degree of heat in the halls. The thermometrical observations, besides showing differences of temperature, show also an excessive degree of heat. The average exceeds 70°, whereas it should not exceed 65° to 68°.

"In private houses the air should never be allowed to remain above 70° when warmed by heated air; when heated air is used in connection with open fires, or other radiating bodies, the temperature will not often require to be above 65°." (*Wyman*, p. 188.)

"The best temperature for a room is 65° to 68°." (*Youmans, sec.* 21.)

Temperature in former House of Commons.—"The house is heated to 62° before it is opened, and maintained generally at a temperature varying between 63° and 70°, according to the velocity of the air passing through the house." (*Reid, sec.* 659.)

A proper temperature is fixed by Dr. Antisell, in his testimony, at 66°. In fact, a

temperature exceeding 70° in the halls would be intolerable were it not for the aridity of the air; because of *that*, rapid evaporation takes place, rendering individuals less sensitive to the presence of heat. But the degree of heat to which individuals are subjected in the halls is probably injurious, and is in more marked contrast to the external temperature than is desirable. These observations relate to the winter and spring months, but the temperature of the halls in summer is often offensively high during both day and night sessions; for the heat passing through the roof into the halls by day, and the heat thrown down by the lights at night, are equally intrusive and objectionable. There was no necessity for establishing the conditions from which these effects follow; and the heat, which sometimes reaches nearly 90° in the halls, is productive of much discomfort, is injurious to health, and obstructive of legislation. In summer the air is sufficiently moist, but temperature is less subject to regulation than in winter.

COMMUNICATION WITH AIR SPACE ABOVE THE CEILING.

7. The air of the halls is not kept distinct and apart from the air of the spaces above the ceilings. It is, therefore, subject to the influence of the roofs and of the lights. From this cause the ventilation of the halls is disturbed, and rendered imperfect, as will be shown under subsequent heads.

THE ROOFS.

8. The roofs are exceedingly objectionable as they exist at present, composed in part of metal and in part of glass, generating cold or admitting heat according to season, and conducting the noise of storms enormously and offensively to the halls. In erecting them, it seems to have been forgotten that this Capitol was not to be an Egyptian or Grecian temple, under a genial sky, nor even a Roman church, in the mild climate of Italy, but a great structure for the use of legislative bodies, in a comparatively inclement location upon the banks of the Potomac. Windows upon the sides, for lighting the halls, if made double, would not only have accomplished their office more perfectly than a glass roof, but would have protected the air of the chamber from all injurious influence of the external atmosphere, and from the intrusion of all external sound; and even the entrance of solar heat, now enormous, and incapable of regulation by the roof, might have been excluded, by shading, when necessary, the windows exposed to it. Light from side windows would be soft, natural, cheerful, and diffused, producing perfect illumination of the whole interior space, including the galleries, now so unequally and imperfectly lighted. And, finally, windows, unlike the roof, might be thrown open at pleasure, and thus, at proper seasons and upon fit occasions, rapid and thorough ventilation of the halls secured.

THE LIGHTS.

9. The particular arrangement for lighting the halls by gas jets above the ceiling is another defect requiring attention. The jets are very numerous—those used for lighting the hall of the House exceeding twelve hundred in number. The amount of heat created by them is very great, and the quantity thrown down into one of the halls at a night session increases the temperature of the hall from three to five degrees. This is peculiarly disadvantageous in summer, and renders night sessions uncomfortable, there being no effective arrangement for cooling the hall. There is an unnecessary consumption of gas, and the products of combustion are not effectually removed.

Dr. Reid says: "When any vitiated air is produced by a gas lamp or other artificial light, or by any manufacturing operation, too much importance cannot be attached to the desirableness of involving it directly in a stream or current of air by which it is conveyed to a channel where it cannot possibly contaminate the air of respiration." (S. 458.)

It is to be remembered that there is extensive communication between the hall and the air space above the ceiling, where the lights are placed, through numerous apertures along the ceiling, allowing impurities of combustion to pass into the halls with any downward current. And Dr. Antisell explains, that the accumulation of hot air under the roof without sufficient means of exit is to back up against the outgoing currents from the hall and prevent their escape.

There can be no doubt that comparatively few lights arranged with reflectors and ventilating chimneys would light the halls perfectly, would throw down but little heat into them, and would thoroughly ventilate the air spaces above the ceiling, assuming that they were cut off (as they should be) from any communication with the halls.

IMPERFECT REMOVAL OF AIR.

10. One principal defect of ventilation is, the imperfect removal above of the vitiated air of the halls. Under this head two points are to be considered: 1st. That the

avenues of escape for the air are inadequate; and, 2d, that no exhausting power is applied. Whatever of escape takes place is simply from the natural ascent of heated air, and this action is insufficient and irregular from defective arrangements. In the case of the Senate hall the apertures for the escape of the air have a deficient capacity of one-sixth as compared with the entrance shaft, or passage below. The velocity of escape is deficient also to the extent of one-third as compared with the entrance movement produced by the fan. Great irregularity and imperfect ventilation are the necessary results.

As to the application of artificial power for the removal of the air, Dr. Antisell says: "The chief power should be placed at the point where the air is thrown out or removed from the building. I look upon a fan for the introduction of air as of secondary importance compared with a fan placed at a point where the air is removed. The object is to remove the air that has become impure, and it may be done much easier and with more certainty if the power is applied at the removing point."

Question. "Do you consider the application of power for the removal of air from a chamber more important than for its introduction?"

Answer. "Certainly; that is the main point. The main power should be applied where the air is to be removed, and for this reason: You are never sure, in driving air in, that it arrives at the point desired; but if you take it out of the room the thing is palpable."

Now, at present, the air is forced by fans into the halls and then allowed to take its own course, subject, however, to all the disturbing causes which exist in the halls or above them. No power is applied to produce certainty and regularity in its removal.

CARBONIC ACID GAS.

The presence of carbonic acid gas in the halls is, no doubt, in excess of the quantity contained in the external atmosphere, but the committee have not been able to obtain any exact determination regarding the quantity present, either at ordinary sessions or upon extraordinary occasions. The detection of this gas, and an exact determination of the amount of it contained in air, require skill, careful attention, and instruments and materials of analysis of much perfection. Of atmospheric air in a state of ordinary purity, carbonic acid gas constitutes but about four parts in ten thousand; and even in air overcharged and rendered unhealthy by its presence, the quantity contained is exceedingly small. But the examination upon this point now being prosecuted by Dr. Charles M. Wetherill, of the Smithsonian Institution, will furnish information approaching exactness, as his capacity and fidelity are both unquestionable. In the absence of reliable information, no clear opinion can be formed upon this subject, but the committee are induced to think that the contamination of the air of the hall from this cause is not very excessive or injurious. The reasons for this opinion are, the great size of the halls, the fact that notwithstanding defective movement of the air in ventilation, the quantity of air removed within a given time must be very considerable, and that the halls are usually occupied but a few hours at one time. Upon extraordinary occasions, when the galleries are well filled, it is probable that defective ventilation permits an unhealthy accumulation of this pernicious gas, and its enormous production by the lights, without perfect exclusion from the halls, may produce contamination of the air, even below the ceiling.

Such, then, are the existing defects to which the attention of the committee has been directed, and they may be briefly summed up as follows:

That the air is taken from an improper place, where it contains dust and is over-heated in summer. That it is over-heated by steam-pipes. That the air as introduced into the halls during the winter and spring months of the year does not contain more than one-third to one-half the moisture or vapor of water required at the temperature to which it is raised. That its aridity is a capital defect, and demands radical change and amendment. That dust rises in the halls from the introduction of the air through the floors. That temperatures are unequal in the halls at the same level.

That the heat is extreme in the halls, at least by 5° or 6°, and most excessive in summer, both by day and night, from the influence of the roofs and lights.

That the air of the halls is not kept distinct and separated from that between the ceilings and roofs.

That the roofs are very objectionable both from their construction and the materials of which they are composed, and that for the glass roofs, side windows, made double, would be an admirable substitute.

That the present arrangement for lighting the halls is bad.

That the removal of the air from the halls is imperfectly accomplished, the outlets being inadequate, and no exhausting power provided.

THE PLAN OF IMPROVEMENT.

The changes and improvements proposed by Mr. Anderson, the architect, are stated in detail in his report to the committee, which is appended hereto, and are shown and

illustrated by his plans and drawings which accompany it. He proposes to obtain air from situations upon the bank west of the building, through vertical shafts of some elevation; to conduct it through protected passages into the sub-basement, and then conduct it upwards through appropriate passages to air-chambers outside and near the upper part of the halls. From these distributing chambers it is to pass through ducts over the ceilings, and obtain admission to the chambers through the present apertures in the ceilings. The entire movement of air so far is to be produced and regulated by a powerful fan placed near the bottom of the ascending passage, and provision is made for warming the air upon its way by hot-water pipes, and for cooling it in summer by the use of ice. He proposes also to place jets of water in the outer entrance shafts, and to provide most ample and effectual arrangements for hydrating the air before it reaches the ceiling. The space at command will enable this to be done perfectly, thus removing wholly one of the main defects in the existing arrangement. The removal or exhaustion of the air from the halls will be through the floors and through the present passages used for the introduction of air, powerful fans being again used for accomplishing this purpose.

THE PLAN CAN BE REVERSED.

Now, whatever opinion may be formed of the merits of the plan thus far, as to the movement of air in the process of ventilation, it is manifest that it possesses the merit of being capable of exact reversal. At any time, if desired, the air may be introduced from below, conveyed upward through the halls, and exhausted through the proposed entrance-passages of the place; in which case it would become, as to its general features, almost the identical plan successfully adopted by Dr. Reid for the ventilation of the former House of Commons. In fact, such reversed plan would have a material advantage over the Reid arrangement in the use of an effective exhausting-fan instead of a fire and chimney. Dr. Antisell and Mr. Cluskey correctly state that such reversal of the plan, as to direction of the movement of the air, could be made with little expense and alteration if desired hereafter. This consideration meets any possible objection to the downward movement of air through the halls, by those who may not be convinced of its utility, efficiency, and success.

ELEVATION OF CEILINGS AND ROOFS.

But a most material part of the proposed plan—that which involves most of expenditure and requires most of careful investigation—is the elevation of the ceilings and roofs, with the accompanying and consequent changes.

It is proposed to elevate the ceiling and roof, in each wing, about fifteen feet; to make the roof double, the inner one counter-ceiled with non-conducting material; to substitute a limited number of lights, with reflectors and ventilating chimneys, for the present numerous gas jets, and to insert windows around the whole upper part of the hall in the space gained by the elevation of the ceiling and roof. Thus, the air-space above the ceiling, separated entirely from the ducts through which the air for the hall is introduced or exhausted, will be ventilated by the chimneys of the lights; all the products of combustion will be at once removed; abundant light, with little heat, will be produced; all influence of external heat or cold and all noise from storms will be prevented by the double roof and the insulated air space above the ceiling, and perfect illumination of the hall and galleries, with other advantages, secured by the side-windows introduced. There can be no doubt that these would be most valuable improvements upon the points involved in this inquiry, to wit, the heating, ventilation, and acoustics of the halls of Congress.

The laws of architectural proportion require the elevation of the ceilings, and the appearance of the halls (and particularly the hall of the House of Representatives) would be greatly improved thereby.

The original plan of Mr. Anderson, which was mainly followed in the construction of the halls, and in their location in the center of the wings, contemplated windows above, as now proposed, and it is not likely that any competent architect would ever propose such rooms, so located, without any possible access to solar light except through the roofs.

Besides, it is insisted upon by professional gentlemen, and appears to be true, that the architectural effect of the Capitol, viewed externally, would be improved by the moderate elevations proposed to be added upon the wings. The sky line of the structure would be somewhat broken, which would comport with the style of Roman art upon which the Capitol was originally designed—the Roman-Corinthian order—and the attention now fixed, concentrated, and absorbed by the great central dome, would take in the whole structure and recognize the wings in which the great legislative houses, composing the Congress of the United States, are assembled.

The elevations would recede inward some distance from the outer vertical line of the wings, and none of the present or proposed exterior work upon the wings would be disturbed.

OBSERVATIONS UPON THE PLAN.

Recurring to the details of the plan of changes already stated, the committee have some additional observations to submit upon particular points.

It is questioned by a most competent witness examined by the committee, whether entrance shafts for the external air so high as 25 or 30 feet are necessary or expedient, and also whether jets of water in those shafts would be an advantage. The committee conclude that neither point is very important, and, however determined, will not materially affect the general plan; a proper place for obtaining the air being the main object to be secured in the first instance. As to passing the air over ice in the summer for the purpose of cooling it, the committee think that the use of cold water in the pipes used in winter for warming the air would usually be sufficient for a proper reduction of temperature. In hydrating the air the use of an extensive system of jets or spray of water, reasonably warmed, in the ample space at command by the plan, would be the most efficient and satisfactory. Any use of steam must be in moderate quantity, and at some considerable distance from the point of entrance into the chamber, to permit its perfect absorption and dissolution in the air. Level evaporating surfaces would require to be of great extent; their arrangement might impede the movement of the air in ascending, and might cause accumulation of dirt or impurity. The plan of hydration here suggested is contained in the testimony of the intelligent and able witness already mentioned, and is concurred in by the architect. Another suggestion from the same source, as to an easy improvement of the openings of the ceilings for the passage of air, is believed to be judicious. The windows to be introduced into the upper part of the halls should unquestionably be double, and, in the opinion of the committee, no stained glass should be used in their construction.

THE DOWNWARD MOVEMENT OF AIR.

But one additional feature of the plan remains to be considered—the proposed downward movement of the air through the halls. In his "Notes upon Acoustics and Ventilation," submitted by Captain M. C. Meigs to Jefferson Davis, Secretary of War, May 19, 1853, the advantages of the descending movements are stated to be, the avoidance of all eddies, a nearly homogeneous and tranquil atmosphere, and the immediate removal downward of any dust from the carpet, which would thus be prevented from rising to be inhaled into the lungs; and it is insisted upon that good acoustic results would be secured. The plan of Captain Meigs for the ventilation of the halls of Congress was undoubtedly derived from Mr. Anderson, whose plans, with printed explanations, were in his possession for some time, and obviously adopted and followed to a great extent in the construction of the wings. The "Notes on Acoustics and Ventilation," elaborating the advantages of the descending movement, are therefore appended to this report, and in connection therewith the emphatic indorsement of them as correct and judicious by Professors A. D. Bache, of the Coast Survey, and Joseph Henry, of the Smithsonian Institution. The views thus presented and indorsed were the views of Mr. Anderson, and are exactly applicable to the plan now proposed by him, and they retain whatever of soundness and force they possessed in 1853, notwithstanding they were subsequently departed from in the construction and arrangements of the halls.

But there are two material advantages of the descending movement of air which were not stated in the "Notes" referred to, to wit: the equalization of temperature in the halls, and particularly near the floors, and the economy or saving of heat; both of which are important and evident. They are stated by Dr. Antisell, and to be taken into consideration in determining the plan now under consideration. For the difference of temperature upon opposite sides of the hall, constituting one of the existing defects, would be wholly avoided by the downward movement. The tendency of the air after its admission at the ceiling, and during its progress to the floor, would be toward equalization and uniformity of temperature, and the *movement* also would be comparatively regular until acted upon very near the floor by outgoing currents. The argument, therefore, for improved acoustics by the downward movement, as given in the "Notes," is strengthened by these considerations. The facility of heating the hall, and economy in the use of heat for that purpose, would also be greatly increased; for a considerable time is now required for warming one of the halls, inasmuch as the heated air when first introduced passes rapidly to the ceiling and roof, the colder air remaining in, or falling to, the lower parts of the hall. The process must therefore be continued until the entire space is thoroughly warmed, and if the air is introduced at a proper temperature several hours will be required for this purpose. Besides, a great amount of warm air is wasted in heating the space between the ceiling and roof, and a large amount necessarily lost by the roof itself, as before mentioned. But in introducing the air above, as proposed, with an exhausting power below, the room can be warmed rapidly, the exhausting fan withdrawing the cold air with certainty and dispatch and permitting its place to be occupied by the descending

volume of warm air. No heat will be lost by the roofs, nor diverted to the air spaces between them and the ceiling.

The "Notes" correctly state that, "by a steam-driven fan, or other mechanical means, we can pump air, in any desired quantity, into any spot to which we choose to direct it."

The fan is now the accepted instrument for the movement of air by either the plenum or vacuum impulse, where great efficiency is desired, and its improvement has been carried so far as to leave little to be desired. Where the size of a building warrants its use, it gives any desired power with certainty and cheapness, and is capable of adjustment in almost any position where the limited space required by it can be obtained. And it has superiority over a chimney with fire, in its capacity to move air in *any* direction, and to move it regularly and with greater efficiency. Placed as a power to supply or exhaust a room, its force can be exactly calculated and the result intended precisely accomplished. The exhaustion of the air of a room by it in a downward direction can be made at pleasure. It is simply a question of the application of a power entirely at command, in an intelligent manner.

A few notable instances of downward movement in ventilation may be mentioned, and first that of the model Pentonville Prison, of which Professor Wyman says: "The arrangements which have been in operation ventilating and warming the cells, and maintaining an equable, general temperature within the prison, have been attended with complete success." The air is introduced through horizontal passages warmed by hot-water pipes, and, passing upward along flues, is admitted into each cell at the top immediately under the ceiling. It is withdrawn from the cell on the opposite side, at the floor, and passing upward through flues is eventually discharged by a high shaft above, into which the smoke-flues from the heating apparatus also enter. "It will thus be seen that a communication is established, first, from the outer air through the warming apparatus to the top of each cell, and thence from the floor of each cell through the extracting flues and ventilating shaft into the outer air again."

"A perfect diffusion of air takes place in the cell, the difference of temperature at the ceiling and floor can scarcely be detected, and will seldom exceed one degree, and it may be inferred that the difference of power required for extracting the air at one or the other of those levels would be inappreciable."—*Wyman.*

Of course, if the air were required to pass down from the cells to the basement, some appropriate power would be necessary to accomplish the movement.

The ventilating movement of air, as above described, is assisted in the winter by the smoke and disposable heat in the shaft above, from the heating apparatus, and in summer a small fire, maintained at the bottom of the shaft, is used. In short, the assisting power used is very slight, and yet it is said by an intelligent author that, "so admirably is the ventilation of the building contrived and kept up that there is not the least sense of closeness prevading it; for we feel, immediately we set foot in the place, how fresh and pure is the atmosphere there."—(*Mayhew's Prisons of London*, p. 120.)

A diagram of the fine Portland prison, showing the introduction of air into the compartments, both above and below, on one side, and its exhaustion on the opposite side at the floor, is to be found in the Prison Commissioner's Report, volume 29, for the year 1850.

In the case of the New York Hospital, upon Broadway, designed by Mr. Anderson, and where the plan of ventilation is successful, the air is obtained through shafts of neat appearance about twelve feet high, placed outside the building; is carried into a passage of the sub-basement, from thence admitted to the heating apparatus above, there warmed by hot-water pipes, and permitted to ascend and enter the wards upon the sides. It is removed upon the opposite side, through openings into flues above and below, either of which may be used, but those at the floor are found most efficient in practice, and remove all offensive odors of wounds and sickness from the room. The exhausting flues are connected with a small room above, in which hot-water pipes are placed to assist the movement and discharge of vitiated air. The statement of the engineer in charge is attached to this report, and confirms the opinion of a member of the committee who visited the building, that the air of the wards is good, and the whole arrangement of ventilation judicious. The use of a fan would increase efficiency of movement, if that should be desired, in this or any other building of like arrangement.

In the case of the new emigrant hospital now in course of erection on Ward's Island, New York, the air is obtained through an elevated shaft placed some distance from the building, and conducted through brick ducts, and then upward through iron shafts, through openings in which it is admitted into the different wards. It is removed through openings near the floors, behind the patients' beds, and discharged into the atmosphere in the usual manner. The letter of the architect, describing the plan, is hereto attached.

OBJECTIONS CONSIDERED.

Professor Wyman states very clearly the objections to the downward movement of air which have prevented its general adoption in buildings with much force and clear-

ness; but it will be observed that they have no application to the plan now under consideration. The first is, that this movement requires that the openings for the escape of the air should be nearly as numerous and diffused as those for its admission in the ceiling, and for most evident reasons. Ordinarily, however, such numerous apertures at the floor cannot be secured; but in our case they already exist, and the objection fails. Another objection in ordinary cases is, that in the downward movement the lights must be provided with air entirely separate from that which supplies the room, in order that the gases and other products of combustion shall not be breathed. But in the present plan the separation of the space where the lights are placed from all communication with the air of the hall is one of its main features, and easily secured. We may add, that the perforation of the ceiling for the diffused admission of the air is often inconvenient or impossible, and that facilities for operating an exhausting power below do not exist. None of the ordinary difficulties opposed to the descending movement are, therefore, to be encountered in the present case. Its practicability, however, is admitted by our author in strong language, and its desirability indicated where the conditions exist for its application. He says: "The flow of air may, when under the control of an efficient moving power, take any direction that may be desired; it may move from below upward, or the reverse, or in both directions at the same time. * * There is no impossibility of producing a constant and equable downward movement. * * * The unoccupied ceiling, in its whole extent, may be used for the admission of air, which may reach the lungs uncontaminated by dust or contact with the body. This is the movement which constantly arises in rooms heated by means of fire-places, &c."

He explains that heated air first rises to the ceiling and afterward, upon cooling, descends, and is removed by the chimney.

It is a common practice in ventilation, upon the removal of ascending air at the top of the room, to take it down a side passage and deliver it into the external atmosphere. This may be accomplished by a fire-place at the bottom of the passage, connected with an upright shaft or chimney, as in the case of the temporary House of Commons, or much better, both as to efficiency and regularity, by an exhausting fan. But manifestly this downward exhaustion of air accomplished in the side passage may be accomplished equally well in the room itself as to air introduced at the ceiling.

Only one point remains to be noticed under this head—the ascent of impurities from the bodies of persons occupying a room. Evaporation from the skin and air breathed from the lungs convey impurity to the air, and cause an ascending movement in the first instance, and it is said that from this cause the descending air may be contaminated before it reaches the person. It is true that air breathed from the lungs is usually warmer than the air of the room, and has an ascending force mainly due to the elasticity of its watery vapor. But its superior temperature is quickly lost, and in accordance with the well-known law of diffusion of gases, it becomes incorporated with the descending air, and passes downward. As some time is necessary to contaminate the air, it follows that in a descending movement all impurity is removed below the region of respiration before it becomes appreciable or injurious; and as the whole air of the room is changed within a period of less than ten minutes, there can be no such accumulation of impurities in any particular section of air as to render it offensive or objectionable. The floors of the galleries being perforated with numerous openings for ventilation, no vitiated air produced there will pass down to the floor of the hall.

The committee has given this elaborate examination to the subject of ventilation by a downward movement of air, not because its approval is indispensable to the plan proposed by the architect, but because it is desirable to adopt a plan which will allow the application of that particular arrangement. The plan will stand good for an upward movement of air through the halls, but, for the reasons already given, sustained by the authorities cited, the downward movement appears to promise the most complete and satisfactory results in ventilating the halls of Congress.

RESUMÉ.

In summing up the whole case upon the architect's plan, it may be stated to involve the elevation of the ceiling, the insertion of side windows, the removal of the glass roof and substitution of a double roof, the separation of the air-space above the ceiling from all communication with the hall, the substitution of fewer lights, with reflectors and ventilating chimneys, for the present lights, the introduction of pure air from an external point by a fan, with proper warming and thorough hydration, and its effectual and regular removal from the hall by an exhausting fan; and, by the plan, either an upward or downward movement of air through the hall may be established; a change from one movement to the other requiring only a change of location in the heating and hydrating apparatus. Upon the merits of the plan, reference is made to the testimony of Mr. Cluskey and the other witnesses, and particularly to the following question and answer in the examination of Dr. Antisell:

"Question. What do you say as to the feasibility and success of Mr. Anderson's whole plan, as compared with the present arrangement?

"Answer. It would be much more effective than the present plan, and feasible in its details."

The evidence of the same witness upon the utility and advantages of an exhausting fan in ventilation is also worthy of particular notice.

THE ESTIMATES.

The concluding subject for examination under the resolution appointing the committee is the cost of the proposed changes. The careful and elaborate estimates laid before the committee, and herewith reported, show a total expenditure for the Senate wing of $113,185 25, independent of an attic, for the erection of which the estimate is $37,500. For the House wing the expenditure is $15,921 30 more. The erection of an attic upon it would cost the same as for the Senate wing, being of the same size. These estimates are made at the present prices for labor and materials, and, as to nearly the the whole proposed outlay, assume the form of proposals by a competent party. Underwritten his estimates for the wings, respectively, (including nearly the whole of the work and materials,) Benjamin Severson, the directing engineer in erecting the present ceilings and roofs, proposes to execute a contract at the prices stated, and to give ample security for its performance.

If the plan of improvement now submitted to the two Houses be regarded with favor, the committee recommend that the improvements of the Senate wing be executed between the termination of the present and the commencement of the next session of Congress. There will be ample time for this purpose, and an advantage in concentrating attention and effort upon the one wing. In proceeding, subsequently, to the improvement of the House wing, the temporary roof, fixtures, and implements used in the work upon the Senate wing can be transferred to the other; and any improvement or modification of details in the general plan can be applied in executing the work upon the House wing.

The expenditure for the Senate wing, exclusive of the attic, will fully secure all the changes and improvements proposed in the plan examined by the committee; in other words, will secure the elevation of the ceiling and roof, with side windows and all the arrangements of ventilation. Attics, however, will properly follow the other proposed changes, and are required for architectural effect. Marble, already on hand, can be made available in their construction.

With this question of expenditure upon the proposed improvements, a collateral one, relating to the wings, may be considered. The present plans of the Capitol extensions indicate expensive colonnades upon the north, south, and west sides of the building, to be placed upon the arcades already erected, and an appropriation of $300,000, applicable to their construction, was made at the last session. That appropriation remains unexpended, and the question arises, whether it would not be well to withhold it from the volume of public outlay. There is no necessity for the present expenditure of this large sum, and the utility and advantage of making it, at any time, is matter of debate. Mr. Anderson, in his testimony, says:

"I recommend that you finish these arcades with cornice and balustrade at the top, which will produce a good architectural effect by carrying out the principles of a Roman structure more fully than to finish them as heretofore proposed. It is not intended to put porticoes but colonnades over the arcades. The plan is to carry round the entablature on those colonnades. The effect of it would be simply this: A column before each pilaster has no object of any kind effected by it. It involves an additional expense of marble-work and excessive weight, without any possible advantage. Standing at right angles with the building these columns would not be seen more than the pilasters would which stand by them; they would merely obscure the pilasters, and at the same time deprive the numerous offices on each side of the building of air and light. It is an object in architecture never to introduce an ornament without a purpose. In every well-designed architectural building there never is an ornament introduced that has not its object, which this feature of the design of the Capitol has not. The same observation is applicable to all of the four colonnades—north, south, and two west. * * * * A balustrade would be a great deal cheaper than the other plan, and it would, at the same time, admit more air and light."

These views seem to be forcible and just, and are, therefore, brought to the attention of Congress for consideration.

Upon due reflection, the committee are induced to submit the question of withdrawing the appropriation for the colonnades, or at least deferring the expenditure, in view of an inquiry through an appropriate committee as to their utility and merit. If balustrades can be substituted for them without disadvantage, a very large amount of money can be saved to the Treasury, and the burden of the expenditure now proposed by the committee for real and necessary improvements in the Capitol wings be mainly avoided.

ARCHITECT'S REPORT.

To the honorable the Joint Select Committee of the Senate and House of Representatives of the United States on the subject of lighting, heating, ventilating, and the acoustics of the two halls of Congress.

The report of Charles Frederick Anderson, architect and civil engineer, of the city of Washington, D. C., most respectfully represents—

That in obedience to your appointment and directions, made in pursuance of the concurrent resolution of the two Houses of Congress of the 10th of May last, the undersigned has diligently applied himself to a minute examination of the various parts of the north and south extensions, and to the various plans and drawings of their several parts which will necessarily have to be used or which will be slightly affected by the plan by which he proposes to improve the lighting, heating, ventilating, and acoustics of the halls of Congress, with a view to discover the most direct, easy, and economical manner in which the plan can be applied to the structure as it now exists.

This examination has the more strongly and clearly developed the errors of those parties having charge of the construction of these extensions, in departing from the plans which the undersigned had the honor to furnish for the accomplishment of these objects, and which had been submitted to President Fillmore, and been supported by Mr. Webster, then Secretary of State. During the administration of President Pierce, these same plans were submitted to him, and fully examined and approved by Montgomery C. Meigs, then captain of United States Engineers and superintendent of the Capitol extension, and by Professors Bache and Henry, and were also approved by the Secretary of War, under whose direction the works had been placed, as will fully appear by the documents appended to this report; and yet, strange as it may appear, Captain Meigs, in his actual construction of the extensions, not only rejected this plan for the lighting, ventilating, and heating of the legislative halls, but actually reversed the whole system, making the error radical, and therefore more difficult now to remedy or correct. However, by a thorough study and examination of all the parts, the undersigned flatters himself that he has (by his accompanying plans) established the means of making the desired improvements with the least possible alteration or change in the interior arrangements; none, in fact, which will occupy any material apartments or space of the extensions, or injure or interfere with the present appearance and arrangement of the halls of Congress in any way, except to lighten up and greatly improve their interior appearance, as well as the exterior superstructure; all of which will be shown and explained by this report, and by the drawings and plans herewith submitted.

The erroneous plan adopted by Captain Meigs, which has been operating since the occupation of the halls, and now exists in both Houses, receives the exterior air under the ground floor from off the surface of the overheated and dusty terraces, furnishing much of the bad air from beneath, carried to its surface by evaporation and side currents of air from the ground, and this air is also tainted with much of the odors caused by the machinery near which it passes.

The air injured by these causes is drawn to the openings in the cellar or sub-basement walls by the action of the fan-wheel, which forces it up under the floors of the two houses, where it finds vent through the gratings under the members' desks, the risers in the floors, and openings round the halls, and in the galleries. By the action of these currents the vapors introduced from below rise from the floors of the halls, and keep in constant motion the vitiated air generated by the breath of the persons occupying the floors and the galleries, of which carbonic acid gas, being heavier than the purer part of the atmosphere of the chambers, is constantly tending to and settling upon the floors, and would remain upon the floors, like a malaria or noxious miasm, were it not kept in motion near the floor by the currents of dirty air coming up through the gratings and registers; there is added to this bad air all the dust produced by the walking or movements upon the floor, independent of that brought from below. This atmosphere of the halls, as at present arranged, cannot be otherwise than unwholesome, and, were it not for the frequent opening of the doors leading into the halls, would prove much more oppressive and intolerable than it is. To persons of weak lungs, however, the deleterious effects of the present arrangement are more immediate and sooner felt than by persons blessed with more robust constitutions; but even these may be taken sick without any apparent cause, unless it can be traced to the fact that the seeds of the sickness have been unconsciously imbibed while sitting quietly in their seats, and much more so while engaged in speaking, or in the heat of debate, when the lungs must of necessity become inflated and irritated by this pernicious atmosphere.

From these remarks it will be manifest to the plainest understanding that a great error has been committed in attempting to furnish the proper air to the halls, passing it through and mixing it up with the vitiated air as above explained, instead of introducing the pure air into the upper elevation of the halls, and drawing down the im-

pure atmosphere through the gratings in the floor. Having thus simply explained the errors of the present system, it is the purpose of the undersigned to explain the principles and the manner in which he proposes to remedy the existing errors and defects, and furnish to the national councils a pure, temperate, and refreshing atmosphere, of an equal temperature at all seasons, in which members may with safety exercise their lungs while conducting the high and important legislation of the country, with ease and pleasure, and without any apprehension of receiving injury from the medium through which their views, arguments, and business transactions may be expressed in the two Houses.

To accomplish this purpose, the undersigned will endeavor to be as succinct as the nature and the importance of the case will admit of, and, with this view, will divide his explanations as follows, viz:

1st. The undersigned proposes to furnish an abundant supply of fresh, unadulterated air, rarified in winter, hydrated, purified, and cooled down to any desired temperature in summer, to the halls of Congress, so as to insure a uniform temperature at all seasons, with a healthy atmosphere, to be effected by vertical air-shafts to be built on the banks on the west side of the Capitol extension, one for each wing, twenty-five feet high over the level of the flagged terrace, and in the position marked on the accompanying plans of the sub-basement floors, (*specified by the red tint;*) through these shafts pure air, procured from that elevation, will pass into the air-chambers on the sub-basement floors, through dry tunnels, seven feet six inches in diameter, built of hard brick and cement twelve inches thick, and cemented on the inside, so as to make them impervious to damp, with a fall to the vertical shaft, in which shaft a jet of pure water will play at discretion, and be capable of adjustment in the engine-room.

In the sub-basement air-chambers are iron stands on which to pile ice in hot weather, and through which the hydrated and purified air will have to pass to the fan-wheel, which will force it upward through the building in the upper air-chamber arranged outside of the chamber walls, and from which it will pass into the halls of Congress through close air-tight ducts, made of two thicknesses of thin galvanized sheet iron four inches apart, filled in between with crushed pumice stone and liquid cement, passing through the perforations in the ceiling as through a sieve—this perforated portion of the ceiling forming the under side of these air-ducts.

The large upper air-chambers outside of the halls will be arched over with brick and cement, so as to render them impervious to the influence of the exterior atmosphere, either hot or cold, and the air-ducts on the ceiling, which are fed directly from these large air-chambers, are packed on three sides with non-conducting material, as before described, so as to transmit this purified, cooled (or rarified) air to the halls without being sullied by its passage through the atmosphere over the glass ceiling.

The undersigned has arranged four new fan-wheels to carry out his plan, two to force the air up and two to withdraw the vitiated atmosphere from the floors; one for each House. These are so formed as to possess five times the power of the present fan-wheel, but the power is completely under the control of adjustment. The flow of air into the halls may be required, and will be regulated by the speed of the fan-wheel, which depends on the action of the engine.

When very cool air is required in excessive hot weather, we can lower the temperature of the exterior atmosphere to any extent desired, in the halls of Congress, by placing ice in the vertical shaft as well as in the lower air-chambers, and still further by the use of salt with the ice.

All this air passes from the vertical air-shafts through the tunnel, which will be built into and covered up from the effects of the atmosphere by the present bank of earth extending to the basement air-chambers, and from thence up through the building to the upper air-chambers which supply the air-ducts over the ceiling; will be made close, clean, and pure, with a drain built at the bottom leading to the vertical shaft from the lower chamber and the ice cellar, to take off the water introduced by the jet, the melting of the ice, or the rain-water in the vertical shafts.

The undersigned has also annexed the adjoining cellars in each wing (now useless) for stores or ice-houses, where a supply can be kept convenient to the lower air-chambers for daily use when required. In cold weather steam admitted through the cluster of pipes now in use, but placed in the new air-passage, will rarify the air to any temperature required on its passage to the upper air-chamber, through which chamber a stream of pure water will be made to flow, so as to hydrate the heated air before it enters the halls. This can be accomplished by allowing the steam of either warm or cold water (to suit the temperature of the air) to flow over a continuous tray the full length of the upper air-chamber, fitted with a gauze wire bottom and divided into compartments, so as to be able to adjust the amount of mist through which the ascending air will pass at right angles. The temperature of this air, subsequently, will receive additional protection at certain seasons by the admission of air through a register from the upper air-chamber to the space over the glass ceiling, and the influence of the exterior atmosphere will be kept off the glass ceiling by means of a counter-ceiling placed on the back of the iron rafters which support the roof and the ceiling, which rafters it

will be necessary to strengthen to double their present capacity. This counter-ceiling will be composed of crushed or broken pumice stone, filled in with liquid cement, resting on thin corrugated galvanized sheet iron; it will be five inches thick, packed close, made air-tight, and plastered on top with cement. This counter-ceiling will prove to be a non-conductor of heat, cold, or sound from the exterior copper covering of the roof, leaving a space of three feet between the exterior covering and this counter-ceiling.

This plan will effectually prevent the changes in the weather, either by heat, cold, or storms, from affecting the glass ceiling as it does at present, and which has been so much complained of; in fact, the temperature of these halls could never be properly regulated so long as the exterior atmosphere could control the temperature of the space over the glass ceiling, which is at present assimilated to a hot-house in summer and an ice-house in winter, besides transmitting noise from the effects of hail and rain storms, so annoying to the members of both Houses of Congress. It will be only fair to all parties that it should be known that this system of lighting the halls of Congress by means of sky-lights is the only part of Mr. Walter's two designs which has been brought into operation by Captain (now General) Meigs, and which injudicious act is a principal cause of the heated ceilings and bad acoustics.

The undersigned proposes, as an extra or auxiliary means of heating the halls of Congress in very cold weather, to place ornamental benches in the angles of the halls and in the hat-rooms, filled with coils of steam-pipes, to supply additional heat on the floor of each House, which will obviate the necessity for heating the upper current of air too highly to be pleasant.

2. The undersigned proposes to withdraw the vitiated air from the chambers without its remaining above the floors to become injurious to the occupants, and at the same time to regulate and insure good acoustics to both halls of Congress.

To accomplish these objects, the present system will have to be completely reversed, by using the same apertures for withdrawing the vitiated air from the halls of both Houses and from the galleries that are at present used for admitting the air into these apartments, being the registers on the floors, in the galleries, and in the screens which inclose the halls, &c.

This will be accomplished by means of powerful fan-wheels made to work in the passages, which at present admit the air, and in as close proximity as possible to the openings under the floor, through which these fan-wheels will withdraw the vitiated air. The power of these exhausting fan-wheels upon this air can always be regulated to a certainty by their velocity, which will be controlled by the action of the engine.

The current of fresh air passing through the halls downwardly will also be regulated in a great measure by the action of these exhausting wheels, which will regulate the acoustics, as will be made evident from the fact that the voice can no longer ascend to the roof and be lost in the space over the ceiling, as at present. The compressed air forced through the perforations in the ceiling as through a sieve will oblige the voice to remain in the body of each House, it being an axiom in the science of acoustics that glass, next to water, possesses the greatest attraction for sound. The attraction of the voice produced by the glass-paneled ceiling over both the halls of Congress, as at present, will be obviated altogether by the introduction of the imperceptible flow of pure air into each House from the ceiling. As sound always accompanies the current of air, it will be decoyed from the glass ceiling and conveyed into the body of the chambers and into the galleries, as above described, without a reverberation of the voice produced by the present low glass ceiling. The proposed elevation of the glass ceiling, besides improving the architectural proportions of the chambers, will materially assist in establishing good acoustics, as the large field of attraction for the voice will be further removed from the floor, besides being intercepted or arrested on its passage to the ceiling by the incoming flow of pure air through the many apertures in the ceiling, and a greater space will be afforded for the action of that incoming current to mix with the air in the chambers before it reaches the floors.

The undersigned recommends that the system heretofore specified in the printed explanations which he furnished to Captain Meigs in 1853 be now adopted for conveying and dispersing the superabundance of sound on the floors to the galleries, and to the reporters' desks in particular, by inserting open slits in the surrounding screen to which will be attached zinc tubes, which will arrest the voice and convey its redundancy from off the floor to the galleries. It will be perceived that by this system the voice cannot escape from the halls in consequence of this plan for admitting the pure air, and by means of these tubes the vibration of the voice or echo will be altogether done away with, so that the full effect of the voice will be rendered more agreeable by this wholesome atmosphere produced by purified and compressed air. It will be seen by the accompanying plans that this change can be effected without interfering with the arrangements on the floors or galleries in either House, or the surrounding corridors, passages, or offices, in any way save by the occupation of one or either of several spaces, the selection of which may well be left to the honorable Committee on the Public Buildings, or any other authority deemed most appropriate, to select a passage

for the pure air from the basement to the upper air-chamber, which can be spared with the least inconvenience; that is, if the passage laid down on the plans for the Senate wing be not approved of. With this exception, it will be perceived by the drawings that this plan for securing good ventilation, &c., interferes with nothing in the halls that can be visible under the level of the cornice of the present ceiling which surrounds the halls of Congress; everything below that level will remain as at present arranged. According to this plan there will be two objects attained: first, to establish what is required by the concurrent resolution; and, second, that it may be effected with as few changes and at as small an expenditure of time and money as is possible. Such a change, however, in the present halls of Congress might be considered cheap at any cost, as it will insure the health of the nation's representatives.

3. This plan will furnish a good and agreeable direct light by day from windows opening on the exterior atmosphere, with a steady, clear gas-light by night, descending through the present glass-paneled ceiling, as elevated, but without the accompanying heat produced by the great number of gas-burners at present distributed all over the ceilings of the two halls of Congress, numbering about one thousand four hundred over the ceiling of the House of Representatives alone, the effect from which renders the heat of the glass and iron ceiling particularly oppressive.

To remedy the present defects, it is proposed to raise the ceilings over the two halls of Congress about sixteen feet, which will produce much better proportioned apartments, as the height of the present ceilings is altogether at variance with architectural rule or the laws which govern architectural proportions. This change, besides improving the architectural appearance of the halls, will afford room to insert a tier of windows extending all around each hall under the cornice and over the gallery doors, as shown by the accompanying longitudinal and cross sections. These windows will be the exact size of the windows in the committee rooms on the basement floors; a direct light will be admitted through the upper half of these side windows, twenty-six in number in the House and twenty-two in the Senate, as well as a borrowed light through seven of the end windows in the Senate chamber, and through nine of the end windows in the House of Representatives. The upper half of the sashes will open on pivots, and when open will admit the air through the halls from the exterior atmosphere, but which will never be required in consequence of a sufficient supply of better air being at all seasons within command by means of the above arrangement; besides, open windows would of necessity damage the acoustics. These windows would be hid from exterior view by the erection of the high parapet, (called an attic in architecture,) on which will be placed the present balustraded battlement, and which is recommended in Senator Foot's report as necessary to relieve the present bad effect of the upper monotonous straight line of the whole building, which is at variance with Roman architecture, (the style of the Capitol building.) The increased elevation of the wings is further called for in consequence of the enormous size of the new dome, (copied from the dome of St. Paul's in London,) the new dome of the Capitol being fully one-third larger than it should be if constructed in accordance with the rules which govern the order of Roman architecture to which the Capitol building belongs. A dome is a prominent ornament to a classic structure, but always subordinate to the proportions and style of the building; but in our case the building is made subordinate to the dome. The published remarks of an educated northern tourist are particularly applicable, when he terms it, "The great dome, with the low buildings beneath, which form the Capitol of the United States." The base of this new dome is actually made to project beyond the front walls of the building, and rest on the projecting portico which forms the principal entrance to the rotunda. To elevate the wings will in some measure disguise this architectural blunder.

Thus it will be perceived that by this one plan two great objects will be effected—better light will be given and better proportions to the halls, and at the same time it will materially improve the exterior architectural appearance of the building. (See accompanying sections and elevations.)

The new windows will be filled in with stained glass, which will produce a soft and agreeable light.

It is proposed to light the Senate chamber at night by means of eight circular burners of Frink's patent, with powerful reflectors, one placed over each; and the House of Representatives with thirteen circular burners, having a reflector over each, by which means the light can be increased to any amount desired, and the present objectionable heat from the great number of unprotected burners on the ceiling will be altogether done away with, as there will be placed over each reflector a copper dome, surmounted by a copper chimney eight inches in diameter, passing out vertically through the roof, which must attract all the heat upward, while it reflects all the light downward; to elucidate which the undersigned submits the accompanying drawings of Frink's patent reflectors, which he would recommend as the best means of lighting the halls of Congress.

The air which this plan introduces through a register from the upper air-chamber into the open space between the glass ceiling and the new counter-ceiling, will increase

the draught upward from the burners under these reflectors and over the glass ceiling, through the flues over the reflectors, which will remove the possibility of communicating any heat from the burners to the glass ceiling, while the counter-ceiling will protect the glass ceiling from the influence of heat or cold from the exterior atmosphere.

The undersigned begs leave to submit a drawing of Reigart's improved fan-wheel, by which he proposes to supply and control the pure air to be furnished to the halls, and to draw the vitiated air therefrom.

He also begs leave to submit specifications and detailed estimates for the construction of the different works more fully described by the plans for the alterations, which he has the honor to submit, in obedience to the instructions of the honorable joint committee.

To remove all apprehension upon the subject, the undersigned would respectfully state that these plans will not interfere with the present condition or appearance of either of the halls below the level of the present glass ceiling, while the arrangements above will establish better architectural proportions, symmetry, and beauty to these halls—a desideratum which he trusts it will not be considered out of place for him to say would have been effected in the original construction of the north and south extensions of the Capitol had his plans been fully and fairly carried out.

Desiring to confine this report to a plain and simple statement of what has been required of him by the joint resolution and the directions of the joint committee, the undersigned has omitted to introduce any reference to the authorities sustaining the principles of the plans which he has the honor to propose; but to aid the judgment and strengthen the opinions of this honorable committee and those of the honorable members of the two Houses, who are so deeply interested in the subject-matter under consideration, he would beg leave to append notes, communications, and reports of high authorities, thereby removing the idea of any presumption on his part of presenting a plan whose principles had not been fully approved by science and practical experience, and which approval the undersigned made himself fully aware of before he submitted his first design, in answer to the published invitation to the architects of the United States, in the year 1850, by practically investigating the different systems for ventilating public buildings in Europe, in particular the Bank of England, the United Service Club House in London, the new British Houses of Parliament, the Millbank Penitentiary, and the Pentonville Model Prison. He investigated the system of ventilation adopted in the two last-mentioned establishments under an order from the home secretary, Sir James Graham—which order will be found recorded in the visitors' book during the summer of 1845—a copy of which could be had upon application in London, which would at once prove his practical experience of this system which he has throughout advocated. Under these circumstances, the undersigned can with confidence assure the honorable committee that there can be no possible doubt as to the result, and it will be possible to successfully carry out the necessary alterations during the interval between the end of the present Congress and the regular annual meeting of the next Congress.

For the more minute and particular explanation of his plan, the undersigned begs leave to submit the following drawings, viz:

Senate Wing.

No. 1.—Plan of sub-basement floor, showing the alterations.
No. 2.—Plan of basement floor, showing the alterations.
No. 3.—Plan of the principal and upper floors, showing the alterations.
No. 4.—Longitudinal section of wing, showing the alterations.
No. 5.—Cross section of wing, showing the additions.
No. 6.—Section showing the vertical air-passage.
No. 7.—Plan of air-ducts over the ceiling.
No. 8.—Front elevation of north wing, showing the attic.
No. 9. Drawing of Reigart's improved fan-wheel.
No. 10. Drawings of Frink's patent reflector.

House of Representatives.

No. 11. Plan of sub-basement floors, showing the alterations.
No. 12. Plan of basement floor, showing the alterations.
No. 13. Plan of principal and gallery floors, showing the alterations.
No. 14. Longitudinal section, showing the additions.
No. 15. Cross section, showing the alterations in roof.
No. 16. Section showing the vertical air-passage.
No. 17. Plan of the air-ducts over the ceiling.
No. 18. Elevation of the south wing, showing the additions.
No. 19. Estimate, &c., from competent parties.

All of which is most respectfully submitted by

CHAS. FRED. ANDERSON,
Architect and Civil Engineer, Washington, D. C.

DECEMBER 5, 1864.

REPORT OF CAPTAIN MEIGS.

OFFICE OF THE EXTENSION OF UNITED STATES CAPITOL,
Washington, May 19, 1853.

DEAR SIR: Having verbally, in my interview with the President and yourself, fully explained the proposed changes, with the aid of large drawings, showing the accommodation to be afforded, it is not necessary here to enter into detail. [*These were the drawings furnished by C. F. Anderson.*]

I will only repeat my own conviction, that the proposed change will secure a better room for speaking and hearing, and better accommodations for the members and officers, and business of the House.

I have prepared some notes upon the application of the general principles of acoustics and ventilation, which have guided me in devising the plan which I propose. They contain the views I expressed to you verbally, and which I propose to write out for submission to some gentlemen of eminent scientific reputation.

While I feel confident that I am correct, I shall be happy to be sustained by their approval if right, and will be much better satisfied to be corrected if wrong, than to be permitted to go on and fail in so important an undertaking.

The changes which I recommend in the plan of the south wing, in order to carry out the above views, are shown upon drawings which have already been explained to you.

I would like to have an opportunity to show them to the gentlemen to whom you will refer these notes.

To lay down general principles correctly is not sufficient security that the application of them will be judiciously made.

I am, sir, very respectfully, your obedient servant,

M. C. MEIGS,
Captain of Engineers in charge of Capitol Extension.

Hon. JEFFERSON DAVIS,
Secretary of War.

Extracts from "Notes on Acoustics and Ventilation with reference to the new halls of Congress," by Captain Meigs, United States Corps of Engineers, May, 1853.

Experience shows that the human voice, under favorable circumstances, is capable of filling a larger space than was ever probably inclosed within the walls of a single room.

If sound be prevented from spreading and losing itself in the air, either by pipe or an extensive flat surface, as a wall or still water, it may be conveyed to a greater distance.

A pure atmosphere being favorable to the speaker's health and strength, will give him greater power of voice and more endurance; thus indirectly improving the hearing by strengthening the source of sound, and also by enabling the hearer to give his attention for a longer period unfatigued.

The common mode of warming and ventilating public rooms is fatal to perfection of hearing.

One or several columns of intensely heated air are introduced through holes in the floor. Being much warmer than the air of the apartment, they immediately rise to the ceiling. If the exit apertures for foul air are above, this fresh and heated air above escapes, having done nothing for the apartment except to cause whirls and currents, such as we see in a column of smoke passing from a chimney on a calm day. The irregular refraction of sound through these currents of equal density tends greatly to produce confusion.

If the exits for foul air are below, the hot air accumulates at the top of the room, and, gradually displacing the cooler air, forces it out through the passages.

Professor Reid relates that he has found the air near the ceiling of a room at the boiling temperature, while those on the floor were complaining of cold.

Here we have a strata of different densities and unequal refractive power, and hence confusion of sound.

As the warmer air must ascend to the top of the room, I propose to let it do so in a large trunk outside of the apartment, pass into a space above the ceiling, and thence, by numerous holes, find its way, as through a sieve, into the room.

By a steam-driven fan, or other mechanical means, we can pump air, in any desired quantity, into any spot into which we choose to direct it.

I would drive all the air required for the supply of the room through a maze of hot-water pipes, raising the whole of it to the temperature desired—60° or 80°, as the case might be.

If the room be 30 feet in height, and it be desired to change all the air in it every fifteen minutes, enough air should be pumped in above to cause a general descent of the whole body of air in the room, at the rate of two feet a minute.

This would be an imperceptible current. The exit should be by numerous holes in the floor, perhaps through the carpet, or the risers of the platforms on which are the members' chairs.

Three important advantages would thus be gained: The avoidance of all eddies, a nearly homogeneous and tranquil atmosphere, and the immediate removal downward of any dust from the carpet, which would thus be prevented from rising, to be inhaled into the lungs.

To prevent the disturbance and contamination of the atmosphere by the gas-lights, I would place them above the glass of the sky-lights—the space between those in the ceiling and those in the roof being separated from the chamber into which the fresh air should be admitted.

In summer the same apparatus which sends in warm air in winter would supply a constant breeze; and, if the temperature of the external air was too high, it might be cooled by jets of water from pipes in the passages, or even by melting ice.

I feel confident that, by observing the above prescribed precautions, we will obtain rooms as near perfection as is possible—"rooms in which no vitiated air shall injure the health of the legislators, and in which the voice from each member's desk shall be easily made audible in all parts of the room." [*This was Mr. Anderson's plan.*]

This was the problem proposed to me for solution.

In conclusion, I have the honor to repeat the request made verbally some days since, that the above notes and observations may be submitted to some persons of scientific reputation, the weight of whose authority may sustain me if I am right, or correct them if wrong.

Respectfully submitted to the honorable Jefferson Davis, Secretary of War, by his obedient servant,

M. C. MEIGS,
Captain of Engineers, in charge of Extension of United States Capitol and Washington Aqueduct.

Subsequently, the subject having been referred to Professors Bache and Henry, those gentlemen addressed a communication to the Secretary of War as follows:

SIR: The undersigned have examined, as you requested, the principles proposed by Captain M. C. Meigs, of the Corps of Engineers, with reference to the acoustics, heating, and ventilation of the hall of Representatives.

They are now prepared to report that the principles presented to them by Captain Meigs are correct, and that they are judiciously applied.

They are of opinion that the plans should be provisionally adopted, in order that the building may not be delayed, subject to such modifications in the details as may result from the further study of them by Captain Meigs, or from the experiments and observations of the commission.

This general adaptation of the plans will not, it is believed, interfere with any changes of details likely to be found desirable.

Very respectfully, yours,

A. D. BACHE.
JOSEPH HENRY

Hon. JEFFERSON DAVIS,
Secretary of War.

ESTIMATES.

Senate chamber—abstract estimate.

Altering roof and raising ceiling, &c	$27,979 20
Scaffolding and machinery for all work	10,000 00
Brick-work in raising the chamber walls	11,929 05
Air-ducts over the ceiling, two thicknesses	5,593 00
New windows round Senate chamber	3,600 00
Belt course under the windows	784 00
Gutters and eve cornice	3,700 00
Remodelling flank roof and gutters	5,000 00
Workmanship on attic walls and balustrade	37,500 00
Mason's work in alterations air-shaft and tunnel	20,000 00
New steam-engine	2,000 00
Two new fan-wheels	3,000 00

Eight reflectors, fixing, and pipes	$9,600 00
Rearranging, rarefying steam-pipes, &c	5,000 00
Lining upper air-chamber so as to make it water-proof, with hot and cold water-pipes and sieve the entire length	5,000 00
	150,685 25

The above calculations are made at the present prices for labor and materials.

CHARLES F. ANDERSON,
Architect and Civil Engineer.

Hall of Representatives—abstract estimate.

Altering roof and raising the ceiling, &c	$38,970 10
Raising the brick walls round the hall	13,925 45
New windows round the hall	4,400 00
New belt course under windows	928 00
Air-ducts over ceiling, two thicknesses	6,783 00
Gutters and cave cornice	4,500 00
Remodelling flank roof and gutters	6,000 00
Workmanship on attic wall and balustrade	37,500 00
Alterations in mason's work, air-shaft, and tunnel	15,000 00
A new steam-engine	2,000 00
Two new powerful fan-wheels	3,000 00
Thirteen reflectors, including fitting and pipes, &c	15,600 00
Rearranging, rarefying steam-pipes, &c	3,000 00
Lining upper air-chamber so as to make it water-proof, with hot and cold water-pipes and sieve	5,000 00
Scaffolding and machinery	10,000 000
	166,606 55

The above calculations are made at the present prices for labor and materials.

CHARLES F. ANDERSON,
Architect and Civil Engineer.

Estimates and proposals for altering and raising the roofs and ceilings of the Senate chamber and hall of Representatives; the brick walls surrounding these apartments, and the windows within these walls; the large air-chambers with their water arrangements; the air-ducts over the ceilings, and the workmanship of covering the roofs complete; also all necessary scaffolding, and temporary roofing for protecting the interior of these chambers during the progress of the work; all to be done substantially, in a workmanlike manner, and completed in strict accordance with the plans and printed specifications prepared by C. F. Anderson, architect, and subject to his approval.

In altering these roofs, it is proposed to use the main ties in their present form, as these are known to be composed of excellent material, and to have been tested to the extent of ten thousand pounds strain to the square inch of cross section; but the rafters and braces will be altered, and made to conform to the improved roofs, and there will be seven-eighths added to the size of the rafters, so as to give to them a cross section of fifteen square inches—seven inches more than the old rafters have. This will make their strength *practically* equal to that of the ties with which they are connected, which is not the case with the old rafters; having only eight inches in cross section.

The engineer of the old roofs made a grave mistake in making the sizes of the ties and rafters nearly equal. He seems to have acted upon the theory that, as the tensive strains in the ties and the pressure in the rafters are about equal in magnitude, and as it is known to require about equal magnitudes of positive and negative forces to crush wrought iron by pressure, and to tear it asunder by tension, that therefore the sizes of the rafters and the ties must also be equal to give to them corresponding strength. But he seems not to have considered the facts developed in practice, that rafters formed and acted upon as in these roofs, will fail by lateral deflection under much less pressure than is required to *crush* the material of which they are composed, and that the corresponding amount of tension due to the ties cannot, by deflection or distortion of any kind, impair their normal strength. Therefore, though *theoretically* right as to the magnitude of the forces acting in opposite directions in the rafters and in the ties, yet, in not providing for the difference in their effects, has resulted in *unscientific* construction, in roofs that have, practically, not more than half the strength that theory assigns to

them. This error will be obviated in the proposed roofs by adding seven-eighths to the size of the rafters, while the ties remain unchanged.

For the purpose of ascertaining to what amount of strains the parts of the modified roofs may be subjected, and thereby determine the sizes and strength required for each part, I have made a computation of the weight of the roofs, with the ceilings, and such other parts as will be sustained by the roofs; and I find these to be equal to 53 pounds to each square foot of horizontal surface covered, to which I add ten pounds to the foot for possible loads of snow—total, 63 pounds to the foot. This is a large allowance for snow in this climate, and the high and open position of these roofs will preclude the possibility of drifts collecting upon them. The roofs, thus loaded, will produce tensive strains in the ties equal to 8,784½ pounds to the square inch of cross section, and 4,685 1-15 pounds pressure to the square inch in the rafters; which is only about one-seventh of the ultimate strength of good iron. The other parts will be similarly proportioned as to size of parts of the strains.

SENATE CHAMBER.

Altering roof, raising it, and the ceiling, as per plan	$27,979 20
Gutters and eave-cornice round the raised roof	3,700 00
Brick walls around chamber, as per plan	11,929 05
Scaffolding and temporary roofing so as to protect the old work	10,000 00
Remodelling flank roofs and gutters, as per plan	5,000 00
Lining upper air-chamber, so as to make it water-tight, with hot and cold pipes, and sieves	5,000 00
Air-ducts over ceiling, two thicknesses	5,593 00
New windows around the chamber, as per plan	3,600 00
Belt course under these windows, as per plan	784 00
Mason work in tunnel and in new air-shaft	20,000 00
Rearranging rarefying steam-pipes, &c	5,000 00
Work on attic walls and balustrade	37,500 00
	136,085 25

I will execute this work, as above set forth, for the sum of $136,085 25, and will give ample security for the due performance thereof.

BENJAMIN SEVERSON, 359 *E street.*

WASHINGTON, *December* 2, 1864.

HALL OF REPRESENTATIVES.

Altering roof, raising it and the ceiling	$38,970 10
Gutters and eave-cornice round the raised roof	4,500 00
Brick wall around the hall, as per plan	13,925 45
Scaffolding and temporary roofing for protection	10,000 00
Remodelling flank roof and gutters, as per plan	6,000 00
Lining upper air-chamber so as to make it water-tight, with hot and cold water pipes, and sieves	5,000 00
Air-ducts over ceiling, two thicknesses	6,783 00
New windows around the hall, as per section	4,400 00
Belt course under these windows, as per section	928 00
Mason work in tunnel, and air-shafts, also alterations	15,000 00
Rearranging rarefying steam-pipes, &c	3,000 00
Work on attic walls and balustrade	37,500 00
	146,006 55

I will execute this work as above set forth for the sum of $146,006 55, and will give ample security for the due performance thereof.

BENJAMIN SEVERSON, 359 *E Street.*

WASHINGTON, *December* 2, 1864.

NOTE.—While these pages are going through the press, the attention of the committee is directed to an elaborate report upon ventilation by Messrs. Shedd and Edson, civil engineers, to a committee of the Massachusetts house of representatives, dated January 1, 1865. Copious extracts from this valuable paper are given in the succeeding pages, upon the questions of moisture in the air and the downward movement in ventilation. The views presented by this committee in the foregoing report receive in

those extracts an intelligent and weighty indorsement. The actual and successful application of the downward movement by General Morin in the hall of the Conservatory of Arts and Trades, and by Mr. Gurney in the houses of Parliament, and in court-houses and other public buildings in England, must be regarded as satisfactory and decisive in favor of the conclusion to which the committee have arrived. In fact, the current of authority at this time, as well as sound reason, is for the proposed plan.

Extracts from the report on ventilation of J. Herbert Shedd and William Edson, esquires, civil engineers, made to a committee of the Massachusetts house of representatives, Boston, January 1, 1865.

MOISTURE IN AIR.

Scientific and medical authorities generally concur in the opinion that in-door air after heating. should contain nearly the same proportion of moisture as the average of out-door air of the same temperature; but when air is brought in from out of doors at a temperature of zero, and raised by heaters to 68°, it would require the addition of of $4\frac{348}{1000}$ grains of water per cubic foot of air to bring it up to the required degree of moisture. For the proper moistening then of fresh warmed air introduced at the rate of twenty cubic feet a minute for each one of three hundred persons two hours, the air taken at zero and at the average degree of moisture, no less than fifty-nine gallons of water would require to be added.

* * * * * * * * * *

Exactly how much vapor, or what per cent. of moisture, is the most healthy, has not yet been determined. From much observation, we have taken 65 per cent. of saturation as the amount most likely to prove healthy.

The mean relative humidity of the air at Philadelphia for the year 1863 was 67.2, and the mean annual average for twelve years, 68.5.

THE DOWNWARD MOVEMENT.

The essential point of ventilation is constant change of air, the removal of the air that becomes laden with the secretions of the body, and its replacement by fresh air. In nature this change is generally effected by currents of wind that rapidly sweep away and renew the air. In addition, according as the air is cooler than the body, the portion coming in contact with the person is warmed, and, becoming lighter than the rest, has a tendency to rise and give place to new air. This tendency is shown by a sensitive wind-wheel, in low temperatures, at the distance of a few inches from the body.

The heat of the breath also has been assumed to be the special provision for its removal and replacement with fresh air. This has been a favorite theory even among scientific men. Mr. Gurney was one of the first to stoutly deny the fact; in his testimony before committees of Parliament in 1854, he asserted that the downward propulsion which the breath received by the position and direction of the nostrils did not cease, so far as the impurities with which it is laden are concerned, till it deposited them on the ground. We have not been able to verify Mr. Gurney's assertion, that on a frosty day the vapor from a person's mouth may be seen to describe a parabolic curve to the ground; but any one may see the vapor of the breath driven from the nostrils taking at first a downward course. A breath of fair strength, with the thermometer near the freezing point, may be seen by its condensed vapor, driven downward and slightly outward, for a foot or more. The subjoined sketch is an accurate representation of the visible breath seen in air of 26° Fahrenheit, the rate of breathing being twenty-one to twenty-two times a minute. [The figures omitted.]

In this observation, the wind-wheel moved rapidly near the body, and steadily at a distance of six inches in front, and also at two feet above the head. Notwithstanding this upward current, the breath was strongly marked by the condensed moisture, fourteen inches below the nostrils, and would doubtless have been seen further down but for the dissipation of the moisture. In a room with the air at 65°, the same wind-wheel was in motion close to the vital parts of the body, but stopped entirely at two or three inches distance from the body, or above the head. This was to be anticipated, because the force that carries the wheel is the rising of the air in consequence of its greater heat and lightness than that of the surrounding air, and is proportioned to the difference of temperature.

In order to determine the amount of heat operating to cause the air to rise, a thermometer was placed within the clothing near the vital parts of the body, where it was found to stand at 82°, while the person remained in air at 65°; on going into air at 20°, with additional clothing, the thermometer stood at 76°. The air around the body in a warm room, therefore, would rise with a force not far from 17°, while in outer air at

20° it would rise with a force not far from 56°. In point of fact, we suppose the air would rise with a velocity somewhat less than these figures, but, relatively, we think they are nearly correct. A more sensitive instrument would have been affected at a greater distance, but the same wheel showed a distinct downward motion of the breath 15 inches below the nostrils, in opposition to all the rising tendency, by reason of the warmth of the breath and of the air about the body; and this motion also would have been shown to a greater distance by a more sensitive wheel.

Let us now suppose, to be well within bounds, the breath to be moved 12 inches below the face. The downward motion having ceased, the upward motion should then begin which is to carry the breath up out of the way. This old breath has about one second in which to rise, from rest or reverse motion, more than 12 inches, in order to be out of the way at the next inhalation. The difference of temperature necessary to give the breath this movement of 12 inches in the first second, if the breath rises by heat alone, will surprise any one not familiar with such calculations. It is not less than 180°; that is to say, the breath, in order to start from rest and rise 12 inches in one second through air at 65°, would have to be at a temperature of 245°.

The absurdity to which this calculation and experiment reduce the idea that our breath is carried away from the face by its upward tendency from heat, is increased by the observation, which every one may make, that a thermometer at 65° cannot be raised more than 1° by breathing upon it at 9 inches distance, and that at 10 inches no effect can be perceived. But the upward tendency of the breath is doubtless much increased from the diffusion and lightness of its aqueous vapor, and possibly from other causes, though, under the most favorable circumstances, all causes combined are not sufficient to carry the expired breath up out of the way before another inhalation, as may be seen on a frosty day; and it is evident to all that the air contaminated by the body, if carried upward, must in some measure be inhaled.

The fact, then, in regard to the removal of the expired air from the face is rather the reverse of the theory that it is carried upward out of the way. It is carried downward at ordinary temperatures with force, as of a steam-jet, that, for aught we know, deposits it with its impurities, as Mr. Gurney says, at the floor. Though we have not traced its descent more than a third of the distance, a calculation of its downward impulse shows it to be sufficient to overcome all the upward tendency of its own heat, and that of the air about the body to a considerably greater distance than that of the floor. The supply of fresh air for inhalation comes in from above and about the face, to supply the partial vacuum created by the downward jet; and in this jet, as Mr. Gurney has pointed out, not in the upward tendency of the warm breath, is the admirable provision of nature for carrying away the expelled air before more is to be inhaled.

We are not, however, to conclude that the rising force imparted to the air about a person, by heat of skin and lungs, is absolutely nothing, although in warm rooms it is practically of small account. More heat is given off from the body by radiation than by contact of air. Inclose a person in a non-conducting cylinder not much above his size, and the accumulation of heat about him would give some force to the air. And so, in an assembly, the heat accumulated around and among the persons gives the air a certain amount of rising force. Taking for a basis Péclet's estimate of the amount of heat given off by an individual in moderate temperature, the upward force given to air by three hundred persons in an hour would be equal to the power of five pounds of coal. This is an extreme outside calculation of the force of the heat imparted by the body. If the usual deductions should be made for the wasteful manner of this application of heat to raise the air, less than half this amount of coal would be seen to balance the elevating effect on the air of three hundred persons.

Yet, on the assumption of an effective lifting power in the heat given off from the body has been based the prevailing system of ventilation—that is, of taking the fresh air in at the bottom of the room and the foul air out at the top. This is claimed to be the natural system, and, therefore, the cheapest and best. The claim is admissible in cases where no power exists to change the air except this slight difference of temperature; but what becomes of it in cases where tons of coal are burned a day for the sole purpose of producing a power to move the air, and where, as is common, all the air taken out at the top is brought down again in pipes to the ground before being sent off through a chimney shaft? Is it not more natural, cheaper, and better to go on as nature begins, and take the foul air of breath and body directly down through the floor to its exhausting chimney?

These two theories of ventilation have been often argued and both practiced with varying success. We will consider the circumstances of a large hall of assembly, and show the operation of the two systems.

We must suppose a floor well packed with people, at the bottom of a cubical or hemispherical hall; suppose them to have entered at once, the hall being previously filled with pure air; directly the whole lower stratum of air, in which the audience are, is contaminated by their exhalations and emanations. Now, the problem is to get that stratum of air out of the hall before any of it can come to use again, and to replace it with fresh air of the right temperature. It is obvious that it cannot be taken out side-

ways, because then many would have to breathe over again the breath of others. It can be taken only either up or down. If it is taken up, the fresh air that is to supply its place must enter at the floor from which the foul air rises, for no air will leave a spot till other air is ready to fill its place. In order then to lift the whole of the foul air bodily from the floor, it is necessary that the whole floor should be open for the admission of fresh air. Wherever there is a piece of solid floor through which the air cannot pass, there will be a dead space of foul air above it, which will not rise with the rest, but will remain to be gradually mixed with the fresh air entering around it. If the dead space is considerable, the whole amount of air required must enter in the limited space of the openings, and the velocity must be proportionately increased. According as this space is reduced and the velocity increased, the air entering has a force that carries it up beyond the place where it is to be used, and mixes it with the foul air passing off; a part of which mixture will return in counter-currents and gradually replace the air in the dead spaces. The operation may be seen by a simple experiment.

Take a bucket-full of turbid water and lower it into a tub of clear water of equal temperature and density. If the bottom of the bucket could be removed without disturbance, the sides might be lowered gently and the clear water would replace the turbid water in the bucket completely, without much mixing. So, too, if the bottom of the bucket is entirely perforated, leaving very slender partitions between the perforations, the clear water may replace the turbid with little disturbance and mixing. But if the perforations are limited to holes of, say, half the space in the bottom, on pushing down the bucket the clear water will rush up into the midst of the turbid water, and the turbid water on the solid spaces of the bottom will remain, till, mixed by friction and counter-currents with the pure water, it is gradually carried up. The fewer and smaller the holes the longer the turbid water will remain in the dead spaces; and if its turbidness is from a constant source, it will be likely to increase rather than diminish.

Dr. Reid, the most scientific and experienced, perhaps, of the advocates of the upward system, seeing this necessity for introducing his fresh air through the whole extent of the floor, when, after experience in the temporary houses of Parliament, he was called upon to arrange the ventilation of the new House of Commons in Westminster palace, had the entire floor made of perforated iron. This was afterward covered with haircloth carpeting, and through nearly its whole extent the fresh air was admitted. No expense was spared, and the system was tried for some years under the most favorable circumstances. The result was that on account of the raising of dust by the entering air, and still more on account of the uncomfortable draughts brought up against the honorable members' legs, nine-tenths of the floor came to be covered with sheet lead under the carpet. And when the entrance for fresh air was thus limited, it being through the carpet but a fraction of the nominal extent, complaints became so loud both of strong currents and of foulness of air that the whole matter of ventilation was turned over to Mr. Goldsworthy Gurney, who undertook it on the opposite system of introducing the fresh air above and taking out the foul air at the floor.

In the French Senate chamber, formerly supplied with fresh air through the rising steps behind the members' seats, these openings were closed because of the draughts about the senators' legs, and, according to Morin, in 1862, they had no ventilation at all.

Such are some of the difficulties of changing the air of a crowded hall by introducing it at the bottom and taking it out at the top. To avoid them, Sir Charles Barry, the architect of the new houses of Parliament, introduced his main supply of fresh air in the House of Lords through the middle compartment of the ceiling, expecting it to descend to the floor, then to rise at the sides, and to be taken out in the side compartments of the ceiling. This was expecting too much of atmospheric nature, and, after a few years' trial, this hall, too, was given over to Mr. Gurney, who proposed to take the air out at the floor. We shall not dwell on the system of taking both the fresh air in and the foul air out at the top, or on that of taking the fresh air in and the foul air out at the bottom, because these systems, to be equally effectual, must double the amount of current that would be caused by taking the air in one way and out the other, and are for that reason not to be recommended for large halls, where the great difficulty is to change the air fast enough without making unpleasant currents.

Introducing the air at the upper part of a hall and taking it out at the bottom, known as downward ventilation, has certain obvious advantages: 1. It takes the emanations of the skin and lungs out of the room immediately after they are given off, before they have a chance to be inhaled. 2. Consequently, the fresh air coming unimpaired directly to the heads of the audience, a much less supply is required to secure the freshness of what is inhaled than is necessary when the air is brought first to the feet or becomes mixed with foul currents. 3. The warm air introduced has the opportunity of spending something of its heat on the ceiling and walls before it comes to be breathed, instead of being breathed at its highest temperature. 4. The fresh air is diffused over the whole area of the hall, even if introduced through few apertures,

before reaching the audience; by which means the air is brought upon them more gently than if it came directly upon them through limited apertures. The greater the number and area of apertures for the exit of the foul air at the floor, the better, and the less will the current be felt. But this current, being downward, will always be felt in a much less degree than a similar current upward about the legs, for obvious reasons; and the dust and odors of the floor will be carried down instead of up into the air to be breathed.

For illustration of downward ventilation, take, as before, a bucket of water, turbid near the bottom, and sink it in a tub of clear water. Suppose the bottom to be well perforated, or even but partially so, clear water coming in at the top, as the bucket is raised, will force out the turbid water very effectually at the bottom, whatever may be the position of the openings at the top. In other words, air passing through a room will drive out more thoroughly and uniformly the air at the side at which it goes out than that at the side it enters.

The gain effected by bringing the fresh air to the face, to be breathed before it sweeps the body, is quite important. It may be estimated by considering how much less supply of fresh air would be sufficient for a man inclosed in a cylinder just large enough to hold him, in case the air came down to his head first, than in case it came to his feet first, and up by his body to the face. A crowded assembly may be considered as a set of such cylinders, closely packed together, with their occupants like bees in their cells. The great advantage, in point of economy of freshness, of sending the air downward, instead of upward, is here very apparent; and it is obvious that in the one case may be obtained perfect purity of the air, while in the other it can never be more than an approximation.

The heating of the walls, ceiling, floor, and furniture of a hall is of great importance. Otherwise, very hot air will not suffice to keep the occupants comfortable. If, as in most cases, this heating is to be done by the warm air alone, the more there is accomplished before the air is breathed the less will be the comparative heat of the air entering the lungs.

This we consider in itself a decided advantage, and it is obtained in greater degree when the warm air is introduced above than when it enters at many points through the floor.

When the air is introduced at the top of a hall and drawn out at the bottom, it is rapidly diffused through the whole upper space, and then begins to descend slowly and very uniformly to the floor. This is the case even at present in our Representatives' hall, where the warm air enters at a single opening above the Speaker's chair. This air rises at once into the dome of the hall, as seen by experimental balloons, where it is quickly diffused, and then descends almost vertically in all parts of the hall to the floor. This arrangement, though designed only as a temporary and experimental step to the still better plan of introducing the air directly into the dome, proves, in a degree, that much greater gentleness and uniformity of motion, with freedom from needless currents, may be obtained with downward ventilation than it is possible to have with upward ventilation; for, in the latter, the rising air can occupy but very much less space, must have, at the level of the audience, proportionally greater velocity, and must alternate with additional counter-currents.

The objections to the downward system are: 1. Its supposed antagonism to the natural laws of upward movement of heated air. 2. The supposed greater heat of the upper air in the hall under that system.

The first objection we have already sufficiently considered. Practically, even those who favor upward ventilation admit that there is no difficulty in taking the foul air out at the bottom by the application of a moderate force; and nothing in the art of ventilation is more universally admitted than the necessity, under any form of ventilation, in all public buildings, for the employment of some special power.

Nor is the objection strengthened materially by the common impression of greater foulness at the top than at the bottom of a crowded room. There is some truth in this impression in regard to rooms which have no ventilation, though most careful experiments by eminent chemists fail to show any considerable or uniform increase in carbonic acid in the upper part of crowded halls; perhaps as many experiments have shown the greater amount at the bottom as have shown it at the top. What slight increase there may sometimes be at the hottest state, is probably more than lost as the heated carbonic acid cools, and, to some extent, sinks from its weight. Sensitive observers, too, have found that though the upper portion of a heated, ill-ventilated hall smells most offensively, and, from its heat, is oppressive, the lower portion most seriously affects their state of health. In our Representatives hall there has been the most serious complaint of oppression on the lowest portion of the floor, around the Speaker's desk. In point of fact, we believe, the idea of the greater foulness of air at the top arises mainly from crowded evening assemblies, where the heated products of combustion from gas-lights contaminate the upper air to a great extent.

It is of the utmost consequence that these products should have some direct means of removal. This is provided for in the best ventilated halls by so disposing the gas-

burners that they may have direct and independent outlets for their smoke and gas. Another obvious explanation of the frequent greater impurity of the upper air in crowded, ill-ventilated halls is that, without special force of supply, there is always a rush of fresh air into the hall through the doors as they are frequently opened; this air being cooler, of course, forces the warm foul air upward. After all, the greater heat at the top of the room is probably the chief cause of the impression of greater foulness, though with the heat may be associated some light odorous gases. But all this is of no importance against systematic downward ventilation. When the foul air is taken off at the bottom, it is no longer found in excess at the top.

Morin's very accurate experiments in the smaller hall of the Conservatory of Arts and Trades, ventilated from above downward, show, on the average, a scarcely perceptible difference between the temperature of the air above and that below. In our own Representatives hall, where now the warm air is introduced thirteen feet above the Speaker's platform, and the foul air taken out at the floor, though the arrangements for supply and exhaust are, at present, quite limited and much less than we should desire, we have found as the average of over five hundred observations in eighty-six different positions, with the exhaust ducts open, the temperature opposite the gas-burners above the gallery only about two and one-half degrees above the average throughout the hall; while that of the lower seats was not two and one-half degrees below the average. When, however, in the midst of these observations, the exhaust ducts were temporarily closed, the difference soon doubled, though the whole average temperature was slightly lowered.

To give these results more in detail:

Observations in level planes.	Ventilating ducts.	
	Open.	Closed.
Average in dome of hall	78°.5	85°
Average opposite gas-lights above gallery	71°.46	73°.54
Average opposite gas-lights below gallery	68°.57	66°.50
Average in the seats	66°.63	63°.72
Average throughout the hall	68°.86	68°.17

It is essential to the system of downward ventilation, as well as to all other systems, that a constant current should be maintained by keeping the inlet and outlet always open. When less heat is desired, the change must be effected, not by stopping the warm-air inlet, but by letting into it cooler air. And when the heat of the room goes off too fast, especially when it is empty, the heat may be economized by letting the air at the floor back into the heating chamber instead of out of doors.

In support of the downward system we will only refer to Mr. Goldsworthy Gurney's testimony before the committees of both houses of Parliament who has for the last ten years had charge of the ventilation of the houses of Parliament, and who has introduced the downward system with great success in court-houses and other public buildings in England; to the book of Mr. Ruttan, of Canada, who has introduced the system most successfully in railway cars, on some of our roads, as well as in buildings; and to the conclusions of General Morin, well known for his valuable scientific works on different departments of engineering, and the author of the latest and most elaborate work on ventilation, (Études sur la Ventilation, Paris, 1863, 2 vols., 8vo., pp. 1017.)

General Morin says, in treating of the ventilation of large halls:

"The numerous observations which I have gathered, and which any one may repeat, have shown me, as I have already said, that there are very sensible inconveniences in making the new air, warm or cold, enter near the occupants of a hall.

"This air is always necessarily at a temperature different from that of the hall; warmer, if it is desired to raise or even sometimes to maintain the inside temperature, as is the case in winter, to compensate the cooling effect of the walls, and when there are few present; and, on the other hand, cooler, if the outer temperature is somewhat high, and if there are many occupants.

"In the one case, as in the other, the neighborhood of the apertures for the entrance of air is disagreeable, and, whatever care is taken to limit the velocity by giving the apertures the greatest possible extent, it is seldom that the velocity can be less than 1.3 to 1.7 feet per second, from which there is sometimes an uncomfortable sensation."

After referring to the experience in the English House of Commons, and to that in the French Senate chamber, in both of which the apertures for the admission of air had been gradually closed, because of the objectionable currents, till ventilation had almost ceased, General Morin continues:

"It does not seem to me, then, suitable for amphitheaters, or for any other place of

a similar kind, to admit the new air through the floor, by the steps or the step-risers. On the contrary, here as elsewhere, the air should be made to enter as far as possible from the audience; and as it may be often necessary the same day, and from time to time, to vary the temperature of the air admitted, within certain limits, arrangements must be adopted which will render the mixing of warm and cold air as complete and as easy to modify as possible, before it comes in contact with the audience. This, it must be said, is the most delicate condition to well fulfill, and amphitheaters are, perhaps, the case in which the difficulty is presented in the highest degree.

"After having reflected much and observed well the various effects of the introduction and evacuation of the air, this is the solution which has seemed to me the surest, and which I have settled upon for the amphitheaters of the Conservatory of Arts and Trades. It has already been applied to one of them as completely as the local conditions would permit in a building of old construction. The vitiated air being that which it is necessary to draw out, it is desirable to hinder it from diffusing in the hall, and consequently to extract it at the spot where it is vitiated, that is to say, as near as possible to the individual occupants, through perforations in the risers, or backs of the steps, in order to make it pass out under the amphitheater.

"The introduction of fresh air presents two principal phases, quite distinct.

"In the first, which precedes the arrival of the people, the amphitheater should be brought up to a moderate temperature, which may, however, be raised to 64°.4. At this moment it is evident that the movement of air from inside to outside of the hall should be, in general, completely interrupted; and in order that there may be established throughout the hall a suitable temperature, it seems natural to allow the warm air to be introduced then by passages communicating with the heaters and opening through the floor at the lowest points.

"In the second period, on the contrary, soon after the entrance of the audience, and according to their number, more or less, we must extract a portion of the air now vitiated and more or less heated, and replace it with pure air. But this fresh air would be, as is daily observed, very uncomfortable if its temperature were much lower than that of the air of the hall, and especially if it flowed in too near the audience.

"From this results: 1. The necessity of introducing the fresh air first into a receiver, which we call the mixing chamber, where, by the simultaneous entrance of hot air and cool air, in proportions which can be easily regulated, the means are kept of admitting into the hall only air of the desired temperature. 2. The obligation, not less imperative, to place the openings for the admission of this fresh air as far as possible from the audience—that is to say, about the ceiling of the amphitheater, if the circumstances of the place permit, or at least at a considerable height. In general, whenever the construction will permit, it is preferable to bring the fresh air through the ceiling or the cornice by openings so proportioned that the mean velocity of the air will not exceed 1.3 to 1.7 feet per second."

The general rules adopted by Morin are as follows:

"1. Place the exhaust orifices as near the points where the air is vitiated as possible.

"2. Have as many orifices of exhaustion as the construction of the building will admit of.

"3. Orifices of exhaustion should be so proportioned that the velocity of air passing through them may be from 2.6 to 3.3 feet per second.

"4. Unite the different groups only by entering them into the common conduit, or into the chimney of exhaust, and as far as possible from their openings into the rooms. Arrange in such a manner that they can be easily examined and repaired. Protect from cold.

"Do not place the orifices for the entrance of fresh air near the floor; it is proved, in the French Senate, that where the orifices were near the floor, currents of *warm* air, having a velocity of from 1.3 to 1.7 feet per second, were disagreeable; currents of cold air should be avoided for much stronger reasons.

"The above is agreeable to the conclusions of both French and English engineers."

The whole discussion of the matter of ventilation before committees of Parliament for twenty years, ending some ten years ago, is full of interest and instruction; through it all Mr. Gurney appears in behalf of downward ventilation, in opposition to Dr. Reid, who, for that time, was attempting to ventilate the houses of Parliament satisfactorily on the upward system. When, in 1854–'55, the committees of both houses determined to give their ventilation into the hands of Mr. Gurney, they seem to have adopted the conclusion of Mr. Robert Stephenson, who, himself a member, was examined by a committee of the House of Commons in 1852, and testified that for a crowded hall he preferred downward ventilation, unless the gas-light should interfere; and that it was as easy to draw the air out downward as upward.

Dr. Morrill Wyman, whose little treatise on ventilation contains more scientific and sensible information on the subject than almost any other book in the English language, though he gives assent to the prevailing theory of upward ventilation, says:

"There is no impossibility, however, of producing a constant and equable downward movement, which shall also effectually prevent all respired air from being again pre-

sented to the organs of respiration. The first movement of expired air is from the mouth, horizontally, and from the nostrils, downward, before it begins to rise; consequently, a downward current may, without much difficulty, be brought to bear upon and remove it."

As regards the manner of applying power to effect the change of air, it is sometimes applied to the exhaustion of the foul air, and sometimes to the supply of fresh air. Either way is effectual in a degree, but neither alone accomplishes quite all that is to be desired. Forcing the fresh air in abundantly will drive out the air already in the hall at every outlet, and it is essential for security against the intrusion of cold currents through cracks and doorways. But it will drive the air out mainly at the easiest outlets, and some of the most important may be neglected, because of being out of the easiest way for the air to pass. The only sure way to get the air out just where you want it to go out is to apply an exhausting force at the outlets, to guide and assist the expelling force. The filling method is called the plenum method, and the exhausting the vacuum method. Much has been said about the superiority, for working vigor, of air in a plenum, or over-pressure condition. There is no doubt of the fact that under a high atmospheric pressure a man has greater power than under a low pressure. But the amount of superior pressure that can be obtained in a common hall is very slight, and can hardly have a perceptible effect. A nearly even balance of the filling and exhausting forces, making the in-door barometer about the same as the out-door, but with the filling force enough in excess to keep out all air seeking to enter without leave, is the most economical and satisfactory condition to obtain.

WARMING AND VENTILATING THE CAPITOL.

Letter from the Secretary of the Interior, in answer to a resolution of the House of the 4th instant, transmitting a report of T. U. Walter relative to warming and ventilating both houses of Congress.

DEPARTMENT OF THE INTERIOR,
Washington, D. C., May 7, 1866.

SIR: I have the honor to acknowledge the receipt of the resolution adopted by the House of Representatives on the 4th instant, directing the Secretary of the Interior to communicate to the House the report made to him by Thomas U. Walter, late Architect of the Capitol Extension, on the warming and ventilation of the two houses of Congress, with the reports of Professor Joseph Henry and Dr. Charles M. Wetherill, accompanying the same.

In compliance with the resolution, I transmit herewith a communication on the subject to which it refers, addressed to me on the 4th instant by Mr. Walter, and the papers accompanying the same.

I am not aware that Mr. Walter, during his official connection with this Department, made any report in relation to warming and ventilating the Capitol. The papers now sent are, it is presumed, those called for by the House.

I am, sir, very respectfully, your obedient servant,

JAS. HARLAN, *Secretary.*

Hon. EDWARD MCPHERSON,
Clerk of the House of Representatives.

REPORT ON THE WARMING AND VENTILATING OF THE UNITED STATES CAPITOL, BY THOMAS U. WALTER, ARCHITECT.

WASHINGTON, D. C., *May* 4, 1866.

SIR: During the last session of Congress it was deemed expedient to institute a series of experiments to ascertain, by accurate scientific tests, the actual results of the means employed for warming and ventilating the United States Capitol extension; and, in order to render the proposed investigation entirely reliable, and to secure its accomplishment in accordance with the most recent developments of physical science, the aid of Professor Joseph Henry, of the Smithsonian Institution, was obtained, and, at his suggestion, Dr. Charles M. Wetherill, an eminent chemist, was employed to conduct the investigations. The report of Professor Henry, together with that of Dr. Wetherill, containing an elaborate record of the experiments and their results, are hereto appended.

It will be proper for me to preface these documents with a brief description of the apparatus by which the buildings in question are warmed and ventilated, and at the same time to furnish some statistics illustrating its power and efficiency.

The system adopted to accomplish these objects consists in drawing a given quantity

of pure external air into chambers formed for its reception by means of fans, where it is warmed by passing around and among stacks of pipes heated by steam-boilers, and forced into the halls of Congress, the adjacent rooms, and the passages and corridors throughout the building, through apertures in the floors and walls, thus producing what is called *a forced ventilation*. The column of air thus introduced displaces, of necessity, an equal quantity of vitiated air, which escapes through apertures in the ceiling and the numerous doors leading into the halls and galleries.

The fans employed to effect this object are four in number—one for each of the halls of Congress, and one for the committee-rooms and passages in each wing. These fans are moved by steam-engines of admirable construction and great beauty of finish.

The fan for the Senate chamber is 14 feet in diameter, and weighs 6,536 pounds; it is moved by an engine of about 16 horse-power, and delivers about 1,000 cubic feet of air at each revolution. It is capable of being run up to 60 revolutions per minute, which is the maximum velocity required for summer ventilation. At a rate of 30 revolutions per minute, which is the minimum speed required for winter, it delivers in the Senate chamber 30,000 cubic feet of pure air per minute, which is 20 cubic feet per minute for each individual, assuming the number of persons in the chamber to be 1,500. This is greatly in excess of what is actually necessary to preserve a healthful and agreeable atmosphere.

The hall of Representatives has a fan of 16 feet in diameter, weighing 9,050 pounds, and is moved by a steam-engine of 30 horse-power. This fan delivers about 1,250 cubic feet of air at each revolution, and admits of being run up to 80 revolutions per minute, thus delivering 100,000 cubic feet, or 3½ tons of air per minute. The hall is 139 feet in length, 93 feet in width, and 36 feet in height, which makes its contents equal to 465,372 cubic feet; hence, a volume of fresh air is forced into it every *five minutes* which more than equals its entire contents. This is for summer ventilation. Half this quantity of air is introduced per minute for winter ventilation, which, it should be observed, is warmed on its passage, thus applying, in cold weather, a quantity of warm air equal to the entire contents of the room every *ten minutes* during the sessions of Congress.

The committee-rooms, the clerks' rooms, the passages, and the corridors throughout both wings of the Capitol are warmed and ventilated in the same manner as the halls of Congress. Each wing has a separate fan for this purpose, of 14 feet in diameter, weighing above 5,000 pounds, and capable of delivering 50,000 cubic feet of air per minute, which is the maximum quantity required for summer ventilation. These fans are each driven by an engine of 16 horse-power, and are capable of being run up to 60 revolutions per minute.

The air to supply the fans is all drawn from the side of each wing next to the center building, at the level of the terraces west of the connecting corridors, through ducts, or areas, opening into the fan-rooms. These entrances for the admission of air to the building are therefore shut out from the streets on the north and south, thus avoiding the introduction of dust, and the terraces on which they are constructed are 60 feet above the Avenue. The purity of the air cannot, therefore, be doubted. It has been objected that the heat of these terraces in the summer materially affects the air, particularly in the north wing, but it has been proved by experiment that such is not the case to any appreciable extent. When it is considered that a mass of air equal to 50 feet square by 24 feet high, viz, 60,000 cubic feet, is drawn into the building, and forced into the Senate chamber every minute during the summer sessions, it is not to be supposed that any perceptible difference could result from the heated surfaces of the terraces. In order, however, to test this question, an inclosure of wood was raised around one of the apertures to the height of 30 feet, and the rate of the thermometer was found to differ very little from what it was before the inclosure was made. If the entrance of the air into these apertures, or areas, was not accelerated by the machinery inside of the building, and if its passage to the halls of Congress was simply dependent on gravitation, or the relative weights of air at different temperatures, as is the case where impelling machinery is not employed, the movement of the air would then be so sluggish as to render the heated terraces a very serious objection, and they might well be a cause of complaint; but in view of the facts of the case as before stated, it is obvious that the present arrangement for the ingress of the air into the air-chambers is all that could be desired.

After the air is drawn into the building and heated on its passage around the various stacks or pipes, or cooled by artificial showers in the main ducts, as the case may be, it is conveyed to the halls of Congress, and to all the rooms and passages throughout the building, by means of smaller ducts, composed of bricks laid in cement and well plastered. These ducts constitute a complete system of distribution, by which the admission of the air to every part of the building is regulated and equalized. The velocity of the draught which is constantly passing through these ducts renders anything like a collection of stagnant or unhealthy air a thing impossible.

The air is admitted into the rooms by perforated bronze registers, covered on the under side with wire gauze, and so arranged as to be under the control of the mem-

bers. These registers are so numerous, and so well distributed throughout the rooms, as to admit of the ingress of 100,000 cubic feet of air into the hall of Representatives, and 60,000 cubic feet into the Senate chamber, per minute, without producing unpleasant draughts, or interfering in the least degree with the acoustic properties of the rooms. For the winter-heating and ventilation of the Senate chamber 30,000 cubic feet of air are assumed as the usual quantity delivered per minute. The sum of the areas of the openings for the ingress of heat is 250 superficial feet; hence the inflowing air has a velocity of 120 feet per minute, or *two feet* per second, which is, however, reduced by diffusion immediately upon its escape into the rooms. I have heard no complaints from the members of either House of uncomfortable draughts since the apparatus has been perfected, nor have I been able, from my own observation, to discover any; it therefore seems to me that the manner of introducing the air for warming and ventilating the building is entirely unobjectionable. As to the quantity of air introduced, there can be no doubt that it is greatly in excess of the requirements of the halls, even when they are filled to their utmost capacity.

With these remarks, I submit the reports of Professor Henry and Dr. Wetherill, hoping that these documents may lead to a better understanding of the system of warming and ventilating the Capitol, as well as to a general diffusion of knowledge on this important subject.

I have the honor to remain, sir, with great respect, your obedient servant,

THO. U. WALTER,
Late Architect of United States Capitol Extension, &c.

Hon. JAMES HARLAN,
Secretary of the Interior.

REPORT ON THE WARMING AND VENTILATING OF THE UNITED STATES CAPITOL, BY PROFESSOR JOSEPH HENRY.

SMITHSONIAN INSTITUTION,
Washington, May 4, 1866.

DEAR SIR: In accordance with a request made by you, while in charge of the Capitol extension, to have the air of the Senate chamber and hall of Representatives subjected to a critical scientific examination, and to be furnished with any facts bearing upon the result of the present system of ventilation, I respectfully submit the following remarks, together with the report of Dr. Wetherill:

Understanding that your desire was to obtain independent testimony respecting the efficiency of the present system of ventilation of the Capitol in comparison with facts in regard to this subject obtained from experiences in this and in other countries, it was concluded to institute the following investigations:

1. To determine the chemical condition of the air from different parts of the halls after they have been occupied by the members of Congress and the usual audience.
2. To ascertain the temperature of different parts of the rooms at the time they are occupied.
3. To find the hygrometrical condition of the air of the halls in comparison with that of the external atmosphere of a similar temperature.
4. To trace any currents which might interfere with the ventilation or the comfort of the occupants of the halls.
5. To collect such facts from the bibliography of the subject as may be applicable to your inquiries or generally interesting to those who are practically engaged in the business of ventilation.

My own time was too fully occupied with official duties and other important engagements which had been devolved upon me by the Government, to permit me to give more attention to the subject than that of general discussion and occasional advice. The labor of the investigation was intrusted to Dr. Wetherill, who was in charge of the laboratory of the Smithsonian Institution, and who, in the accompanying report, has given an account of his own experiments and a statement of his conclusions, together with a synopsis of the results obtained by the principal investigators of the present day in this line of research. The whole forms, in my opinion, a valuable contribution to the important subject of ventilation, which I hope may be rendered generally available for the use of the public.

The part of the investigation to which I gave most attention was that which relates to the hygrometrical condition of the atmosphere of the halls.

Some observations which I had previously made in regard to this point in my own dwelling-house induced me to consider this as an important element of successful ventilation. The dwelling referred to was warmed by an ordinary furnace, in which the air was heated by contact with a cylinder of hot iron. The inmates frequently complained of headache and other unpleasant sensations. I could perceive no reason upon

established scientific principles for adopting the ordinarily received hypothesis of a deterioration of the air by contact with hot iron, other than the production of an extremely small quantity of carbonic acid from the floating particles of organic matter; but the burning of these would seem to render the air more pure by the destruction of any miasmatic effluvia which might be present. I was therefore led to suppose that the effects complained of might be principally due to a deficiency of moisture in the warm air; and upon subsequent investigation with the psychrometer, and the means of increasing the quantity of vapor, the truth of this hypothesis was, in my opinion, fully confirmed. Instead of producing a small quantity of vapor by exposing a surface of about three square feet of water to a temperature of from 90° to 100° in the air-chamber, as had been previously done, an abundant supply was furnished by means of an iron tube connected with the water-vessel and inserted through the side of the furnace into the midst of the burning fuel. The steam generated by this arrangement, which was suggested to me by my friend Dr. Torrey, of New York, gave sufficient vapor from the water, which it put in a state of rapid ebullition, to keep the dew-point at any required elevation. With a sufficient supply of moisture, the unpleasant sensations before mentioned were no longer experienced, the temperature was more equably distributed, and a quality of softness and salubrity imparted not before perceived. The increase of moisture prevented not only the undue evaporation of water from the lungs and all the external surface of the body, but also more readily absorbed the heat from the furnace and imparted it to the body, giving the feeling of great warmth with the same rapidity of combustion.

It is evident that the great object of warming and ventilating an apartment in the winter season is to supply it with pure air of the same degree of temperature and the same amount of moisture as that of an open space in a pleasant time in summer. To fully attain this object is a very difficult matter; but the system of warming and ventilation is certainly the best which approximates the nearest to this desirable condition. The heating of the air and preserving it at the desired temperature is the simplest part of the problem; to remove the impure air, and to supply its place with fresh air, without giving rise to unpleasant currents and unequal temperature, is more difficult; to supply the proper quantity of moisture, and to prevent its condensation, is attended with still greater difficulty, particularly when apartments containing a large number of persons are to be thoroughly ventilated. This part of the general problem is, in my opinion, an essential element of proper ventilation, although it has hitherto received comparatively but little attention in this country.

The idea is entertained by some that because the heating of a large volume of air to the required temperature of the room does not abstract the aqueous vapor which it contains, that hence evaporation from a surface of water is not required to render such air salubrious. It should, however, be recollected that when the external air is, say, at the temperature of zero, all of its aqueous vapor has been condensed, with the exception of an almost imperceptible quantity, and when this desiccated air is afterward heated to a temperature of seventy degrees its *capacity*, so to speak, for vapor, is so much increased that moisture exhales into it with great energy from all bodies from which it can be evaporated. A rapid current of ventilation of air in this condition constitutes an artificial sirocco. Dr. Wetherill's attention was, therefore, especially directed to this point, and on a first examination he reported that a constant jet of water, in the form of spray, was thrown into the chamber, which served as a reservoir into which the air was projected from the fans previous to its entrance in the halls; but this arrangement was afterward found to be merely intended to cool the air in summer, and not to supply it with moisture in the winter. For the latter purpose no arrangement was in operation, and consequently the air thrown into the chamber was in a condition of extreme dryness, and to this, and not to the impurity of the air, I would attribute, as a principal cause, the effects which have been complained of by members of both Houses of Congress.

It is conclusively shown, by the experiments of Dr. Wetherill, that the quantity of carbonic acid is not found in any part of the halls in injurious excess. It is true that in some cases, during cold weather, descending currents of air have been observed, due to the cooling of the ascending columns as they came in contact with the under surface of the roof, as was evident from the odor of gas when the burners above the ceiling were first lighted. That there is a tendency to form such descending currents is clear, since unless the air is immediately withdrawn from the space beneath the roof before it is cooled, and thus rendered heavier than the ascending air, it will descend in parallel streams; but to determine how frequent and extensive these currents are, further experiments will be necessary. The effects of them, however, were not perceptible in the analysis of the air by Dr. Wetherill.

On inquiry I found that the same deficiency exists in the necessary quantity of moisture in the air of the Treasury Department, and probably in all the other public buildings of the city. Mr. Rowland, an intelligent clerk of the Attorney General's Office, has partially supplied the deficiency in his room by means of a small gas furnace, which keeps a quantity of water in a constant state of rapid ebullition.

The admission of the proper quantity of moisture into an apartment, and also at the proper time, require careful attendance, since if the air be nearly saturated with vapor, previous to the warming of the walls to the statical degree of temperature at which they are to be retained, a precipitation will take place, and this is especially the case with the windows, although the glass be a bad conductor of heat, yet the panes are so thin that the temperature on the inside is always much lower in cold weather than that of the adjacent walls. This difficulty, however, does not exist in the halls of the Capitol, since they are not lighted by windows in contact with the external air, and it may be remedied in other buildings by double windows. It is true that the supply of the necessary amount of moisture will increase the cost of heating and ventilation, but this is a consideration which cannot, in most cases, be allowed to weigh against health and comfort.

Two methods are employed to supply air for ventilation, one of which is called that of impulsion, and the other aspiration. In the first method the air is forced into the chamber at a lower level, and allowed to escape at a higher. In the second method the air is removed from above by creating a partial vacuum, and supplied below by the pressure of the external atmosphere. I am informed that arrangements were made in the construction of the building by which both these methods could be employed at the same time, and the deficiencies of either thus obviated.

In conclusion, I may state that, as far as the inquiry has been carried, it shows that the means provided for the supply of warm and pure air to the halls of Congress are ample; that I fully agree in opinion with Dr. Wetherill that the principal cause of complaint is the deficiency in the supply of moisture; that in some cases descending currents of air may exist, but that both these causes of disquietude may be remedied without much expense or labor.

It should, however, be observed in this connection that it is impossible to supply the air of a public chamber in such a condition as to suit every individual of a large assembly of persons of different constitutions and bodily vigor. What is agreeable to one may be unpleasant to another. Besides this, however efficient may be the means of supplying air and of regulating the temperature and moisture, it is very difficult to retain it in such a condition as will be most agreeable to the larger number of the inmates of the chamber while the condition of the external air and the number of persons are continually varying.

I have the honor to remain, very truly, your obedient servant,

JOSEPH HENRY.

THOMAS U. WALTER, Esq.,
Late Architect United States Capitol Extension, &c.

REPORTS OF EXPERIMENTS UPON THE VENTILATION OF THE CAPITOL EXTENSION, BY CHARLES M. WETHERILL, PH. D., M. D.: WASHINGTON, D. C., 1865.

Table of contents.

INTRODUCTION.

Nature of the research. Methods of determining carbonic acid, with their advantages and objections Method of Dumas and Bouissingault; of Regnault; of Brunner. The objections of Klasiwitz Mene, and others. De Saussure's method; Mohr's and Gilm's; Pettenkoffer's. Statement of requisites for accuracy in the research. Accuracy of the weights and measures. Capacity and logarithms of the capacities of the air-vessels. Degree of accuracy in closing the air-vessels. Purity of the tests employed. Mode of arriving at the point of neutralization of the test solutions. Determination of the probable error in the analysis. Calculation of the analytical results. Method of determining the moisture.—pp. 141–149.

I.—CONSTITUTION OF THE ATMOSPHERE.

1. *Introduction.*—Subject introduced. Chronological view of eudiometric experiments; of carbonic acid experiments. Composition of the atmosphere by weight and volume. Poggendorf's calculation of the total amount of oxygen in the atmosphere. The proportion of oxygen in the atmosphere. Results of the determination of the atmospheric oxygen, by De Saussure; Bunsen; Regnault; Stas; Boussingault; Dumas and Boussingault. Simultaneous analyses, by Dumas and Boussingault, by Brunner, and by Martin and Brevais. The results of Laskowski; Marignac; Lewy; Verver. R. Angus Smith on the contamination of the atmosphere of Manchester by smoke. Table of oxygen analyses by different observers.—pp. 149–158.
2. *Analyses determining the carbonic acid in the atmosphere.*—Remarks. Dr. Smith's estimate of the contamination of the air of Manchester. Dr. Smith's table of analyses. Determination of the atmospheric carbonic acid, by De Saussure. Schlagintweit on Alpine air; various other observers. Frankland, air of Mont Blanc; Méne, air of Paris; Watson, air of England; Gilm, of Innsbruck. Lewy's analyses; in New Granada; at sea. Table of his analyses in Guadaloupe, in France, upon the Atlantic, in South America, and in Santa Fé de Bogota. Impure air of mines, by Henwood.—pp. 159–170.
3. *Carbonic acid in the air of apartments.*—Analyses of Leblanc, in Paris; table of. Raymond de Luna. Pettenkoffer's in Germany; table of. Péclet's account of the analyses of Leblanc upon the air of cells in the prison Mazas, in France. Lassaigne's analyses in France; Loppen's air of a theater at Ghent. Roscoe's analysis of air of apartments in England. Roscoe's experiments on the escape of carbonic acid through brick.—pp. 170–176.

II.—ANALYSES AND OBSERVATIONS AT THE CAPITOL.

1. *General table of data and results.*—Mean results of carbonic acid in the external air; of the atmospheric carbonic acid by other observers.—pp. 176–183.
2. *Air of the halls of Congress.*—Mean results of their carbonic acid. Tables of the relative amount of carbonic acid—1st, in halls and large apartments; 2d, in schools; 3d, in dwelling-rooms; 4th, in miscellaneous apartments. Conclusions from these tables. Experiments upon the air of a sleeping-room in Washington. Morin's experiments upon the action of chimneys in ventilating dwelling-rooms. Examination of the air of two of the public schools of Washington. Comparison of the proportion of carbonic acid in the air from the top of the dome and from the ground.—pp. 183–186.
3. *The quantity of fresh air introduced by the fans.*—Determination of the amount of ventilation by the chemical method—Roscoe's results. Calculation of the ventilation of the Senate by the chemical method.—pp. 186, 187.
4. *Velocity and volume of the air entering the main duct, House of Representatives.*—Table of results.—pp. 187, 188.
5. *The degree of ventilation existing in some of the public edifices of Europe.*—The French method of determining the ventilation. What has been accepted as sufficient by different authorities. The ventilation of the prison Mazas; of the church of St. Roche; of the Salle des Sciences of the Institute; of the hospital "du Nord;" of the lecture-room of the Conservatoire des Arts et des Métiers, by General Morin; of the Theatre Lyrique, de la Gaité, and du Cirque; of the Chamber of Peers, of France; of the Pentonville prison. Conclusions from these observations.—pp. 188–190.

III.—UPON RESPIRATION.

1. *Products of respiration.*—Quantity of air inhaled. Diffusion endosmosis. Grehaut's experiments on respiration.—pp. 190, 191.
2. *The amount of carbonic acid evolved in respiration.*—Results by different observers; Lassaigne's experiments; Pettenkoffer and C. Voit; J. Reiset; Dr. E. Smith.—pp. 191, 192.
3. *On the direction of the products of respiration after they leave the body.*—Gurney's experiments. Wetherill's experiments with smoke.—pp. 192, 193.

IV.—THE MOISTURE IN THE AIR.

1. *General considerations.*—Effect of moisture on health. Quantity of water exhaled by the skin and lungs. Characteristics of the climates of the United States. The opinion of Desor respecting the influence of the dry climate of the United States upon the manners and customs of the citizens. Absolute and relative humidity. Relations of these to each other and to the seasons. Table of the absolute humidity of saturated air at different temperatures. Cases of very dry air. Upon what depends the rapidity of evaporation of the body. Air cannot be "burned;" cause of the insalubrity of such air. Example of the hygrometric condition of the external air of winter. The proportion of moisture needed for the winter air of apartments. Tables—1st, of the mean relative humidity of Washington; 2d, of Philadelphia; 3d, of the experiments upon the ventilation of the Capitol extension.—pp. 193–200.
2. *The experiments upon the humidity of the Capitol extension.*—The summer experiments discussed: Effect of storms; deductions and remarks; the heating action of the terrace. The winter experiments; the low relative humidity; a sufficiency of moisture would enable a lower temperature in the halls; experiments upon the evaporation of water in the air-ducts; actual amount, in pounds, of water needed for a ventilation of 60,000 cubic feet of air per minute.—pp. 200–203.

V.—MISCELLANEOUS SUBSTANCES IN THE ATMOSPHERE.

1. *Ammonia.*—Results of Horsford, Gregory, Kemp, Fresenius.—pp. 203, 204.
2. *Acid in the air.*—Dr. Angus Smith's experiments upon the acidity of the air at Manchester. Thompson's experiments.—p. 204.
3. *Organic matter in the air.*—Dr. Thompson's observations; those of Dr. Smith on the air of various places; permanganate of potassa for purifying the air; Smith's observations on the different action of the air from the sea-shore and from Manchester upon the blood.—pp. 204, 205.
4. *Microscopisms and germs in the air.*—Pasteur's experiments with gun-cotton. Hoffman and van der Broeck's experiments; those of Schroeder and Deuch. Berthelot's discoveries on alcoholic fermentation; on the specimens of air from different localities, with their power of inducing fermentation. Karsten's discovery of the oxidizing action of the air on organic matters. Explanations of Elliott's and Storer's observations.—pp. 205, 206.
5. *Dust suspended in the air.*—Panchet's observations of ancient and modern dust.—pp. 206, 207.
6. *Microscopic examination of the air of the Capitol.*—Nature of the deposit settling upon glass slides coated with glycerine.—p. 207.

VI.—OZONE.

1. *Nature of ozone.*—Properties; amount in the air is small; tests for; ozone-carriers. The wonderful property of the blood corpuscules in relation to ozone. Discovery of Gorup von Besanez. Contradictory conclusions in respect to the relation of ozone to health. Experiments by the surgeons of the French army during the Crimean war. Dr. Moffat's observations; those of Bineau; of Zenger; of Kosmann; of Posey; of Boehm; of Hozeau; of Rogers.—pp. 207–209.
2. *Experiments on ozone in Washington.*—Preparation of the test-paper. Experiments to obtain a more delicate test. Air of the Smithsonian park ozonized; that of the city not.—p. 209.
3. *The relation of the ventilation of the Capitol to ozone.*—Air entering the fans contains ozone. Effect of the heated coils upon the ozone of the air of ventilation; ozoned air furnished to the halls. M. St. Pierre's experiment upon the production of ozone by ventilating machinery. Antozone, its nature and relation to the hydration of the air.—pp. 209–211.
4. *Resumé.*—Conclusions from the experiments.—pp. 211.

witz, (Liebig u. Kopp, Jahresbericht, ix, p. 308,) who investigated the accuracy of Brunner's apparatus, after making this same objection, found the results to be unsatisfactory and disagreeing with each other for the carbonic acid, because the sulphuric acid tubes employed for drying the air absorb carbonic acid; and in the use of chloride of calcium the tubes become light from its expulsion of chlorine by the ozone of the atmosphere. Méne, (Comptes-Rendus, xxxiii, pp. 39, 222,) who experienced difficulties in the employment of Brunner's method, determining the carbonic acid by the increased weight of a solution of caustic potassa, through which the air was drawn, assigned for cause the difficulty of drying the air perfectly before it reaches the potassa solution. He modified the process by determining the carbonic acid absorbed, by alkalimetry, thus: Having neutralized a solution of caustic potassa by an acid of known strength until it changed litmus, with which it was mixed, to a wine-red, he ascertained how much of the acid was needed to change the color to an onion-red. He thus obtained the quantity of carbonic acid originally existing in small proportion in the potassa solution. A measured quantity of the same potassa solution was then subjected to the air drawn through it by the aspirator, and after the addition of litmus, by determining the acid needed to change the color from a wine to an onion red, the necessary data were afforded for calculating the amount of carbonic acid in the air. Méne states that in his experiments for determining the relative amount of carbonic acid in the atmosphere, taken at different elevations on the Pantheon at Paris, he obtained by Brunner's method 5.1 volumes of this gas in 10,000 of air; while by his own method he found only 2.4 volumes. He then tested the solution of caustic potassa employed in the Brunner experiment by his own method, and found in it 2.5 volumes of carbonic acid, from which he inferred that the 2.6 additional volumes in the analysis by Brunner's method were due to an error which proceeded from water absorbed from the air, and which increased the weight of the potassa solution erroneously. Méne's results will be given in a subsequent part of this report. Otto (Lehrbuch der Chemie, vol. ii, part 1, p. 111) criticises them as unworthy of a high degree of confidence, and the individual experiments appear, indeed, to differ too much from each other; but they are worthy of note as affording a less amount of carbonic acid than is usually accepted as existing in the atmosphere.

There is an error of small extent which attaches to Brunner's method, and which, being in the opposite direction, tends to lessen that stated above. Apparently when large quantities of air are passed over caustic potassa a certain portion escapes absorption. C. W. Elliott and F. H. Storer, (Ch. News, iii, 178,) in their experiments upon the nature of the odorous gas accompanying the evolution of hydrogen from commercial zinc, passed atmospheric air through two long tubes filled with pumice-stone imbued with caustic potassa, and then through three Liebig's bulbs filled with the same alkaline solution, and found that when one hundred and fifty-six liters of air had passed by this route into lime-water, the latter was not, indeed, at once turbid in the Liebig bulbs, but after twenty-four hours a crystalline deposit of carbonate of lime was always formed. It doubtless existed immediately in an amorphous condition, soluble in the lime-water, and afterward separated by crystallization.*

These results may throw some light upon the discrepancies of Méne, who passed ninety-five liters of air per hour through his solutions of potassa, and hence lost some carbonic acid by his method, the loss being more than compensated by the atmospheric moisture communicated to the same solution in the Brunner experiment.

3. Upon the third principle involved in determinations of the atmospheric carbonic acid—viz, the transformation of this gas into a definite compound, which is subsequently analyzed—a large number of results have been obtained. The processes of De Saussure, Thenard, Mohr, Gilm, Pettenkoffer, and others, are founded upon this principle.

De Saussure, the younger, employed large air vessels, of known capacity, which were closed by a screw pressing upon a leather washer. In these he placed, with the air to be examined, at first lime-water, and in his later experiments solution of caustic baryta, which was spread upon the sides of the vessel twenty times daily during eight days. The carbonic acid of the air formed carbonate of baryta, which was filtered off and washed, with precautions against further absorption of carbonic acid from the air; the precipitate was then dissolved in hydrochloric acid. The carbonate adhering to the sides of the air-vessel was dissolved in acid and added to the former solution, from which the baryta was precipitated and weighed as sulphate. This gave the equivalent proportion of carbonic acid by calculation, which was referred to the air-vessel and estimated by volume in 10,000 parts of air. The De Saussure experiments were among the first performed upon the carbonic acid of the atmosphere; they were very numerous, agreeing well with each other, and are quoted and referred to universally at present as authoritative upon the constitution of the atmosphere respecting this constituent. Verver, who performed ninety analyses according to Brunner's method, obtained results

* Karsten (Pogg. Ann., cxv, 343) attributes this formation of carbonic acid to the oxidation of cork, caoutchouc, and organic matter by the air. It is a pity that neither of these operators measured the quantity of carbonic acid present.

identical, in maximum, minimum, and mean, with those of De Saussure. Notwithstanding this agreement, the proportion of carbonic acid is doubtless too large. We have seen the reason for this in Brunner's method to be owing to the absorption of water from the air, or to the difference between this gain and the loss of carbonic acid which passed through the alkaline liquid; or, finally, to these plus the carbonic acid arising from the oxidation of organic matter according to Karsten's experiments. The error of De Saussure's process, if any exist, is doubtless due to the absorption of carbonic acid from the air during the subsequent operations of filtering, &c., to which the carbonate of baryta is subjected.* When we consider the greediness of the baryta solution for carbonic acid, and the extremely small amount of this acid in the air, so that a small additional and erroneous weight for the carbonate of baryta would cause a large error in the composition of the air per 10,000, it is impossible to doubt that the results obtained by this process are too high. Besides, the air is confined for a long time with the alkaline solution, and all leaks of the air-vessel, imperceptible although they be, are so long in operation that they may produce a decided effect upon the increase of carbonic acid. De Saussure's method involves also a great deal of labor in its performance. Mohr, and subsequently Gilm, under the direction of Klasiwitz, have contrived a process which is described in Mohr's Titrir-Methode, p. 445. It combines certain principles of De Saussure's and Brunner's method, and applies the process of measuring according to the system of volumetric analysis, in place of weighing. Instead of confining the air in bottles, it is drawn, by means of an aspirator, through tubes containing hygrometric substances, by which it is dried. It passes thence through a long, slightly inclined tube filled with a mixture of caustic baryta and potassa in solution, and then into a small Woulfe's bottle containing the same alkali, to all of which it yields its carbonic acid, forming carbonate of baryta. This is separated by filtration and washing, with exclusion of air, and is converted into chloride of barium, of which the chlorine is determined volumetrically by Mohr's method, with silver solution. From the chlorine the proportion of carbonic acid is obtained by calculation. It is not necessary to indicate the sources of error to which this process is liable, as they will appear from what has already been stated above. A source of error which applies to all the methods in which the carbonate of baryta is separated by filtration and its baryta determined, arises from the absorption of baryta by the filtering paper. (Dr. Eisenstück, jr., Pr. Ch., lxxxiii, p. 384.) This method, like all in which an aspirator is employed, gives only the mean amount of carbonic acid in the air during the time (several hours) that the aspirator is in action.

Pettenkoffer's process, which has been adopted in this research, appears to combine more of the advantages, and fewer of the disadvantages, of those described above. It enables air to be collected at brief intervals of time; it is of facile execution, and its results agree closely with each other.

Prior to its description by Pettenkoffer, a similar method was proposed by Watson, whose results will be quoted in a subsequent portion of this report. Méne's former process is somewhat similar. This chemist published, subsequently, an improvement, substituting baryta for potassa, in which he appears to be unaware of Pettenkoffer's method of analysis. Pettenkoffer's process consists in introducing into a bottle capable of being closed accurately, and of capacity commensurate with the amount of carbonic acid supposed to be present, 45 cubic centimeters of a solution of caustic baryta containing about 9.3 grams of the crystallized hydrate in a liter of water. These air-bottles contain about 6 liters of air for analyses of the external atmosphere, and half that volume for the ordinary air of chambers. A solution of oxalic acid is prepared of such strength that one cubic centimeter of it will saturate as much of any base as one milligram of carbonic acid. For this purpose 2.8636 grams of crystallized oxalic acid are dissolved in a liter of water, since

$$\text{eq.}(C\,O_2)22 : \text{eq.}(C_2O_3\,3\,H\,O)\,63 :: 1 : x = 3.8636\dagger$$

With this oxalic solution the strength of the baryta solution is determined by seeking how many cubic centimeters of the former are required to neutralize 30 cubic centimeters of the latter to the point that a drop of the mixture will not produce a brown spot or ring upon tumeric paper. The air-bottles are turned frequently so as to coat their interior surface with the baryta solution. At the expiration of two hours the baryta will have deprived the air imprisoned in the bottle of its carbonic acid, forming the insoluble carbonate of baryta, and losing, to a proportionate degree, its alkalinity. Forty-five cubic centimeters of the barytic solution have been introduced into the bottle in order to be able to withdraw 30 cubic centimeters by means of a pipette, and to allow for loss of solution adhering to the air-vessel and for rinsing the pipette. When the process of absorption is completed, the barytic solution is poured gently into a beaker glass, and after rinsing a pipette with some of it, 30 cubic centimeters are withdrawn from the bottom of the beaker. These are neutralized by the requisite cubic centimetres of the oxalic solution, and the difference between this result and the former

---

*Another source of error will be referred to presently.

†In Mohr's Titrir-Methode, by a typographical error, this quantity is stated at 2.409 oxalic acid.

operation upon the pure baryta is noted; to this number half of itself is added to account for the 15 cubic centimeters of the baryta solution left in the air-bottles, &c. The result is milligrams of carbonic acid, which are reduced to cubic centimeters of normal temperature and pressure, and the proportion of carbonic acid for 10,000 volumes of air is then calculated from the capacity of the air-vessel, (less 45 cubic centimeters, the volume of the barytic liquid introduced,) reduced to its normal pressure and temperature.

It will be perceived that this method resembles that of De Saussure, who employed baryta solution in air-vessels; but a much smaller amount of air is taken, which enables the analysis to be performed more rapidly. In addition to this it substitutes the delicate processes of volumetric analysis, and thus avoids the exposure of the alkaline solution to the carbonic acid of the air in filtering and washing the precipitate of carbonate of lime and the absorption of baryta by the paper. It avoids, also, the accumulation of errors of analysis incidental to the greater number of operations employed upon the said precipitate by De Saussure, Gilm, and others, to determine its equivalent in carbonic acid. It avoids the errors incident to the use of an aspirator, as in the processes of Brunner and others, and diminishes the time employed for collecting a given volume of air from several hours to as many minutes.

Pettenkoffer (Jr. Pr., ch. lxxxv, 178) has given the following comparison of his method of analysis with that of Dr. Gilm:

	By the process of—	
	Pettenkoffer.	Gilm.
I. Carbonic acid in 10,000 volumes of atmospheric air	7.40	7.41
II. Ditto	6.11	6.33
III. Ditto	4.52	4.09

The coincidence of results in I is too close to be other than accidental, for Pettenkoffer does not claim a greater accuracy in determining the point of neutralization in adding the oxalic to the barytic solution than $\frac{1}{10}$ of a cubic centimeter, which would give a possible error of nearly 0.1 in the number which represents the proportion of carbonic acid in 10,000 volumes of air. As two acts of neutralization are performed, this error may be either doubled or reduced to zero. If Pettenkoffer's results are correct, whatever errors attach to the use of an aspirator, or to filtration, as practiced by Gilm, apply to his own method, since by a comparison they afforded the same results. I have made some slight modifications of Pettenkoffer's process, which seem to be improvements, and which, together with the reasons for their adoption, will be found in a subsequent portion of this report.

Before proceeding to any determination of the proportion of carbonic acid in the air, an examination was made of the degree of accuracy of the method selected, and of the sources and amount of errors of the processes which have been adopted.

A discussion of this subject involves a consideration of the following points, viz:

1st, the accuracy of the weights and measures; 2d, the degree of accuracy in closing the air-vessels; 3d, the purity of the tests employed; 4th, the method of arriving at the point of saturation of the alkakine solution; 5th, the influence which the probable error in observing the aforesaid point of saturation has upon the analysis.

1. The weights and measures employed in the analysis were the gram (=15.44 grains) and the cubic centimeter, (=0.061 cubic inch.) In passing from the weight of carbonic acid obtained by the analysis to its volume, and in calculating its proportion in 10,000 volumes of air, it is important to have a correct cubic centimeter. This is obtained by the volume occupied by the weight of a correct gram of distilled water at an observed temperature, which volume is reduced to 4° centigrade, by means of the coefficient of expansion of water. The weights and graduated vessels obtained from the best instrument-makers are frequently incorrect, and hence a particular examination of such as were used in these experiments became necessary. The result demonstrated the existence of inaccuracies, which were corrected. A portion of this work was performed in the Bureau of Weights and Measures, and I am much indebted to Joseph Saxton, esq., for his valuable coöperation in graduating the air-vessels with the delicate standard balances of this Bureau. The Bureau of Weights and Measures is the depository of a complete set of standard weights and measures which were presented by the government of France to the United States. These have been compared with the platinum kilogram in the archives of the department of state of France, by M. Silberman, superintendent of the Conservatory of Arts and Trades, whose report upon the subject is contained in the report to the Senate of Professor Bache, Superintendent of Weights and Measures, (Ex. Doc. No. 27, 34th Congress, 3d session, p. 138.) The weights used for the analysis were box No. 798, of Oertling's manufacture. The small weights of the subdivisions of 50 grams were found to be exactly equal to the 50-gram weight, which is itself equal to 50.0009 grams, according to the standard in the archives of the French state department. The air-vessels were graduated by Mr. Saxton and myself, employing distilled water and the large French weights of page 160 of Professor Bache's report. Their volume was calculated for 4° centigrade, and account was taken of the air escaping from the bottles before the second weighing.

All of the other measures—the burettes, pipettes, &c.—were graduated by box No. 798 of Oertling's weights; and the temperature of the water was taken at 17½° centigrade for the standard, according to Mohr's practice in volumetric analysis. Since 45 cubic centimeters of solution of baryta are poured into the air-vessels, this volume must be deducted from the capacities of these vessels, respectively, to ascertain the amount of air taken for the analysis. But a liter, according to Mohr's graduation, measures really 1,001.2 cubic centimeters; hence, 45 cubic centimeters, according to his measurement, would equal 45.05 cubic centimeters, and hence I have deducted 45.01 cubic centimeters from the air-vessels to obtain the quantity of air taken for the analysis. The following table contains this quantity for the bottles, together with their logarithms employed in the calculations:

Table of quantity of air taken for analysis.

Designation of bottle.	Cubic centimetres, less 45.1.	Logarithms C. C. of air.
A	7916.6	3.89854
B	7470.1	3.87333
C	7652.5	3.88380
a	3556.7	3.55105
b	3005.2	3.47787
c	3031.2	3.48161
d	3255.8	3.51266
e	3315.7	3.52058
f	3171.1	3.50121
g	3064.7	3.48639

The full pipettes (Fig. 1) employed in the analysis were graduated by the weight of distilled water at 17°.5 centigrade, which dropped from them; and the error of the burettes was determined by weighing the successive volumes of ten cubic centimeters (read by means of Erdmann's swimmer) which they discharged. The liter measures were also tested and corrected.

2. The vessels (Figs. 1 and 3) for confining the air in contact with the solution of baryta, were closed with accurately-ground glass stoppers. It was deemed important to determine the degree of tightness of these stoppers, so that the air might remain sufficiently long exposed to the action of the baryta without danger of the absorption of carbonic acid from the external air by diffusion. To effect this purpose the stoppers were reground carefully with flour of emery, coated with a film of glycerine and inserted in the bottles, which were then inverted in a vessel of water and placed in a vacuum; by which experiment it was ascertained that the stoppers were perfectly air-tight. This fact was also proved by the following experiment: Three specimens of the same external air were taken and solution of baryta added; of these, B and C were analyzed at the expiration of 3 hours, and A at the expiration of 22 hours, with the following results:

B contained ..... 2.685 volumes of carbonic acid,
C contained ..... 2.719 volumes of carbonic acid,
A contained ..... 2.722 volumes of carbonic acid,

in 10,000 volumes of air. Hence the absorption of carbonic acid was complete at the expiration of three hours, and the delay of a day in performing the analysis did not involve any error arising from the diffusion of carbonic acid external to the apparatus. In consequence of this result, and to insure perfect absorption of the carbonic acid, the specimens of air were always analyzed on the day after they had been collected. The analysis of duplicate or triplicate specimens of external air always agreed closely, and when the bottles containing them were opened in the warm laboratory the expanded air always rushed out with a noise.

In the method described by Pettenkoffer, the baryta solution remaining in the air vessels after the action thereupon of carbonic acid, *is poured out* into a small beaker glass, and after the 30 cubic centimeter pipette has been washed out with a small portion of this solution, it is filled with sufficient of the remainder for the determination of its alkalinity. It would seem that, by such a procedure, there is danger of an increase of carbonic acid by exposure to the air. When the pipette is not protected, the inside of the stem becomes quickly coated with carbonate of baryta, and the act of pouring the baryta must necessarily subject the same to carbonic acid. I sought, therefore, to improve the process by employing a 30 c. c. pipette of sufficient length to reach to the bottom of the liquid in the carefully-opened air bottle (as shown in Fig. 1) from which, after rinsing the pipette, the baryta solution is immediately drawn. In

Pettenkoffer's early experiments the baryta solution was neutralized in the air vessel. The upper stem of the pipette I protected from carbonic acid in the air by a small tube containing a mixture of caustic lime and Glauber's salt. A similar protection extends to the air entering the bottle containing the supply of baryta solution needed for adding to the air vessels. The 45 c. c. pipette is filled from this bottle by means of a glass tube reaching to its bottom and furnished at the top of the tube with a piece of gum-tubing, closed with Mohr's spring clamp. (Fig. 2 illustrates this method of confining and pipetting the baryta solution.) Experiment demonstrated, by daily determinations of its title, that baryta test solution thus preserved maintained its strength unimpaired.

In collecting air for analysis the stoppers were always inserted carefully to avoid compressing the air. The air was introduced into the air vessels by the action of a bellows with an India-rubber tube reaching to the bottom of the bottle, as illustrated by Fig. 3.

3. It is plain that, other things being equal, the accuracy of the results depends upon the purity of the oxalic acid employed. In the described method, this acid, purified by crystallization from oxalate of potassa, is dried in vacuo over sulphuric acid, at the ordinary temperature. If these crystals contain mother-water in their pores or cavities they will have the composition $C_2\ O_3\ 3\ HO + x\ HO$, and will give the result of too much carbonic acid in the air; if the exposure in vacuo at the ordinary temperature of the laboratory is prolonged there is danger of their losing some of the water of crystallization, and thereby yielding too little carbonic acid. The experience of this research has demonstrated the necessity of ascertaining the strength or title of the oxalic acid by a special volumetric analysis, by means of pure carbonate of soda. In this process the oxalic solution was prepared with 2.8636 grammes to a liter of water, as if the acid were pure, and then, by a neutralization with pure carbonate of soda, a factor was obtained by which to multiply the measures of oxalic solution to correct the errors arising from the impurity of the acid. A small quantity of oxalic acid, prepared for the experiments of the summer of 1863, was thus found to be impure from excess of water. A pound of the acid, purchased from Luhme & Co., supposed to be chemically pure, was found to contain binoxalate of potassa, from which it could not be freed by less than four crystallizations, according to Mohr's process. An exposure to sulphuric acid in vacuo was prolonged until it was feared that the crystals had effloresced. The microscope, however, demonstrated that such was not the case; but, upon determining the title by carbonate of soda, the presence of a larger quantity of water than the formula $C_2\ H_3\ 3\ HO$ warranted was ascertained. It resulted from the experiments that this oxalic acid always gave a solution of the same strength, although below the normal one. Its volumetric analysis by the carbonate of soda was effected in the following manner:

A quantity of bicarbonate of soda, purchased for chemically pure, but which contained, by analysis, iron, chloride, and sulphate, was purified and converted into neutral carbonate in the usual manner. Analysis then demonstrated that 2.812 grammes of the salt contained 2.807 pure carbonate and 0.005 sulphate of soda. A solution of this salt was made of such strength that a cubic centimeter would exactly neutralize the same measure of Pettenkoffer's oxalic solution made with pure acid. This requires the oxalic acid and carbonate of soda to be present in the proportion of their equivalents, viz:

63 (eq. oxalic acid) : 53.18 (eq. carb. soda) : : 2.8636 : $x = 2.4172$; but since 2.807 of pure carbonate of soda is contained in 2.812 of the carbonate of soda employed, instead of 2.4172 we must take 2.4215 of this salt, and dissolving it in a liter, we will have a solution which would exactly neutralize a liter of normal oxalic acid solution.

A little more than this quantity of carbonate of soda was ignited in a platinum crucible, and weighed after cooling over sulphuric acid; it was then brought to the exact weight required, then heated again and weighed repeatedly until it was certain that no hygrometric water impaired the correct weight. The salt was then dissolved in an accurate liter of distilled water of 17°.5 centigrade.

Thirty c. c. of this solution were measured at 17°.5 C. into a beaker glass, to which ten drops of the litmus solution, employed in these experiments, were added. This litmus solution was neutralized by nitric acid until it was of wine-red color; forty drops required 0.495 c. c. of the oxalic acid solution to produce an onion-red tinge; consequently ten drops of the litmus would require 0.124 of the acid for the production of this shade of color. By the mean of four experiments it was ascertained that 30 c. c. of the above-mentioned carb. soda solution required 31.323 c. c. of oxalic solution in the corrected burette to produce an onion-red color after boiling. This volume corrected for the alkalinity of the ten drops of litmus is equal to 31.199 c. c., and x $(31.199) = 30$ or $x = \frac{30}{31.199} = 0.96157$, of which the logarithm equals $\overline{1}.9829806$. This experiment was repeated with the same result upon another preparation of oxalic acid solution, and consequently the volumes of this acid obtained in the course of the analyses, from which the amount of carbonic acid was determined, were always corrected by multiplication by the number 0.96157.

4. For determining the point of neutralization by adding the oxalic to the baryta

solution, Péttenkoffer adopted the reaction upon turmeric paper. He states that in employing litmus solution for this purpose he found an uncertainty in determining the point of neutralization, extending from 4½ to 5 cubic centimeters of the oxalic acid solution. In consequence of this he let fall a drop of the solution, at intervals during the progress of saturation, upon a piece of turmeric paper, and arrested the process when a brown ring was no longer visible. As the employment of litmus would facilitate the research, experiments were instituted to ascertain whether it could be used. They resulted satisfactorily, and the following is the improved method adopted. To the baryta solution ten drops of a strong and nearly neutral solution of litmus were added. It is not necessary to take into account either the alkalinity of this litmus or the slight error of the burette, since the carbonic acid is determined by the difference of two reactions which are precisely alike, with the exception of the presence of a precipitate of carbonate of baryta in the second reaction. These two cases neutralize also the error which might arise from an absorption of carbonic acid from the air in pipetting the baryta solution.* The oxalic solution is added until a point is reached when the blue color of the liquid changes suddenly to violet. The beaker containing the solution is then slightly warmed, which expels carbonic acid, and causes the complete subsidence of the precipitate of oxalate of baryta. A microscopic examination demonstrated that this precipitate is as soon as formed, and without the application of heat, crystalline. It now requires a small amount of the oxalic solution to bring the liquid to the desired shade of red at which the operation is arrested. This shade is incipient onion-red. To produce it drop after drop of the oxalic acid is suffered to fall into the almost clear liquid, until the falling drop is no longer visible. The precipitated mixture of carbonate and oxalate of baryta is tinged *blue* by the absorption of the coloring matter of the litmus when the point of neutralization has been reached. If after the neutralization is complete the drops of oxalic acid reach this blue precipitate while suspended in the liquid, the color will be changed to red; but if they fall into the clear liquid, and become thus diluted before mingling with the precipitate at the bottom of the beaker, they will produce no effect upon its color. If the glass containing the liquid be suffered to stand for some time after the completion of the experiment, the precipitate is changed slowly from a blue to a red color. Perhaps it would be of advantage to arrest the operation of adding the oxalic solution at the appearance of the violet color; but the point of the onion-red having been adopted at first, was maintained for all of the experiments. This point has the advantage that the operator is prepared by the advent of the violet tinge to add the oxalic test with caution. None of the experiments were lost by excessive addition of the test acid. There is nothing to prevent the use of turmeric paper, together with the litmus, in its two stages of violet and red tinge, taking the mean result of the three indications; or, if losing the point of neutralization by the turmeric paper, saving the analysis by means of the litmus reaction. In the series of experiments performed in June, 1864, turmeric paper was employed, and the experience derived from the present series has demonstrated the equal delicacy as well as the superior convenience of the litmus solution in analyses of this character. The following experiments, showing the number of cubic centimeters of oxalic solution required to neutralize thirty c. c. of the solution of baryta, arresting the operation at the points indicated above, prove the accuracy of the method adopted:

Number of experiment.	Turmeric brown.	Violet tinge.	Onion-red.
1	Lost.	37.0	37.2
2	36.2	37.0	37.2
3	36.0	36.9	37.2
4	36.2	36.9	37.2

The differences between the turmeric brown and violet tinge are, respectively, 0.8, 0.9, and 0.7. Between the onion-red and violet the differences are 0.2, 0.2, 0.3, 0.3; between the turmeric brown and onion-red they are 1.0, 1.2, and 1.0.

I observed that the point of neutralization could be determined more closely with the baryta solution before than after its exposure to the carbonic acid of the air in the vessels. I have been unable to ascertain, with any degree of certainty, the cause of this, which might arise from a solvent action of the acid upon the carbonate of baryta; but in order to diminish possible errors from this source, I have always arrested the neutralization in the second case very closely to the onion-red tinge, although not quite at this point. If there be any error in such a procedure it would tend to yield a trace more of carbonic acid than is really present.†

*Since the hydrate of baryta employed in preparing the test solution contained carbonate, the filtered test solution is saturated with the said carbonate. *Vide* De Saussure's experiments.

†This would not affect the object of the present report, since the determination of carbonic acid in apartments was always relative to a simultaneous analysis of the external atmosphere.

5. From the foregoing considerations it is apparent that the degree of accuracy of the method depends upon the correctness with which the *point of neutralization* is observed. Experience in graduating the full pipettes employed in measuring the baryta solution proves that they always indicate very nearly the same amount of liquid. The burette furnished with Erdmann's swimmer, and graduated to 0.2 cubic centimeter, may be read very accurately to 0.1 cubic centimeter, or even less. Suppose that a mistake of $\frac{1}{10}$ cubic centimeter be made in determining the point of saturation of the baryta solution. Since considerable uniformity exists in the capacities of the air vessels as well as in the amounts of carbonic acid resulting from the analyses, we may calculate the probable errors of the analyses as follows: In experiment No. 3, of February 8, 1865, by which 2.719 carbonic acid was found in 10,000 volumes of air, an error of —0.1 cubic centimeter of oxalic solution in the neutralization would give 2.622 carbonic acid, or an error of —0.097. One-tenth of one part in ten thousand, or one one-hundred-thousandth, would therefore be the probable error in the determination of the carbonic acid when operating carefully. In nearly every instance duplicate analyses of the air were performed, and the average of the results was taken. It has been deemed expedient to present in this report all of the data afforded by the experiments, together with the method of calculating them, so that, in the event of future improvement of this method of analysis, a recalculation of the results (if needed) may be effected. The calculations were performed by logarithms, and, to avoid errors, were repeated twice, and in some instances three times. In reducing the volume of the air taken for each analysis to 0° centigrade and 760 milimeters barometric pressure in the usual manner, the logarithms for $(1 + \delta\, t)$ and $\frac{B}{760}$, in which B = the barometric pressure reduced to 0° C., t the temperature of the air in air-vessels, and $\delta = 0.003665$, were taken from Marchand's tables. These logarithms were added when B was below 760^{mm}., but when B was above 760 its logarithm was subtracted from the logarithm $1 + \delta\, t$, and the sum or difference thus obtained was subtracted from the logarithm of the air-vessel (see page 14 of this report) to reduce the quantity of air taken to its normal temperature and pressure. The milligrammes of carbonic acid afforded by the analyses were corrected for the abnormal condition of the oxalic acid test by adding to their logarithms $\overline{1}.9829806$. which is the logarithm of the factor 0.96157. The further addition of the logarithm $\overline{1}.7015680$ translated the weights into cubic centimeters of carbonic acid (sp. gr. carbonic acid = 1.5291) of normal pressure and temperature; and the addition of 4 to the characteristic of this logarithm gave the calculation for 10,000 volumes of air. These operations were abridged by adding the constant logarithm 3.6845486 to the logarithm of milligrammes of carbonic acid proceeding from the experiment, and subtracting therefrom the logarithm of the air taken at normal temperature and pressure. The number corresponding to this logarithm gives the volume of carbonic acid in 10,000 measures of air.

The following example of the calculation of analysis No. 46 will sufficiently illustrate the method of computation:

In this experiment the air-vessel A (log. 3.89854) was filled with air of temp. 4° C., at a barometric pressure reduced to 0° C. of 759^{mm}. Forty-five cub. cent. of baryta solution, of such strength that 30 c. c. required 37.5 c. c. of oxalic acid for neutralization, were introduced into the air-vessel, and the stopper, coated with glycerine, was inserted. On the following day 30 c. c. of the baryta solution were removed from the air-vessel; they required 34.6 c. c. of oxalic solution for neutralization; then—

Log. $(1+\delta 4°)$	= 0.00632	Log. A	= 3.89854
Add log. $\frac{759}{760}$	— 0.00057		0.00689
	0.00689		3.89165 log normal vol. air.

Cub. cent.

37.5 title of 30 cub. cent. baryta solution before exposure to carbonic acid.
34.6 title of 30 cub. cent. baryta solution after absorption of carbonic acid.

2.9
+ ½ 1.45 to account for the 15 c. c. baryta solution left in the air-vessel.

4.35 log = 0.6384893

Add 3.6845486

4.3230379
Subtract 3.89165

0.43139 = 2.7 carb. ac. in 10,000 vols. air.

Fig. 4 represents the method of neutralizing the solution of baryta before and after it has been acted upon by the carbonic acid of the air confined in the air vessels. The three-necked bottle contains the normal solution of oxalic acid, which, by pressing the spring clamp attached to the caoutchouc hose connected with the bottle, rises in the Mohr's burette, where it is measured very accurately by means of the Erdmann swimmer. Upon pressing the clamp at the extremity of the burette, the test acid is dropped and measured into the beaker glass containing the baryta solution tinged with litmus. While filling the burette its air passes into the three-necked bottle by means of the hose connected with the top of the burette, and in measuring off the acid, air enters the Woulfe bottle by a water-valve sealed by some of the oxalic solution. By this arrangement a very rapid and accurate neutralization is effected.

EXPERIMENTS UPON THE MOISTURE IN THE AIR.

Cotemporaneously with the carbonic acid determinations, and in some instances without them, the amount of moisture present in the air was ascertained by the difference in temperature of correct dry and wet bulb thermometers. This method by psychrometry was preferred to the more accurate one of Regnault for determining the dew-point, as being sufficiently accurate for the purpose while it enabled a comparison to be made with the results of the meteorological observations of the Smithsonian Institution and of others throughout the country, and at the same time was of very ready execution. The thermometers were all carefully compared before employing them in the experiments. Three pairs were used in the course of the investigation. In experiments 1 to 34 I employed a pair of fine centigrade thermometers belonging to the Smithsonian Institution, and capable of estimating quarters of a degree.

In experiments 34 to 83 I used a pair of centigrade thermometers of German construction, graduated to fifths of a degree, and estimating tenths with perfect accuracy. The instruments placed side by side in iced water stood at 0°, and were found to be equivalent, degree by degree, beyond the highest temperature observed during the research. Placed side by side in the air, and observed for different temperatures during several days, they stood always alike.

Unfortunately one of these thermometers was broken, and reliance was had for the remainder of the observations upon a Mason's hygrometer containing Fahrenheit thermometers. This instrument was compared with the unbroken thermometer used in experiments 34 to 83, and was found to agree with it. It had the disadvantage of rendering fifths of a degree by estimation with difficulty. The results by this hygrometer were translated into centigrade degrees, and all of the calculations for humidity were performed by the use of Guyot's tables. (Smithsonian Misc. Coll.)

A table comprehending the data and results of the determinations of carbonic acid and humidity will be found upon a subsequent page of this report, which position was assigned to it so that we might first consider the observations of other chemists and physicists upon ventilation, after which a comparison and discussion of the results obtained by the present research would follow most naturally.

I. CONSTITUTION OF THE ATMOSPHERE.

I. INTRODUCTION.

In consulting the numerous works upon ventilation placed at my disposal by the Smithsonian Institution, I have been surprised at the sameness of many of them, each author copying much of the matter of his predecessors and adding little new. I have thought, therefore, that it would be interesting to refer to the original investigations and analyses of those who have determined the constituents of the atmosphere, or, where that was impossible, to other publications containing full accounts of such experiments. This an extensive search in the library of the Smithsonian Institution and in my own library has enabled me to do; but a difficulty presents itself in condensing the numerous references within the narrow limits of a report.

The atmosphere plays the main part in ventilation; hence the importance of ascertaining the nature and proportion of its constituents in both normal and abnormal conditions.

What Humboldt says of climate applies to the interior of an apartment occupied by an assemblage of individuals. (Humboldt Fragmens de Climatologie et de Géologie Asiatiques, Paris, 1831:) "The word climate, in its most general acceptation, embraces all the modifications of the atmosphere by which our organs are affected in a sensible manner; such as temperature, humidity, the variations of barometric pressure, the tranquillity of the air, or the effects of the different winds, the electrical charge or tension, the purity of the atmosphere or its admixture with gaseous emanations more or less insalubrious; finally, the degree of habitual clearness, that serenity of sky so im-

portant through the influence which it exerts not only by the irradiation of the soil upon the development of the organic vegetable tissue, and the ripening of fruits, but also by the moral effects which man experiences in the diverse zones."

Notwithstanding the rapid progress of science, we are far from being able to assign its due effect upon the human system of any of the above-mentionted conditions, and we can certainly not produce in the air of an inclosed, occupied space the salubrious conditions of the external atmosphere. It is the object of a well-ordered ventilation to advance in this direction as far as possible with our present limited knowledge.

It was only towards the close of the last century that the nature of the principal atmospheric constituents began to be understood. In 1774 Priestly and Scheele discovered oxygen in the air, and described the properties of this gas, at the same time discovering another constituent of the air, to which, later, the name nitrogen was given. In the same year Bergman detected carbonic acid in the atmosphere, a gas already known to Von Helmont, but which Lavoisier, in 1776, ascertained to be a combination of carbon with oxygen. Scheele observed also the presence of ammonia in the air.

The true nature of water, one of the most important of the aerial constituents, was unknown until Lavoisier determined it in 1783. At that time it was generally believed that water was an elementary body and could be converted into atmospheric air, and conversely, until De Luc (Idées sur la Météorologie) refuted the error by an extended argument. (Meteorologie von E. E. Schmid, p. 14, Karsten Allgemeine Encyklopædie der Physick.) The accurate nature and the quantity present of these constituents was not determined until the present century, and their study is still prosecuted; while ozone and the presence of organic germs and other solid matters, with effluvia, and the nature and effects of respiration, are discoveries of our own day.

The following chronological review of the experiments upon the atmospheric oxygen and carbonic acid, quoted from Schmid, in Karsten's Encyklopædie der Physick, are interesting, showing the progress of the science:

Chronological view of eudiometric experiments.

1774.—Scheele: "The air must consist of two kinds of electric fluids."—Chemical Treatise on Air and Fire, Leipzig, 1777, § 8–23. "Atmospheric air contains, as it appears, a fourth part of purest or dephlogisticated air, about $\frac{3}{4}$ or $\frac{11}{16}$ of phlogisticated air, and about $\frac{1}{16}$ of fixed air."—Id. 5, 216.

1775.—Fontana: Discritzioni ed usi di alcuni stromenti per misurare la salubrita. dell'aria—Firenze, 1775.

Landriani: Ricerche fisiche intorno alla salubrita dell'aria, 1775.

The inferences from these researches, owing to the errors of the nitric oxide eudiometer, were that the amount of oxygen in the air was variable, and was the cause of its healthfulness, on the contrary. Compare Kopp Geschichte der Chemie Bd. 3, S. 209, Braunschweig, 1845.

1778.—H. B. De Saussure performs eudiometric experiments in the southwestern Alps. He employed the nitric oxide eudiometer, and arrived at the incorrect result that the proportion of oxygen is less on the heights than in the valleys.—Voyages dans les Alps, Neufchatel, 1787–1796, § 578, 1,113, &c.

1790.—De Marty is led, by experiments in Catalonia with sulphide of calcium, to assert that the proportion of oxygen in the atmosphere is constant.—Gilb. Ann. 19, 389.

1799.—Berthollet recommends the phosphorus eudiometer, and makes observations with it at Cairo.—Memoires sur l'Egypte publées pendant les campagnes du Géneral Bonaparte. Paris, An. 8, pp. 284—294. In Gilb. Ann. 5, 341.

1800.—Davy's experiments in England confirm the results of De Marty.—Jour. Royal Inst., 1801, p. 45.

1802.—Berger: Experiments in the Savoyard Alps and in the Jura. Comparison of the results of the phosphorus sulphide of potassium and nitric oxide eudiometer.—Journal de Physique, I, 54, p. 366, and Gilb. Ann. 19, 412.

1804.—Dalton finds the air on the peak of Helvelyn, in Cumberland, at an elevation of 1,100 yards, and that in Manchester of the same composition.—Gilb. Ann. 27, 387.

1805.—Gay Lussac, and Von Humboldt: Examination of eudiometric methods. Recommendation of Volta's eudiometer. Experiments in Paris upon the atmosphere at different seasons and in different weather.—Jour. de Phys. I, 60, p. 129. In Ann. 20, 38. "Atmospheric air contains 21 p. c. oxygen gas, by volume, without variation."—Gilb. Ann. 20, 92.

1809.—Configliachi: Experiments upon the southern Alps and Appenines, upon wet meadows and in rice fields, and in apartments filled with persons, yield almost exactly the same proportion of oxygen.—Sull' anâlisi dell' aria contenuta nella vesica natatori dei pesci. Pavia, 1809; also Schweigger, Neues Jour. für Ch. und Phys. Nurnberg, I, 144.

1832.—Brunner: Perfection of the method of determining both constituents of the atmosphere.—Pogg. Ann. 27, 1.

1834.—Brunner: Experiments upon the Faulhorn.—Pogg. Ann. 31, 1.

1840.—Boussingault: Experiments in South America.—Ann. de Ch. et de Phys. Ser. 2 76, 360.

1841.—Boussingault and Dumas: Perfection of the improved methods by their performance upon a large scale.—Ann. de Ch. et de Phys. Ser. 3; 3,257. Abstract in Pogg. Ann. 53, 391.
